EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS.

INV. 1859.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 4, 1874.

VOLUME XXIX Number 1.

Straw-Burning Engines.

The London *Times*, of May 16th, describes at length the visit of the Czar of Russia, Grand Duke Alexis, the Duke and Dutchess of Edinburgh and others, to the Flemish farm, to witness the operation of a straw-burning engine, which is soon to be introduced upon this coast. The engine referred to is the joint invention of Mr. John Head, of the firm of Ransome, Sims & Head, England, and the late Mr. Schemioth, a Russian engineer.

The *Times* says: "Although it is only now that the Czar has seen it in action, it has already obtained the approval of the most competent agricultural authorities. We have already made mention of it in letters we published on the Vienna Exhibition, where it was one of the great centers of attraction in the agricultural machinery hall, and we have no intention now of entering into technical details. We shall merely say the engine is fed by a self-acting apparatus driven by a strap attached to itself. The straw is passed in between a couple of rollers, which spread it out lightly with a lateral and fan-like motion, exposing it to the full force of the fire. One man only is required to supply it, and it reduces the average consumption of straw to something like four times the weight of coal. It is exceedingly simple; and, indeed, its general utility must depend almost entirely upon its simplicity in a country where the laborers have been only accustomed to the most primitive implements, and where the most skilled artisan to be found within reach is probably an ordinary village blacksmith. The trial witnessed by the Czar went off most satisfactorily."

By means of this straw-feeding apparatus, it is claimed that almost any kind of vegetable product can be utilized as a fuel, and thus permit of steam being used as a cheap motive power in countries which are devoid of ordinary fuel, but which are covered with vegetable products. The apparatus for feeding the furnace with straw is self-acting, being driven by a belt from the engine; but if desired, the belt can be disconnected and the apparatus operated by hand; or, when necessary, the entire apparatus can be readily disconnected and removed, and the ordinary furnace door substituted in its place.

In getting up steam it is necessary to operate the apparatus by hand until the engine begins to work. One man can easily feed the straw to the machine, thus requiring no more men than an ordinary steam engine. It is claimed that the average consumption of straw or cotton stalks is about four times in weight to coal, and that about eight or ten sheaves of straw are required to thresh one hundred sheaves of grain.

The apparatus can be adapted to fixed as well as portable engines.

This invention has been secured by American patents. For further particulars, address Ernest L. Ransome, manufacturer of artificial stone, San Francisco, Cal.

Hanscom & Co., of the Ætna Foundry, who recently built the machinery for Capt. Dick Ogden's steam yacht "Quickstep," have just completed the machinery for a new steam yacht belonging to Capt. Wilcox, of San Diego. This little craft is 40 feet long, 10½ feet beam, and will draw only four feet of water. They expect her to attain a speed of 10 miles an hour. The engine is of the overhead A frame description, with cylinders eight inches in diameter and 12 inches stroke. Hanscom & Co. have also finished the machinery for a tiny side-wheel steamer, intended to do service on Lake Tulare, for Messrs. Goldstein. She will be the first steamer on the lake. The paddle wheels are only seven feet in diameter, and the engine has oscillatory cylinders 10 inches diameter and 24 inches stroke.

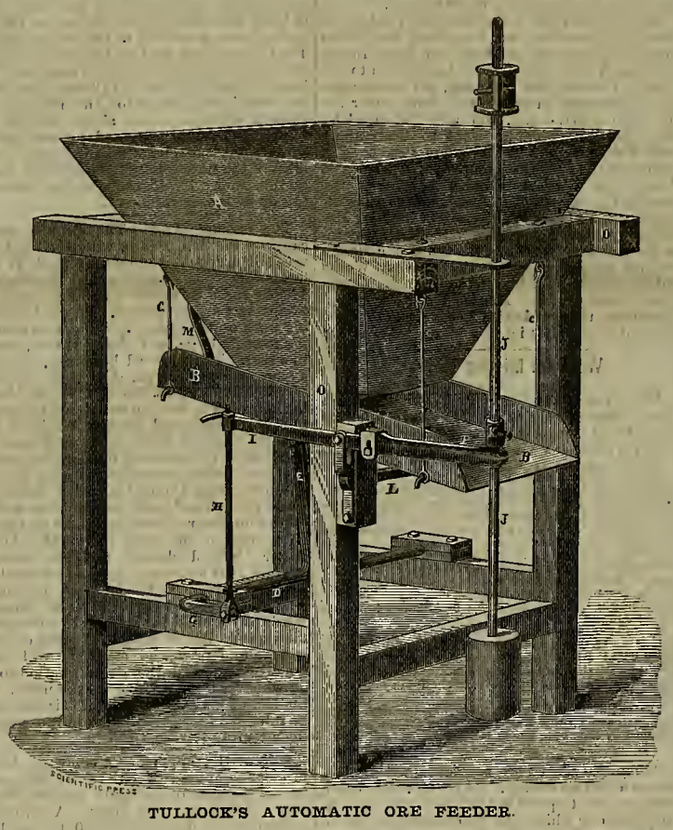
Mining matters in England are dull, and the London *Mining World* says that mines, whose names have been familiar as household words, are being abandoned; and it would seem that the prospects of British mining were never blacker than now. It has, however, been often remarked that the darkest hour is that which precedes the dawn, and the present is doubtless another illustration of the truth of this adage.

Tullock's Automatic Ore Feeder.

We illustrate this week a new device for feeding ore to batteries, recently patented through the Mining and Scientific Press Patent Agency, by James Tullock, of Sonora, Tuolumne county. A tray placed beneath a hopper is given a vibratory motion by means of a rock shaft and arm, and an intervening mechanism, which connects the rock shaft with the stamp stem. The tray is stopped abruptly at the end of each forward vibration, by concussion against a stationary block or bar, so that all trouble by the sticking of damp or wet ore is avoided.

By referring to the engraving on this page, the details of the machine may be noted. *A* is a hopper supported by suitable frame work. Beneath this hopper is the tray, *B*, which receives the ore from the hopper as fast as may be desired, a suitable regulating gate being employed. The tray, *B*, is inclined as much as may be desired, and is suspended by the links, *c*, *c*, from the frame, *O*, so that it can receive an oscillating motion forward and back. Beneath the tray a rock shaft, *D*, crosses the frame transversely, and an arm, *E*, extends upward and is secured by a pin passing through the lugs in the bottom of the tray, and through the slotted upper end of the arm, *E*. The end of the shaft, *D*, has a crank, *G*, formed upon it, and from this crank the rod, *H*, connects with one end of a lever arm, *I*.

The lever is pivoted near its middle to the frame, and the other end extends to a point near the stamp stem, *J*. An adjustable collar, *K*, is secured to the stem, *J*, and whenever the stamp falls, the collar will strike the end of the lever, and through the connecting rod, *H*, the rock shaft will be operated so as to draw the tray back. When the stamp is again raised, the tray will be allowed to swing forward until the lugs on the bottom of the tray strike a bar or post, *L*, which will abruptly stop the tray, and thus tend to loosen and throw forward its contents, this feature being especially valuable when the ore is wet.



TULLOCK'S AUTOMATIC ORE FEEDER.

In practice it is found that the force of gravitation is sufficient to operate these parts, no springs being used; a spring, *P*, is placed upon the end of the lever, *I*, which is struck by the collar, *K*, so as to relieve the strain and transmit the force gradually. Suitable adjustable screws serve to regulate the movements of the different parts, and the amount of ore beneath the stamps will regulate the amount fed.

This ore feeder is in use in several mills on this coast. There are two of them at the Buchanan mill, about eighteen miles east of Sonora, Tuolumne county. Two of them are at the Shawmut mine, and two of them at the Knox & Boyle mill, in Tuolumne county. A. B. Preston writes concerning the operation of the last four, that his mill-men say they are the best feeders they have ever used, being simple in construction and good for either wet or dry crushing. At the Spring Gulch mill, owned by an English company, and situated about sixteen miles from Sonora, Tuolumne county, Cal., they have used them a short time. A letter from this company recommends them highly, saying the machines have given satisfaction. They give them credit for economy in the wear of shoes and dies and the regularity of discharge. They think they will pay for themselves in five months in that respect, where there is constant milling. They are a great saving in every respect. The managers are confident that they have put through two tons of rock per day more, since they have worked these machines than they did before. James Bowden, Vincent Johns, Thomas Whitto, Richard Martin and John Sherwood, owners of the mill, say: "We have been more or less connected with quartz and the milling of it for twelve or fourteen years, and do not hesitate to say that the machine is the best we have seen introduced in a quartz mill, and with propriety we can recommend it to all quartz mill owners."

In Elko county, Nevada, the mines never looked so well, and gave so much promise of permanency as at present, being now worked more earnestly and with a better directed purpose.

Our Holiday.

Although the date of the Press is July 4th, our many readers are not to suppose that the issuing of it has necessitated anything like a desecration of that day; for the busy hands and brains that have toiled all the week in "getting it up," closed the labors of the week on the "night before the Fourth," as the youthful patriots say. And before the "one gun at day-break" gave the formal announcement of the dawning of the glorious day, the Press was on its way to its thousands of destinations far and near. Those of us who have kept "Fourth of July" for half a century have noticed a marked difference in regard to the uniformity with which this holiday is celebrated. Even twenty years ago it was considered optional with the employer whether his workmen kept holiday or not, and many worked of their own choice; sometimes to gratify their greed, and sometimes from a supposed necessity. Now no employer requires his workmen to stick to their tasks on this day, and they would not do it if it were required of them.

The whole country to-day lays aside its cares, runs away from its labors, and throws up its cap exultingly in city and country. Our readers have probably discovered before this, that the Press is not given to croaking on any subject; and they will not be surprised when we declare, as we now do, our belief that the growth of true patriotism among the American people is in full keeping with their increasing power to maintain their liberty.

The Comet may now be distinctly seen by the naked eye in the northern part of the heavens, a short distance below and to the west of the North Star. It is moving almost directly toward the sun, and will pass so near the earth as to form a most brilliant object in the heavens. It will reach its nearest approach to the earth about the 1st of August, when it will be seen in the west only for a short time after the setting of the sun, and very near its point of setting. As its motion is rapidly increasing, with its approach to the sun, it will from this time until it reaches its perihelion (nearest to the sun) increase very rapidly in brilliancy. Still another comet is announced. It is said that Rev. R. B. Fairbairn, D. D., Warden of St. Stephen's College, at Anendale, has discovered another comet, in the vicinity of Jupiter. So it is possible that we may soon be treated to the rare sight of two comets in the heavens at one and the same time.

Pullman Cars in Italy.—A fifteen-year contract has been definitely closed at Milan, Italy, for putting Pullman palace cars on all trains and lines in Upper Italy. This covers the great routes of pleasure travel via the northern lakes. The Italian press highly compliments American progress, and Director-General Amilhan on his enterprising application of public wants.

New Horse Cars.—The car lately built at the railroad shops in Sacramento for the Potrero and Bay View Railroad was received here last Saturday. The car weighs 2,200 pounds, and is 12 feet long. The old-style street car is 16 feet long, and weighs 4,700 pounds. A notable feature is the addition of a patent car-starter, to start the car without strain on the horses.

B. V. Sargent reports that the Monterey coal mining company are actively exploring their mine. Twenty-five feet below the surface, a well defined stratum three 3 in thickness was discovered, and on drifting forty feet on the level it increased in size about an inch to the foot.

Mr. Lytle is obtaining good results in his cinnabar mine, above Trinity Center. Last week forty-five pounds of the cinnabar were placed in a common retort, and from this sixteen pounds of quicksilver were obtained.

The property in Clifton district, or Deep creek, in Utah, known as the Gilberson property, has been sold to a St. Louis company for the snug little sum of $90,000 cash.

The Virginia and Truckee railroad contemplate building a narrow-gauge railway from the head of the Summit flume to Lake Bigler.

Montana Placer Mining.

The Introduction of Little Giants.

Last fall Messrs. W. A. Clark, S. E. Lsrabie, Ed. L. Irvins and Jos. Steele ordsred from San Francisco a No. 3 Littls Gisnt snd No. 16 and 18 iron pipe to work ths Hoover diggings at the head of Squaw gulch, nsar Yamhill. The Flint Creek Ditch and Mining Co. also ordsred a larger size Littls Giant and iron, ssveral thousand fset of box, 15 and 22-inch pips to work their placsrs on Flint creek. During ths winter Mr. F. B. Millsr manufactured the Clark Co's pips, and Thos. Strang the Flint Creek Co's pipe, and ths apparatns for both companies was placed on their grounds early this spring. The formsr company, procuring watsr from the Rock creek ditch, got to work some two or thrss wesks ago, and on Saturday last we rods over to ses it in operation.

We had sxpected mnch of it, but it snrpasses all onr sxpectations. It is mining in earnsst. Compared to it ths ordinary hydranlic is child's play, and it is a question of a very short time when all tha old appliances will bs displsced by the new wherever there is sufficient watsr, pressure, extent of gravel and dump to render it practicable. It not only revolntionizss the old system, but will bring into devslopmant hundrsds of thonsands of acres of ground not available herstofore, and really, we bslieve, hegins the era of big mining in Montana. The theory of it is to substitute and utilizs the power of the water for manual labor. As an illnstration of how it doss this, we cits the Clark Co's claim. The ground was worked a year or two ago by the Hoover Co. with an ordinary hydraulic. It is hard, tough, cemented gravel atrata, so hard to cut that it is said the hydraulic would scarce color the water; that one cave was a good day's work, and sometimes two or three were required to hring one down; that 25 kegs of powder were exploded in it without any very noticeable benefit. And yet it paid expenses hy the old process. With the Little Giant, 400 inches of water is brought down with 250 feet pressure, snd is thrown throughja 4-inch nozzle. When we saw it, it was playing on the gravel at an elevation of 20 or 30 deg. at 125 feet from the fsce, knocking out houlders the size of pumpkins as though they were marbles, and moving, according to the estimate of practical miners, twenty times as mnch earth aa the old method. And this with only five men employed for the 24 hours, againat donble that number required for the old system. It costs less per week to run with 600 inches of water than the old hydranlic dip with 250 or 300 inches. A 27-inch flume at 10 inches grade to 12 feet carriee off the dirt and rock; 100, 200, and we should jndge 300 ponnd bonlders go through without trouhle, and the larger ones are aledged up and follow suit. As soon as the pit is well opened the Little Giant will he set in it, giving 30 feet more pressnre; a larger nozzle will be used, and we presume the entire amonnt of water—200 inches being now used in the ground sluice—will be turned through the Giant. Its power ia amazing; we believe it would knock any ordinary honae to pieces at fifty feet in half a minute. And yet the nozzle ia more easily managed than a common hydraulio.

We presume the Clark mine will pay; it does not make a particle of difference, ao far as the system is concerned, whether it doea or not. That is the way to mine. The questions of there heing gold in the ground, and of saving it, come in as considerations entirely independent of moving the ground from its natural position in a bar through a string of boxee. The Little Giant system does that so mnch more rapidly and economically than the old methods that no miner will hesitate a moment between them. The aimple fact that it moves 20 times as much dirt at less expense, settles the point. The Flint creek company were to get to work thia week. Capt. John H. Rogera and Batterton, Irvine & Co., each have little giants on the road from Corinne, and will have them working in a few weeka on Granite Bar. Billy Winchel came up, saw the little giant work, and was conquered. He has his order for a No. 3 and 4,000 feet of pipe, for his Flint creek mines. They cost with an ordinary amonnt of pipe from $3,000 to $4,000. The ditching in Montana ia inadequate to their general use; hut we venture the prediction that if the Flint creek mines of Clagett & Co. pay, there will he such bar prospecting and ditch building in Montana within a year as was never thonght of before; while many dormant enterprises like the Race Track ditch of Thornton & Co. will become valuable and productive propertiea. We are not generally very enthusiastic about mining enterprises, but the introdnction of this new syatem is worth millions of dollars to Montana. The next thing is to undercurrent riffles to save fine gold. There is too mnch gold goes to dump. We have placed onrselves alongside of California in one kind of appliances; they save all their gold there by another set, while oure goes to wsste. It is a comparatively expensive process. Will not our intelligent and energetic miners follow their grand stride of progresa hy another? We trnst that the new system will not be confined alone to thie connty. We recommend miners elsewhere to come over and look at it and be convinced of its practical advantages, assured that wherever available they will rapidly supersede old processea.—*New North West, June* 13th.

The Board of Regents of the State University have empowered the Building Committee to recsive bids for 10 cottages, to be occupied hy 12 students each, to he couducted on the clubhouse plan, at Berkeley.

The Pioneer Smelters of Eureka.

It is right, says tha Eureka *Sentinel*, that dne crsdit should be given to those who wsre instrumental in proving that onr argentifsrons galena ores could be prcfitably smelted. In the spring of 1869, Major W. W. McCoy had some minsrs at work on Minsral hill, at the north end of what is known as Prospect mountain. These workmen occupied thsir leisnrs time in prospecting, and in June of that year they discovered the Ruby Hill mines. In October of ths previons year, Mr. C. A. Ststefeldt had commenced the ersction of a furnacs, but when it was started np, in the following spring, it failed to do satisfsctory work. Major McCoy, having becoms interested in tha property, and fesling assursd that the ores could easily he smsltsd, endsavored to find some man to undertaks the businsss. On ths advice of Mr. P. K. Roots, now of Arkansas, hut who at that tims was connected with the Orsana Smelting Works, in Humboldt connty, the Msjor becams anxious to secure the ssrvices of R. P. Jones, a Welshman, who, though possessing no scientific knowledge, was said to be an efficient, practical smelter. Hsaring that Jones was prospecting in White Pine district, the Major procsaded thither and sngaged him to come to Eureka; and at his suggsstion, also, secured ths assistance of his conntryman, John Williams. On the way over from Hamilton they stopped to lunch on Pancake mountain, and strolling off a short distance from the road, Jones fonnd a sandstone, which he declared was fire-rock. On reaching Eureka, Jones and Williams were told that they were at libsrty to alter the furnace as they pleased, only that they mnst introduce two additional tweers, Mr. Stetefeldt having put in hut one. A snpply of the Pancake rock waa aent for at once, and being put in as a new lining, its excellent quality as a fire-rock was speedily demonstrated. The furnace was aoon pnt in operation on Ruby Hill ores, and, proving a success, the way waa prepared for subsequent undertakings.

In Novembsr, 1869, Bateman and Bnel leased the McCoy furnsce, and succeeded so well in smelting Champion ore, that two large furnaces, which were afterwarda transferred to the Eureka Consolidated company, were commenced. These new furnaces were built nnder the direction of Mr. Jones, and wera managed by him nntil 1872, when he went to Utah along with Williams, who had for some time heen in charge of the Jackaon company's works. To Jones and Williama, therefore, belongs the credit of giving our smelting bnsiness a profitable start, and bnt for the efforts of Major McCoy they might never have fonnd their way into the diatrict. So far as the Stata is concerned, it is proper to say that the Oreana Works led the smelting business; and the unassuming Harry Stront, of the Hoosac Works, acquired experience there which he hae turned to good account in this district.

Work on Mining Claims.

Department of the Interior, General Land Office, June 9th, 1874.—The following is an Act of Congresa, approved June 6th, 1874:

An Act to amend the Act entitled "An Act to promote the development of the mining resources of the United States," paeeed May 10th, 1872:

Be it enacted by the Senate and Houee of Repreeentatives of the United States of America in Congress aesembled: That the proviaione of the fifth section of the Act entitled "An Act to promote the development of the mining reaources of the United Statee," passed May 10th, 1872, which requiree expendituree of labor and improvements on claime located prior to the passage of said Act, are hereby eo amended that the time for the firet annual expenditure on claime located prior to the passage of said Act, ehall he extended to the 1et day of January, 1875.

By thie legislation the requirements of the fifth section of the Mining Act of May 10th, 1872, and the Amendatory Act of March 1st, 1873, are changed by extending the time for the firet annual expenditure upon claims located *prior to May* 10th, 1872, to the 1st day of January, 1875.

The requiremente in regard to expenditurea upon claims located *since* May 10th, 1872, are in no way changed by the above Amendatory Act.

S. S. Burdett, Commisaioner.

Tunnels.—There are several tunnel projects talked of in this conty. At present the Milton company's enterprise in that matter seems to be the only one which will be commenced at an early day. We are of opinion, and have been ever since we knew anything about mining, that more drain tnnnels ahonld be run in the mining districta. When they are made, they save expenses in hoisting and pumping. A tunnel jndiciously located in the neighborhood of two or three mines, aoon pays for itself. More tunnels would have been run heretofore had not so much time been required for their construction. An average mining company wants to get to pay dirt aa aoon as they can, and had rather spend much money and make a quick realization, than to take up a few more montbs of time at less cost, in getting to the "pay." But tunneling is now getting to be an enterprise of mere daya, and not of months and years, aa was the case at a very late day of the past. Those psronssion machine drills have bronght about the revolution. They put blasting holes into the rocks with astoniahing rapidity, and they never get tired. The drill which haa had the greateet success in doing such work is the "Burleigh," of which Messrs. Parke and Lacy, of San Francisco, are the agents. That drill does its work not only in tunnels bnt in mines which are worked through shafts. Those at work now in the Idaho mine of this place are proving successful beyond what was expected of them. Those interested in improvementa in mining machinery should exsmine the Burleigh drill. It is a success. —*Grass Valley Union.*

Timber Lands of the Sierras.

The esstern slopes of the Sierras bristls with forssts of timbsr, which have besn cut into at will by pretty much every one who had nse for the timber. Claim was laid to portions of thess lands by the Central Pacific Rsilroad, which the Governmsnt intended to reserve, and its opinion on the mattsr has been made known in the annexed correspondsnce:

Washington, D. C., June 15, 1874.

Hon. John Day, Register State Land Offics, Carson City, Nsv.—Dear Sir: We enclose Commissionsr's letter of the 10th inst., officially notifying ns of the Ssrstary's decision on the appeal taken by the Central Pacific railroad, from the Commissioner's decision of January 15, 1873, rejecting the claim of the road to ths odd nnmbered sections within the limits of the old Timber Ressrve. This decision finally disposss of the claim of ths road, and as soon as we can get new lists made up we will have includsd the selections which have been suspended on that acconnt. Yours trnly,

Britton, Gray & Drummond.

Department of the Interior, General Land Offioe, Washington, D.C. Jnne 10, 1874.

Messrs. Britton & Gray—Gentlemen: As agents of the State of Nsvsda, I have to inform yon that the Hon. Secretary of ths Intsrior, under dste of the 2d inst., affirmed my decision of Jannary 15, 2873, rejecting the claim of the Central Pacific Railroad Company to lands in Townships 18 and 19 N., R. 18 E.. Carson city, Nevada, late Mill and Timber Rsservs. Vsry respectfully, W. W. Curtis.

In alluding to thia correspondence, the *Territorial Enterprise* says:

The reservation lies on both sides of the Truckee river, and was set apart for the purpose of supplying Pyramid Lake Indian Reservation saw-mill with timbsr. Thousands of logs were cut and rolled to the river; hut the mill was not completed, and the logs, instead of being floated down the atream to the reservation, were permitted to rot where they lay. The Government paid for the cutting and banking of about one-half of these logs, and a suit is still before the Court of Claims, we believe, to compel a settlement for the remainder, the amount claimed heing ahout $15,000. The timber reservation ia several thousand acres in extent; bnt it can be of no great value, as the most of the timber has doubtleas heen removed by thia time. It will probably be thrown open to sale by the Government.

The Bloony Mine.—The Bronco mine, located on the San Pedro, where M. B Dnffield was killed, has had a hloody record. It was located in 1855 by a man named Bronco, and in 1858 he and a man named Williams entered into a copartnership to work it. They did considerable work on the mine and as far as developed it showed a large, well defined vein, very rich in silver. They erected bnildings, established a atore and were prspared to work the mine on an extenaive acale, when in 1859 the Mexicans in their employ rose en masse and for pnrpoaes of robbery murdered Bronco, Williams, Marsh and another man whose name we do not know, and carried to Sonora all the movable property. The four victims were buried near the mine, and now Major Dnffield is buried beside them. Since Bronco and party were murdered no work of any importance has been done on the mine, on account of the danger from the Apachee. Major Duffield claimed to have located the mine in 1864 and over a year ago it waa located by other persons and since that location Duffield haa been very violent in his threats towards any and all who dared to interfere with hia righta. Before leaving Tucson on his laat trip we nnderstand he made his will and frequently expressed the determination to drive off whoever he might find on the mine. From the fact of his making his will it is evident that he intended to succeed in his purpose or die in the attempt.—*Arizona Citizen.*

A Giant Enterprise.—A company haa been formed, composed of citizens of this county, for the purpose of bringing lumber from the Sierra Nevadas to this point. A sawmill with a capacity for dressing 30,000 feet of lumber per day, or 50,000 feet every 24 hours, has been established at the head waters of the Fresno river, in what is probably the finest timber region of the State, from which a V-shaped flume is now in process of construction to a point between Borden and Beranda stations—a distance of some 55 miles. There is now engaged on the flume a working force of 35 men, which will be increased as fast as men can be obtained. It ia estimated that 7,000,000 feet of lumber will be nsed in the construction of this flume, at a coat of $1,600 per mile. Merced is to be the principal place of hnsinesa. The enterprise is certainly an important one, and cannot fail to be of immense advantage to the people of thia county.—*Merced Tribune.*

Rich Diggings Steuck.—It is reported that rich diggings have been struck in what is called the "Warren'a meadows." These meadows have long been enpposed to contain vast deposita of gold, hnt it is so deep to the hed-rock that heretofore they have not been able to work them successfully. Above the meadows and a stream that empties into these, very rich mines have been worked for some time, and it has always been believed that this same vein ran through the meadows, hnt heretofore it wae impossible to trace it. But now a rich deposit haa been struck, and men are taking out as good psy as they did in the palmy daya of Warren's camp.—*Walla Walla Union.*

Yield of Pacific Coast Mines.

Ths New York *Times* has the following article on the yisld of the Pscific coast mines:

The war of the Unitsd States with Mexico hss in itsslf heen called a trifling affsir, bnt it is difficult to find any war, sxcepting that of the rebellion, which has had more important rsults. By the terms of ths treaty of psace, California was csded to the United Statss, and being thus opened to American enterpriss, it was not long before the world was startled by the discovery that the new acquisition contained dsposits of gold of almost fabnlous extent. Twenty-five years have now elapsed since that discovsry, and it is almost impossible to measurs the effect which its results have had upon the commsrce and the governmsnts of the world. The businsss of the world increasss year hy ysar with the incrsase of popnlation, and thsre must, of course, be a corresponding increase in the volume of money npon which it is bssed, or there would be not only a gsneral derangement of values, bnt an end of that enterprise by which mankind has bscome civilizsd and prospsrons.

The product of the mines of our Pacific slops in the precious metals is, thsrefore, a mattsr of mors than national importance and interest, for it has affected directly or indirsctly all mankind. Recently-published statistics show that the yield of ths last quartsr of a centnry reached the enormous total of $1,583,644,984. Of thia immense snm California produced thrse-fourths, or $1,094,919,098, nearly all of which was in gold. Nevada has produced $221,402,412 in gold and silver, hut chisfly the latter, for by far ths greater proportion of the prodnct has come out of the wonderful Comstock lodes. Utah, althongh known for many years to be rich in precions metals, hae only lately been made to produce them, and the yield haa been no more than $18,527,537. Montana has added $119,308,147 to the riches of the world, and Idaho has given $57,249,197. Oolorado has been only lately developed aa a mining region, hnt its yield has already reached about $30,000,000. Oregon and Washington Territory have together prodnced $25,504,250. British Columbia haa contribnted abont $9,000,000, and Arizona a small aum, hut the latter Territory haa not been worked to any great extent, and ia capabla of doing mnch better. It is a remarkable fact, worthy of more attention than it has received, that the prodnction of the Pacifio alope has been steadily increasing from year to year. It is especially significant that the increase of last year was about 14 per cent., the actnal yield heing $80,287,436, against $70,236,914 in 1872.

It is interesting to inquire what has become of this immense store of gold and silver. Ahout $40,000,000 of it remains on the Pacific slope in coin and jewelry, and a fraction, of course, haa heen abaorbed by the general business of the country. Bnt the great bulk has been exported, and chiefly to England, China and Japan, bnt moatly to England, which has had nearly $1,100,000,000, leaving only about $500,000,000 for the reat of the world. The reason for this flow of the precious metala to England is given in a recent forcible letter from Dr. Linderman, Director of the United States Mint, to Senator Sargent, of Califorria. The bullion goes there in the first place, not because it is demanded by the commercial needs of the conntry, but because coinage is free at the London Mint, while the United States have always persisted in the absurd policy of pntting a tax npon coinage so onerous that bullion haa heen driven ont of the country, Most of it would go in any event, owing to the fact that we buy so largely in foreign countriea, and it perhapa makea little difference whether it goes as coin or bullion. But if our coinage laws had heen more sensible, there ia reaaon to believe that the proportion against ns would by no means have been so great. There has lately been a manifestation of common sense in Congress on this snbject, and it did not come any too soon.

There is one other fact connected with the yield of precious metala on the Pacific slope which ahould not escape attention. We have said that there has been for aeveral years a steady increaae in the total yield, but it also ahould be said that this is dne wholly to the increase in the production of silver, for there has been a decrease in that of gold. Formerly the yield waa entirely gold, and it waa not nntil 1859, when the argentiferous lodea of Nevada astoniahed the world, that we hsgan to produce silver in any considerable quantities. Thus far the yield has been enormous, but it promises to be mnch larger in the futnre. The Pacific slope, having furnished the world with the gold it required, is now giving it a snfficiency of silver.

Goon Yield.—Nine tons of ore from Highland district were crushed last week at the Floral mill, and yielded something over $1,000. Thia mill, nnder the careful and experienced management of Mr. McMasters, is doing excellent work. In thie lot of ore there was fully 30 per cent. of base metal, yet it was worked np to 80 per cent. of the pnlp aasay, which ia more than ordinary good work.—*Pioche Record.*

Nevada's Bullion Product.—The Carson *Appeal* saya: The hnllion product of Nevada will he doubled within the next twelve-month. Developmenta on the line of the Comstock indicate a large increase, and the enlargement of facilitiee for the transportation of snpplies and productа in the eastern part of the State ensure ns of the fulfillment of our prediction.

SCIENTIFIC PROGRESS.

How a Great Discovery was Made.

M. Claude Collas, a celebrated French chemist, communicates to *Les Mondes* an interesting paper on how discoveries are made. To M. Collas is due the honor of first recognizing nitro-benzol, or, as it is better known, essence of mirbane, a yellowish oil derived from coal tar, having a very sweet taste and an odor strongly resembling that of bitter almonds, which latter peculiarity has led to its extended use in perfumery. In telling the story of how he found this substance, he says that, during the year 1848, he was engaged in researches with a view of utilizing industrially the quantities of light oil which, having no employment, and hence very small value, filled up the cisterne in gas houses. It was at that time worth about one cent a pound. After vainly endeavoring to solve the problem for some time, M. Collas was about to relinquish the task, when it occurred to him to treat the oil in the same manner as gun cotton, that is, with a mixture of monohydrated nitric acid and sulphuric acid. "After the operation, the acids being separated by water," he says, "I was astonished to find at the bottom of my vessel a yellow button. The oil, at first lighter than the water, had become heavier, and hence sunk. I touched it with my finger and rubbed it on my hand, when the strong characteristic odor became at once forcibly apparent. I had found an essence which, at the cheapest, could replace a substance in great demand, and which was worth, instead of five centimes (one cent), fifty francs (ten dollars), a pound."

This discovery of mirbane was, however, only the prelude of the greater one, subsequently made, of the magnificent colors which could be derived from the aniline obtained by its deoxidation by means of nascent hydrogen evolved from iron filings and acetic acid. In 1856 Perkin obtained from aniline the beautiful violet color known as mauve, and since then the dyes thus derived have been produced to such an extent that their value to industry is almost beyond calculation. The little button of mirbane, however, in the modest laboratory of a Parisian apothecary, was the germ from which the whole grand series sprang.

There seems to be a kind of fatality about great discoveries which bring them forth in its own time. Men stumble across valuable ideas, and learn important truths too soon, which lie dead during their lifetime, only to be appreciated by the world after their death. The history of arts and sciences abounds in examples. Faraday, in 1825, found benzol in the tarry residues of gas works, but that illustrious chemist obtained neither fame nor profit for his discovery, which would doubtless have remained buried in the archives of the British Royal Institution until the attention of the scientific and industrial world was drawn to the chemical properties of the substance, almost forty years later. Again, it often happens that discoveries escape those who are, by accident, placed in the very position to seize upon them. M. Collas cites, as evidence of this, the case of a French chemist who, in 1846, made a yellow dye for silk by the action of nitric acid on coal oil. The peculiar odor of the mirbane, which he must have produced, escaped him, and he failed to recognize the new substance which he had obtained.—*Scientific American.*

The Age of Coal.

It seems probable that vegetable matter may, under favorable conditions, be converted into coal much more rapidly than most chemical geologists are in the habit of assuming. At least, a curious instance of an approach toward such conversion within the historic period has been brought before the German Geological Society. In one of the old mines of the Upper Hartz some of the wood originally employed as timbering has become so far altered as to assume most of the characteristics of a new lignite, or brown coal. It appears that certain of the levels in the ancient workings of this mine are filled with refuse matter, consisting chiefly of fragments of clay-slate, more or less saturated with mine water, and containing here and there fragments of the old timbering. This wood, when in the mine, is wet, and of a leathery consistence, but on exposure to the air it rapidly hardens to a solid substance, having most, if not all, the characteristics of a true lignite. It breaks with a well-marked conchoidal fracture, and the parts which are most altered present the black lustrous appearance characteristic of the German "pitch coals." At the same time, chemical examination of the same wood shows that it stands actually nearer to true coal than do some of the younger tertiary lignites. This instance seems, therefore, to prove that pine-wood, when placed under highly favorable conditions, may be converted into a genuine lignite, within a period which, from what we know of the history of mining in Hartz, can not have extended beyond four centuries.—*Athenæum.*

ALBUMEN EXTRACTED FROM MILK.—Schwalbe has found that if oil of mustard be added to cow's milk in the proportion of one drop to 1.1 drams, the milk does not coagulate even after being kept for a considerable period; but that the caseine is transformed into albumen. If this discovery, says *Les Mondes*, is confirmed, it will be of considerable importance in the printed fabric industry.

Man Five Hundred Thousand Years Old.

The New York *Nation* condenses from an English scientific periodical some interesting speculations of Dr. Alfred Russell Wallace, on the probable antiquity of the human species. They may well startle, it says, even those who have long since come to the conclusion that 6,000 years carry us but a small way back to the original home. In fact, in Dr. Wallace's reckoning, 6,000 years are but a day. He reviews the various attempts to determine the antiquity of human remains or works of art, and finds the bronze age in Europe to have been pretty accurately fixed at 3,000 or 4,000 years ago, the stone age, of the Swiss lake dwellings, at 5,000 or 7,000 years, "and an indefinite antsrior period."

The burnt brick found sixty feet deep in the Nile alluvium, indicates an antiquity of 20,000 years; another fragment at seventy-two feet gives 30,000 years. A human skeleton found at a depth of sixteen feet below four hundred buried forests, superimposed upon each other, has been calculated by Dr. Dowler to have an antiquity of 50,000 years. But all these estimates pale before those which Kent's cavern at Torquay legitimates. Here the drip of the stalagmite is the chief factor of our computations, giving us an upper floor which divides the relics of the last two or three thousand years from a deposit full of the bones of extinct mammalia, indicating an Arctic climate.

Names cut in the stalagmite more than two hundred years ago are still legible; in other words, where the stalagmite is twelve feet thick and the drip still very copious, not more than a hundredth of a foot has been deposited in two centuries—a rate of 5 ft. in 100,000 years. Below this, however, we have a thick, much older and more crystalline (i. e. more slowly formed) stalagmite, beneath which again, "in a solid breccia, very different from the cave earth, undoubted works of art have been found." Mr. Wallace assumes only 100,000 years for the upper floors and about 250,000 for the lower, and adds 150,000 for the immediate cave-earth, by which he arrives at the sum of half a million years that have probably elapsed since human workmanship were buried in the lowest depths of Kent's cavern.

TEST FOR ALUM IN FLOUR OR BREAD.—According to *La Science pour Tous*, if a drop of alcoholic extract of logwood be allowed to fall upon pure bread or flour, a spot of yellowish-brown color will be the result. If the flour contain alum in the proportion of one or two per cent., the color is grey, blue, or grayish-violet; if five per cent., the spot is reddish-yellow, with an edge of greyish-blue, such spots of blue being detected in its disc by means of a lens. With 25 per cent., the blue border is no longer visible, but the spots may be discovered. This appears to be given as a recent French discovery, but Dr. Letheby used a decoction of logwood as a test for alum in bread more than 10 years ago. Mr. Crookes, after trying it, decided that it was of no value; but other chemists have commended it highly. Mr. Horsley's process is as follows: He makes a saturated solution of ammonia carbonate, and puts a teaspoonful of it, with the same quantity of the logwood tincture, into a wineglassful of water, in a white ware dish; a slice of bread is put in for five minutes, then removed, and allowed to drain; in an hour or two it turns blue if alum be present.

GUTTA-PERCHA AND VULCANIZED RUBBER.—These are entirely distinct substances. Gutta-percha is the gum of the "*percha*" trees, found in the Malay Peninsular, of which the *Icosandra gutta* is the chief. Vulcanized rubber is the concentrated gum of several kinds of plants and trees rendered hard by the action of heat. It usually has a certain proportion of sulphur compounded with it. Vulcanized rubber is not affected by boiling water. Gutta-percha, on the contrary, softens in boiling water, so that it can be molded into forms which it retains when cold.—*Am. Artisan.*

In a note to the French Academy upon the different conditions under which lead is attacked by water, M. Ad. Bobierre states that he has proved by numerous experiments the law that, with the exception of rain and distilled water, potable waters in general do not attack lead in a sensible manner except when the surface is alternately in contact with water and air. The author believes that a great part of the poisonous material in a plumbiferous water is often held in suspension, and can be removed by proper filtration.

M. DUMAS has communicated to the French Academy some curious experiments of MM. Troost and Hautefeuille, on the hydrates of mercury or combinations of hydrogen with that metal. These combinations, it is said, so strongly resemble those which constitute the amalgams of mercury, with silver and other white metals, that it is hardly possible to doubt that they are themselves amalgams, and hence that hydrogen is a metal, a fact apparently indicated in many other analogies.

THE FROG BAROMETER.—In some countries frogs are used as barometers; the species employed for this purpose is the green tree frog. They are placed in tall glass bottles with little wooden ladders, to the top of which they always climb in fine weather, and descend at the approach of bad weather. This is a cheap and highly interesting weather glass where the green tree frog is to be procured in its natural state.—*Science Gossip.*

MECHANICAL PROGRESS.

Straw Board.

The manufacture of straw board is a growing industry. Notwithstanding it is comparatively modern, its increase has been so great that it has nearly trebled the price of straw during a period of 20 years. Although based upon the same general principles as paper making, it differs from the methods employed for fine papers in several important particulars, some of the processes being omitted and others not required in the latter being necessary.

The first process consists in boiling the straw with quick-lime. This is done in a wooden digester which takes steam from a boiler. The straw is packed in layers with lime between them, and the whole boiled for from 10 to 12 hours, according to circumstances. Straw is composed of a tube of woody fiber and cellular tissue, having upon its outer surface a cuticle composed of silicates of potash and soda, with some free silica. The woody fiber also contains some silica. To the silicious cuticle the straw owes, in great part, its strength. The same cuticle also covers the leaves of the different grains and grasses, and gives them the sharp cutting edge often observed in the coarser varieties.

The boiling process is therefore chemical in its effect. The reaction which takes place is the combination of the lime and the silica, which leaves the straw in a soft and pulpy state. The mass is now ground by a machine similar in principle to that used for grinding the ordinary paper pulp—namely, a revolving cylinder, upon which knives are fixed, which play between a series of fixed knives on a bed-plate. The straw is not chopped by these knives, but is gradually disintegrated until it is reduced to a uniform pulp.

The entire mass is now drawn into a vat, which contains water, and is kept constantly agitated by a series of revolving arms. A wire-gauze cylinder is so adjusted that it will revolve partially beneath the surface of the finid mass. The pulp adheres to the gauze and is carried around to another cylinder, around which an endless belt of felt runs. The latter cylinder presses upon the gauze, and by this means the pulp is made to adhere to the felt, and condensed so as to give it enough consistency to be taken up by another cylinder, called a forming cylinder. The cylinder is one of a pair made of polished metal, and by them the pulp is strongly compressed. The pulp is wound around the former until the proper thickness is reached; this is determined by an indicator. Along the forming cylinder there is a groove planed out, through which the operator now passes a wooden knife, thus severing the soft board; and at the same time he unwinds the sheet and removes it. These sheets are cut so as to form other sizes, and then dried, which completes the process. Woolen rags are sometimes ground and mixed with the straw pulp. This makes a much darker-colored and heavier board, which is worth considerably more than the pure straw board.

The boards as thus manufactured are applicable to a great variety of useful purposes, among which book-binding, button-making and paper-box manufacture are most prominent.—*Furniture Gazette.*

Light Signals.

Much attention has been given to the construction of signal apparatus adapted to giving flashes of light of different colors. In one of the arrangements for this purpose the plan has been to construct lanterns with two internal screens, each capable of being revolved by handles either at the sides or top of the lantern. One of these screens carries glasses, of one or more colors, so that either one or the other colored glass can, by turning the screen, be brought behind the lens of the lantern, and govern the color of the light; the other screen, a "dark screen," can be turned into a position to cut off all passage of light to the lens.

Now, in an improved apparatus for this purpose, just invented in England, there is simply mounted upon the top of a hollow stem, a lantern, fitted, like the above, with two internal screens, but the bottom of the lantern is, at its center, attached to the top of the hollow tubular stem, and, in order to revolve the screens, two concentric tubes, or a tube and a rod, passing up through the stem, are employed. One tube is attached, at its upper end, to the bottom of one of these revolving screens, while the other tube, or the rod, is attached to the bottom of the other revolving screen; and, to the lower end of the tube and of the rod, handles are attached, by which they can be turned, together with the screens carried by them. The bottom of the tubular stem which carries the lantern is fixed to the center of a disk, which at its circumference is attached to a second disk at a short distance from it.

When this signal apparatus is to be used on board ship, the second disk has projecting downward from its center a stem suitable for being dropped into sockets or gimbals; and these may be fixed to the ship on either side, and at the stem and stern—so that the lantern may be set up in whatever position may at any time be most suitable for signaling from.—*Ex.*

DRIFTING upon the shores of the Baltic produced, in 1870, 14 cwt. of amber, value £60,000.

Needles.

So little we believe, is popularly known regarding the history and many elaborate processes necessary to transform a piece of simple wire into the beautiful and highly finished little implement so indispensable to the personal comfort of civilized beings, that we feel no apology is needed to our reader, if we endeavor in this short article to jot down a few interesting items of information respecting the needle, gathered from the *Iron Trade Circular*, London. In the first place there is the wire in hugs coils, which are cut by immense shears. The wire is again cut into the different sizes required, each length being so divided as to make two needles. Several thousands of these lengths are then placed within two rings, about six inches in diameter, made of rough wrought iron, and are then straightened by being rubbed with a hot iron. The wire is next pointed at either end, a beautiful process to witness, innumerable sparks being emitted during the operation caused by the friction of the grindstone and wire, and which resemble a shower of golden fire. Some idea of the rapidity with which this is effected may be formed when it is stated that one man is expected to point 22 packets of 50,000 each in a week. The next process is that of brightening the middle portion of the wire, previously to stamping, that is, roughly shaping the head and eye, without actually perforating the wire. "Eyeing," as it is called, is the next stage, and is done by girls with extraordinary rapidity and accuracy; a smart hand can punch as many as 40,000 in a working day of 10 hours. They are now splitted, which consists in two thin wires being thrust through the eye; this operation is always allotted to boys. The reader must now suppose the needles in "sheets," which have next to be filed, that is, the flange formed by punching the eye is filed off, the sheets are broken in two, now first forming the distinct needle. The heads are now again filed and the needles then rubbed and hardened; next washed and "evened," that is, they are sorted into particular lengths, and are now ready for "tempering," perhaps the most delicate operation of all, and which is always superintended by one of the firm. Picking, straightening, and scouring follow, which latter operation, by the way, comprises about 14 different processes and extends over a fortnight.

Iron Forts.

Fortifications in America have as yet not included iron work as defense against the formidable modern rifled artillery, because it has been deemed almost impossible to make any walls that could not be pierced by any modern projectiles. Yet in England and Germany a great deal of money and ingenuity have been devoted to the work of rendering fortifications impregnable. For six years past experiments have been in progress in Germany that have demonstrated the eyetem of iron defences to be proof against assault. They consist of chilled cast iron gun stands and iron-clad turrets. In Russia and America, the main reliance is upon earthworks. But war has shown that upon a great field any given point may be isolated and starved into surrender like Paris, Vicksburg and Metz, or its importance may be nullified by isolation while the armies work on beyond it. Our own coast defences are nearly all of small value against the artillery now in use. But if they were all constructed as carefully as these new German forts, they could all be evaded by a foreign foe in the manner that Scott adopted at Vera Cruz, and the English and French adopted at Sebastopol; that is, by landing at a safe distance and laying regular seige by land approaches, against which no fort built is proof. It was the maxim of the great Vauban that whatever engineering skill has rendered formidable, engineering skill can overcome.—*North American.*

BACK TO HAND PUDDLING.—The Chattanooga *Times* says: "The Roane Iron Company are preparing to tear down the rest of the Dank's furnaces and put up five more double hand puddling furnaces. The Danks furnaces make good iron, but cost too much for repairs." The iron men of the country have looked with interest toward the operation and result of the Danks furnaces in the various places where they are known to be in use, but especially they have kept watch of the results of the experiment at Chattanooga, for there was the attempt most largely and favorably made with these furnaces. Ten of the new steam puddlers were put to work in the mill named—a rail mill—having been put up and started under the immediate direction of Mr. Danks, the inventor, and his son. One thing is prominently brought out by the experience with the new invention, that, in regard to some new improvements, after the *practicability* of a principle is proved only time will show the *durability* of them. The greater or lesser amount and expensiveness of wear and tear in a change so great as the Danks furnace attempt, is not ascertained by the successful operation of six months or double that time. While it must be confessed as against the method, this action of a company who have given a long trial to it, yet even for the purpose of rail making (especially advocated for this purpose by Mr. Danks) it should not be considered as conclusive. We regret this, because we think the enormous development of the iron trade, and scientific advancement as well, demand something better than the old method.—*American Manufacturer.*

A MAUCH CHUNK man, it is said, has invented a machine to separate slate from coal.

Mining Stocks.

Mining stocks this week have not been very lively, and the list shows a decline from highest prices of last week, as will be seen by refereuce to our stock tahle. The principal topic in stock circles is the Ophir wrangle, which is not yet settled. Curtis, superintendent, refused to give up the mine to Corey, which he was ordered to do, and the matter is before the conrts. The affair is considerahly muddled at present, but will probably be set right by the time of our next issue.

Newe from the mines is generally good. The *Enterprise* givee the following from the Comstock: All of our leading minee are looking so well that prices must eoon improve. Ore and bullion will tell in the long run. The newe from the lower levele of all our ore-producing minee is most cheering, and ehowe that the vein growe stronger ae depth on it ie attained. The indications for the development of a good hody of ore on the 1,900-foot level of the Empire are good. Not only has excellent ore already heen found, hut in cross-cutting upon it a strong hody of water has heen encountered. This promisee a large and permanent body of ore, if we may judge hy what has been seen in the Crown Point mine in openiug out the lower levele. The ore depoeits in the Ophir are improving, and that mine hae again begun to ship bullion. In prospecting the greateet activity ie everywhere eeen, and some valuahle discoveries are sure to he made hy some of the companiee now eo industriously delving upon the great metalliferous range. Several companies are at thie time contending with great bodies of water, hut thie ie far from being a discouraging circumstance; on the oontrary, it is most encouraging, as it shows that they are at the threshold, as it were, of ore-bodies. Some of these may be expected eoon to make important developments.

Variations in price of prominent stocks during the week have heen as follows: Alpha Con., $12 and $13.50; Baltimore Con., $6.50 and $6.87½; Belcher, $80.50 and $85; Best & Belcher, $26 and $27.50; Caledonia, $17.50 and $19.50; California, $36.50 and $38; Chollar, $67.50 and $73.50; Confidence, $10 and $13.-25; Crown Point, $81.75 and $83; Empire Mill, $5.37½ and $7; Exchequer, $40 and $60; Gonld & Curry, $22.25 and $24; Hale & Norcross, $46.50 and $56; Kentnck, $14.87½ and $16.50; Ophir, $16 and $18.50; Overman, $32 and $37; Savage, $79 and $89; Seg. Belcher, $81 and $89; Silver Hill, $6 and $8; Yellow Jacket, $85 50 and $95; Belmont, $4.50 and $5.50; Eureka Con., $18 and $19; K. K. Con., $2.75 and $3.75; Pioche, $7 and $10; Empire (Idaho), $7 and $13.50; Golden Chariot, $12 and $15.

Belcher roee $3 above highest prices last week, and Pioche, $2.75. The declines were more marked: Beet & Belcher, $2; Bullion, $3; Caledonia, $4; California, $2.50; Chollar, $16.50; Crown Point, $2; Exchequer, $20; Gonld & Curry, $4.50; Hale & Norcroes, $3.50; Kentuck, $2; Ophir, $2; Overman, $6.50; Savage, $6; Seg. Belcher, $4; Sierra Nevada, $3; Trench, $3; Union Con., $3.25; Yellow Jacket, $4; Cederberg, $4.50; Raymond & Ely, $1.50.

NEW DISCOOVERY OF PLACERS.—It is reported that rich placer claims have heen etruck near Tehaichipa, Kern county. Information received at Bakerefield etates that fifty cente to one dollar per pan of dirt has been ohtained. The partiee who made the discovery are diligently eearching for the main lead. Quite a number of quartz leads bave been taken up, and work is actively going on.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

THE PERSEVERANCE BLACK SAND MINING CO.—Object: To work the.hlack sand and placers along and near the Pacific Gold Coast, in California and Oregon, and to do a general business of mining. Capital stock, $625,000, in 12,500 shares. Directors: S. A. Morrison, Jarvis Jewitt, Charles E. Hazeltine, H. C. Wilson and Monroe Thompson.

FORBESTWN CONSOLIDATED M. CO.—June 25. Location: Forhestown, Butte county. Directors: Nathaniel Dunhar Plum, Henry E. Vail, John P. Price. Benj. F. Howland, De Witt C. Story. Capital stock, $1,000,000.

SILVER COLUMN M. CO.—June 30. Location: Wallapai district, Mohave county, Arizona. Capital stock, $200,-000, in shares of $100 each. Trustees: J. A. Johnson, H. F. Baker, S. O. Holhrook, Ernest, Michaelmas, J. B. Merriman. President, James A. Johnson; Secretary, Colonel H. F. Baker.

CRESHEN ROCK AND ASPHALTUM PAVING CO.—June 30. Object: Tn manufacture and lay down the Van Camp pavement. Directors: Aaron Van Camp, Henry F. Williams, Samnel W. Holliday, S. S. Tilton and W. W. Stow. Capital stock, $500,000.

ILLINUS CENTRAL M. CO.—June 30. Location: Gwyhee county, Idaho. Directors: Edward B. Pond, Hill Beachy, John T. Boyle, John F, Cassell and R. R. Givens. Capital stock, $300,000.

Meetings and Elections.

MAHOGANY M. CO.—At the annual meeting of the stockholders of the Mahogsny G. and S. M. Co., held on Tuesday, June 23d, the following gentlemen were elected as Trustees: Oeo. M. Pinney, C. H. Bogart, Isham Case, J. E. De la Montagnie and T. B. Shannon, At s subsequent meeting of Trustees the following officers were elected: Oeo. M. Pinney, President; C. H. Bogart, Vice-President, and C. Higgins, Secretary.

THE YANKEE BOY M. CO. has elected J. C. Bates, N. G. Rollins, S. N. Putnam, T. B. Robinson and B. Wells, Trustees. J. C. Bates is President and Treasurer and George Comstock, Secretary.

THE MINERS' PROTECTIVE ASSOCIATION has elected officers as follows: President, H. H. Snhling; Vice-President, H. Sherring; Corresponding Secretary, H. D. Nahor; Treasurer, H. Myers; Sergeant-at-Arms, Wm. Helden.

Important Mining Sale.

Several accounts have appeared in the papers of late, concerning a heavy purchase of mining property by Senator Jones, of Nevada. The *Post* of this city is pretty well informed about Senator Jones, and gives some particulars of the sale. That paper calls the district "Death Valley," but as we nnderstand it the mines are in Psnamint district. The *Post* says:

The new mines are located about 65 miles eontheast of Cerro Gordo, on the western rim of Death valley. They were discovered April 21st, 1873, bnt as they are considerably off the line of travel, have attracted but little attention. The ledges are very large and well defined, and the ore of a high grade, containing hoth gold and silver, the latter predominating. Practical tests show that it will yield from $80 to $150 per ton. Mr. E. P. Rains, an old Nevada miner, was one of the earliest visitors to the district, and being favorably impreesed with its richness, and being aleo the friend of Mr. Jones, reported to that gentleman concerning them, and for the past eight monthe negotiations have been pending. Mr. Rains visited Senator Jonee, in Washington, for consultation on the proposed purchase, and the result was tbat Mr. H. A. Jones, the Senator's brother, returned with Mr. Raine and visited the mines, which proved to be all that they had been represented. The pnrchase was speedily brought to a close, Mr. A. P. Pritchard, of this city, conducting the financial portion of the trade, and the four mines, known ae the Wyoming, Wonder, Chief and Hemlock, together with two sections of land, containing an abundance of timber and several valuable water privileges, have passed into the ownership of Senator Jones, the price paid heing in the neighborhood of $200,000. On one of the properties the second payment was made on the 19th of Jnne, and first payment on the property last mentioned ie to be made in this city on the fifth of July, when Senator Jones will be here.

The developments thue far made in the new district have not been very extensive, but they have been sufficient to show that it is capable of producing large amounte of bullion at very little expenee, the ore paying from the surface. The Wyoming ledge ie opened by a tunnel to a depth of 160 feet, the Wonder to a depth of 30 feet by a shaft, and the Chief abont 14 feet, the ledges all widening as they are followed down. Other mines, owned by Schmidt, D. C. Jacohs and Dr. Weiss, also give great promise, and their ownere are now having a 5-stamp mill bnilt, which will he shipped to the district in about ten days. Senator Jonee will probably pnt np a 20-etamp mill on his property without delay.

The new district ie in Kern county, about 15 or 20 miles from Mesquit City and Dry lake, and can he reached either by way of Loe Angeles or Bakersfield. The distance from Bakersfield ie 155 miles. The explorations and developments thue far made show tbat it contains a great variety of mineral deposits. A toll road has recently been completed into the district, making it comparatively easy of access.

PROSPECTING FOR OIL.—Advices from Los Angelee speak of the organization of a new company to prospect for oil. They have taken up a tract of land within two and one-half milee of the railroad depot at San Fernando, which is said to contain 32 oil springe in sight. The furore for oil has received a powerfnl impetue within in the paet two weeks.

BULLION.—Ninety-six car loads of base bullion, amounting to $1,100,065 pounds, wae ehipped from Palisade, Nev., to San Franoieco and points weet during the month of Jnne.

SHAFT BOARNO.—The Eureka *Sentinel* of Juna 23d says: "Tha boring apparatus, now in nss by the Eurska Consolidated company on the north-esstern slops of Ruby hill, is preparing ths way for a new working shaft. Eight holes, aach about 1¾ inches in diameter, will be put down four hundred fest, aud heing then filled with sand, they will be spoonsd out ths proper depths for ths blasting charges. Four holes are already complsted. There is no cora extracted, tbs drill bsing a solid hit set with sevan diamonds. The reduced rock is removed by water, which, howsver, does not return to the surface aftar seventy feet in depth is reached. The rock is much harder at the point of the hill than at the point where the boring was done last year."

GOOD DIGGINOS.—After running 10 days—most of the time using the water to get their ground into shape—the Sierra Nevada oompany claansd np $10,000 from their hydraulic diggings. Under the circumstances, $1,000 per day is not bad. Now that they have got a face on tbsir bank thsy will begin to gst out some money. The *Enterprise* nnderstsnds that tho Virginia and Gold Hill Watsr Compauy had an eys on these diggings whsn they laid their big iron pipe across Washoe vallsy. It will reqnire many yaars to wash ont the gravel deposit. Millions of dollars will be obtained from it in the shape of gold dust, not to speak of the valno of the float quartz that will be oaught and saved for orushing in mills.

LUCIN DISTRICT.—A correspondent of the *Union* states that a great doal of work has hsen performed, and explorations made, dnring the past six months, with a most happy and encouraging resnlt, showing olearly that there ara othar immense deposits hesides the celebrsted Latham lode. It is anticinated by those wall posted that the Ingot mining company will aoon resnme work again. Why this oompany should leave their immanse smelting establishment and wall-developed minas idle so long, is beyond ths comprehenelon of outsiders.

OANER CANCELED.—The Amador Tunnel and Mining Company and the Newark Silver Mining Company, et als., are defendants to a suit hy F. Franks to recover 1,935 shares of Amsdor atock, and to have a sale of the Amador mine to tbe Newark company declared void. An order was grsnted by Jndge Sharpstein retraining the Newark company from paying $60,000 to the trusteas of the Amador, but this week he set the order asida.

THERE has been a new town laid out near the Rattlasnake mine, in Sonoma conty, cslled "Illinoistown."

A OOMPETENT assayer is wanted in Panamint district, Inyo county.

A 20-stamp mill ia to be pnt up in Panamint district.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

THE MCGLEW FURNACE.—*Chronicle*, June 20: A nnmber of men ars at work at the M. & N. W. mill, sxoavating and grading for the new reduction furnace — McGlew's — which, it is claimed, will greatly advance the mining interest of Alpine by the cheap and close working of our ores. It will be completed in abont four weeks, its erection heing under the snperintendence of Mr. Kelly, agent of the inventor, and who erected one in Mexico, where, it is ssid, it proved a perfect success. One has been erected and is in sucoessful operation, we are told, at Battle Mountain, Nevada.

EXCHEQUER.—We have been sbown by the Manager of this mine some splendid specimens of native silver ore taken from the northmost stope in the north drift from the engine shaft—100-foot level, in the old Bnckeye No. 2 ground. Also, beantifnl specimen of ruby silver ore, taken on Wednesday last from the top of the stope; also, from the face of the main tunnel. Chnnks of ruhy silver ore, weighing from twenty to forty ponnds, are daily taken from the mine.

AMADOR COUNTY.

THE BIG DITCH.—*Ledger*, June 27: Work on the Amsdor canal is progressing finely, and we learn that water will be let in at the npper end in the conrse of a few days.

CALAVERAS COUNTY.

SAN BAUNO POURS FORTH ANOTHER GOLDEN TIDE.—*Chronicle*, June 27: We have intelligence of another rich clean-up at the San Bruno, a mine that is rapidly taking rank among the foremost in the conuty. Seventy tons of ore yielded 121 ounces, worth $2,117.50, an average of $30.25 per ton. Something like $20,000 has been netted by the San Bruno within a month or two, but the source of the golden stream shows no signs of exhaustion. Tbere is no decrease in the eize or richness of the ledge, and the work of development ie pressed steadily forward.

QUAKER CITY.—Work ie progressing with very favorable results at the Quaker City mine, near the Junction. A fair grade of ore is being taken from the level. The ledge is wide and well defined. The shaft is sunk in a slide from the ridge adjoining the mine, and the proprietor has dstermined to hydranlic off ths snrface, to the depth of abont 65 fset, for tha purpose of obtaining a solid fonndation for tha mschinery to be erected. It is expected that tha hydraulicing operation will taka about a month, when everything will be in readiness for commsncing the permanent development of the mine.

MINING JOTS.—Ths mill being put up on the Zacetero mine, at West Point, is nearly completed. Tho frame-work is up and the machinery on the ground. Krim & Co., of Mosquito, will hsva a lot of rich rock resdy for crnshing immediately after the fourth of Jnly.

RIVEA CLAIMS.—Mining operations in the vicinity of Poverty Bar are partially suspended. The famous Story claim, which has hssn psying handsomsly for some time past, has ceased extensiva operations for want of a sufficisnt amount of water. The breaking of the Campo Seco reservoir, a short tima since, has heen ths canso of tha cessation of work.

LIPKEMAN'S olaim, adjoining Story's, is sustaining its rapntation as a paying claim, and worked ensrgetically when watsr can be obtainsd. Ahout a mils bslow the Lipksman claim, on the river, are the Ssnd hill claims. Cliniug & Co., after having bssn actively engaged stripping dnring ths winter, when water was plentifnl, have ceased hydraulicing and began oarting the bottom gravel to a "dump" for washing. The want of fall for slnicing is the great obstacla in working these river claims. The greater part of the hank can be piped away, but the gravel on the ledge must necessarily be oarted out to a plaoe for washing. Meyer's claim is still in operation and holds out creditably. In Mulholland's claim work has been suspended for the season.

COLUSA COUNTY.

NEW MINING DISTRICT.—*Sun*, June 27: According to previous notice, the miners of the cinnabar district north of Snlphur Creek district, met last Tuesday and organized a new district, called Bear Valley District, witb the following boundaries: Beginning at the month of Sulphur creek, thence np Bear creek to the line between townships 15 and 16 (north end of Bear valley); thence west to conuty line; thence southerly, on county line, to Sulphur Creek district; thence easterly with said district to the beginning. The size of each claim is 1,500 faet on a ledge, and 300 feet on each side. All claims mnst be marked ont and recorded in thirty days. This district inclndes the Lovelace discovery and the several extensions thereon.

EL DORADO COUNTY.

GOON QUARTZ.—Mountsin *Democrat*, June 27: Captain Woodwortb, at his mill, on Badford avenue, this city, last week crushed five tons of unselected surfsce rock from the Herrington mine, nesr Gold Springs, and tbe yield fell hit a small fractiou short of $42 per ton. As a matter-of-conrse the owners of the mine are highly elated. The ledge was supposed to be a good one, but the above resnlt more thsn fulfilled the expectations of tbose who were most sanguine as to the solid merits of the mine.

QUICKSILVER.—Amador *Ledger*, June 27: We are pleased to learn that the Amador quicksilver mine in El Dorado county is looking very well indeed. In driving the tunnel into the hill the ore becomes more abundant, and of a high grsde, giving very favorable indications that a large deposit lies further in the hill into which the tunnel is being driven.

LAKE COUNTY.

STAUCK GOON OAE.—*Bee*, June 25: In tbe Pacifio quicksilver mine, an exteusion of the Rattlesnake, near Pine flat, owned by Messrs. Forhes, Parrish, Mackall & Sleeper, of Lakeport, good ore was struck last Saturday, in an open prospecting out.

LASSEN COUNTY.

IRON.—Susanville *Advocate:* It seems strange to ns that somebody does not take hold of the iron mine that lies in the hills soutb of this place. There are millions of tons of ore in sight tbat will assay at least 75 per cent. of iron, and located almost in the valley. Can tbere possibly be a higger thing on the coast in iron? It is located so that from Reno there is a succession of valleys to within half a mile of the lead, and on the edge of the finest belt of timber on thia side of the continent. As this section of the country is now attracting considerable attention, we shall expect before many months to see the mine located and operated by men who are willing and ahle to develop it. We are altogether satisfied that in it there is an enormous fortune, and to acquire it ouly needs an effort on the part of men who have capitsl and are willing to invest it.

MENDOCINO COUNTY.

QUICKSILVER.—*Democrat*, June 27: The discovery of quicksilver leads in the neighborhood of Dry creek, on the road between here and McDonald's, has become rather an old story. Lately we beard a report that John Knight had made a quicksilver discovery heneath his house, and a short time before some parties from ahroad found they had "struck it," and were proceeding to locate claims, when they were suddenly stopped with a notice from John that they and it were on his ranch, his private property. A few days ago all Anderson valley was in a huzz over quicksilver discoveries, and now we have to chronicle a reported sprouting out of a "tin" mine there. We shall not be surprised to see our county, ere long, making a noise in the world on acconnt of her mining interests—to say nothing of coal which she certainly has—in addition to her great lumbering, stock and wool fruitfulness.

NAPA COUNTY.

CALISTOGA SILVER MINE.—*Free Press*, June 27: A large force of miners ars engaged in breasting and stopping the northerly end of the ledge whsre it crosses tha cañon, near Capt. Montgomery's apring. Already a wall of sixty foet of pay ore is sxposed; and within ten days over one hundrsd fest in hight of the ledga will bs exposed, preparatory to working on the starting of the mill. From 400 to 600 tons of ors is now ready for milling, and suffioient in sight to run a twenty-stamp mill one year.

LIVELY TIMES.—The mining dsvelopments in this vicinity are producing good rssnlts in the improvemsnt of the business of this town. Nsw buildiugs are in ths conrse of erection, the stores ars well patronized, and the teams ars pouring into town with wool, grain and flasks of quicksilver, for rsturn loads of machinery and provisions for ths vsrious mining camps. Ths freight trains seldom arrive with less than from tsn to fifteen cars. All appsarances indioate a return of the flush times of '50.

SOMETHING NEW IN QUICKSILVER MINING.—Mr. Geo. Wright, who, until recently, bas bssn engsged in the steamship trade, has recsntly purchsssd from Ross & Co., ths English importing houss, in San Francisco, the Amsricsn quicksilver mine, in Lake county, almost 25 miles from this place, for $100,000, and has commenced the arection of a 10-stamp quartz mill, to crnsh the cinnahsr before submitting it to tha process of retorting. It bas heen oustomary to break the rock to almost the size of a walnut, and then submit it to roasting in a fnrnace or retort; hut Mr. Wright's prooess will rednce it to a powder first. The resnlt of this new process will be looked forward to with great interest. Mr. Wright employs a force of about 20 native Californisns, from the New Almaden mines.

FOR THE AMERICAN MINE.—Two large boilers, re-modeled into quicksilver condensers, are at the railroad depot, awaiting transportation to Geo. Wright's quicksilver mine—the American. Four one-ton rstorts are now en route for the ssme destination.

THE CALISTOGA SILVER MINE.—There are a great many owners in the Calistoga, some of the principal ones being Archy Borland, Coll. Deane, Thos. R. Hsyas, J. W. Winans and Alex. Badlam. The company own a mile esch on two ledges, including the lead known as the Mt. St. Helens G. & S. M. They are putting np a mill, having alresdy the power in sufficient for twenty stsmps, but will only put up for the present two 5-stamp batteries. We are glad to say that Napa has supplied the lumber (60,000 feet) for this work. There are now 1,000 tons of ore out estimated to be worth from $50 to $100 per ton. Several workiug tests of the ore hsve been made, two tons having been taken over to Virginia City, where it yielded $400 a ton, (contsining a laige percentage of gold), and five tons were worked at San Francisco. The ledge extends clear over the mountains, and is claimed to the line of Knight's valley grant. Mr. D. thinks the wealtb of the Calistoga, with its immense ledge and rich rock, perfectly incalcnlable, and that when its batteries are ouce at work it will turn ont ingots of gold and bsrs of silver that shall rival the palmy days of Comstock and the Eherhardt.

THE RISING SUN MINE.—Messrs. F. P. Daubenspeck and A. H. Underwood are the locators and owners of a mine known as the Rising Sun, in Chalk mountain district, adjoining Cinnabar district. The locators, after two and a half months' hard work and 80 feet of tunneling, had their labors rewarded last Friday evening by striking the ledge, and Mr. Daubenspeck passed down to San Francisco Saturday to proonre more tools for the work. The mine known as the Brother Jonathan, owned by B. E. Hunt and others, is an extension of the Rising Sun.

NEVADA COUNTY.

NEW YORK HILL.—*Foot-hill Tidings*, June 27: The Lsrrimer mill has been at work on a run of ore from this mine, and thongb yet too early to get the resnlt of the clean-up, we are told the batch of 50 tons will probahly give an average net yield of $12 to $15 per ton. The upper tunnel is turning out very rich ore this week, a bucket of rock we saw from there yesterday being worth at least $1,000 per ton.

MINING ITEMS.—Grass Valley *Union*, June 30: Slate Ledge mine (Perrin's) is doing a big business. The ledge is good 2½ ft. thick, and turns ont well in free gold and splendid sulphurets. A clean-up of the copper plates was made on Satnrday, after 28 loads of rock had been milled, and the result was about $572 in gold, or over $20 to the losd. The snlphurets saved and the amalgam in the batteries will increase the amount.

New York Hill mine sent up a beautiful little brick, yesterday, which was valned at $2,174, and was milled from 57 loads of rock.

RICH STRIKE IN THE PAYMASTER.—Truckee *Republican*, June 25: We learn from John Hallahan that a rich strike was made in the Paymaster mine, Peavine district, on Tuesday. The main ledge was strnck on that day in the prospecting shaft, at the depth of 150 feet from the surface. The ledge is over 8 ft. thick, and the ore splendid to look at. Stook in the mine, in oonsegnence of this strike, has gone up from $15 to $75 per foot.

PLACER COUNTY.

MINING CLAIMS AT BATH.—Placer *Argus*, June 27: Mining operations at Bath have been active, but the water has fsiled, and hydraulicing is now suspended for the season. The Golden Gate claim, owned by Wheeler & Breece, commenced washing Jan. 10th and continued np to the 1st of June, having only a supply of water half the time. They work 10 men, and ths claim has paid largely. The Rip clsim, owned by Roush & Grinnell, has had water to wash abont four months, during which tims thsy have worksd 12 msn. Their claim has paid hig. Thsy have baen running thsir tailings through the Goldan Gata tunnel, hnt dnring the comming summer thsy will run a tunnel of thair own, 400 ft. in length. Creek claim is ownsd hy S. G. Lewis, and has had a supply of water for hydraulio working for three months. It has richly rsmunerated its owners. Lshigh claim, owned hy Hosmer & Lewis, is in the hsd of Volcano cañon, and takss np tha tailings from the Golden Gate, Rip and Crack claims. Thsy hava worked two msn, and their net profit dnring ths aeason is about $6,000. The Paragon, belonging to Whesler & Breeca, which has hsretofors paid remarkably wsll for drifting, has not bsen worksd during ths psst ssason. It will bs fittsd np dnring the coming season as a hydranlic claim. Roogh Gold is owned by Breece, Davis and othsrs, and labors under tbe disadvantage of not having any front gronnd, tha olaim being in ths shaps of a wedge. As soon as an outlet can bs obtained, it will he fitted np as a hydraulio claim. The New York, Sebastopol and Bsdgar, whsn worked, paid wsll for work done on them many years ago. Of lata years, only sufficient work was done to hold the claims, but as soon as water oan be obtained they will ba fitted up for hydraulicing. Drummond, Bros. & King obtain good pay working a piece of dacomposed quartz, crushing abont a ton a dsy in an arastra. The Haucock quartz ledge, owned by Dewey & Burt, is being rapidly developed. The shaft is down 100 feet, tha ledge being two ft. thick. They have racently put in a pump and waterwheel, and although little has been said about this ledge, it has proved itself to he ona of the best in tbe oounty.

THE MINES NEAR OPHIA.—The Bellsvue is in full blast, turning out high grade ore, showing gold freely. In the stopes of the 240-ft. level tbe ledge is regular and well defined, fully 30 inches thick, and csrries about five per cent. of sulphurets. The ore from this mine is hsing milled at the St. Patrick mill, which has every fscility for tborough working and close conoentration. The plates are wall coated with gold, and a big return is anticipated. More men are advertised for—a good indicstion that ths mines are not played out.

THE work of opening and devaloping ths Orleans mine is progressing steadily, and the prospects are highly sncouraging. Preparations are being madc to erect a mill, and wa shall not be surprised if the new mine adds greatly to the wealth and prosperity of Auhurn.

PLUMAS COUNTY.

MINING NOTES.—*National*, June 27: We saw a couple of slugs, worth abont $50, taken from Lowery & Burge's claim, on Wolf oreek, a few days since. The rook from Batchelder's new mine is paying about $8 per ton. Gregg has commenced crnshing rock from the Grass ledge, in the old mill in Dixie ravine.

SANTA CRUZ COUNTY.

QUICKSILVER DISCOVERY.—*Enterprise*, June 26: There is little doubt but that the Munson mine, lately located back of Corralitos, in this county, will prove most valuable. The indioations are that lsrge deposits of cinnabar are to be fonnd in the region of the newly located claim. The New Almaden mine is just over the mountsin from this new discovery, and why should not the deposits extend through the mountain? Every encouragement should be extended the projectors of the works about to be erected.

SIERRA COUNTY.

LEROE STAUCK.—Mountain *Messenger*, June 27: A prospecting company called the Roman, we understand, working on the mountain across the river from Sierra City, recently struck the ledge they were running for. They found it about 2½ feet wide, and very riob in gold.

OAK RANCH.—Tbe tunnel at Oak Ranch mine is in over 400 feet. They lost sixty feet by tnrning off witb the expectation of "making fat" on an old tunnel, but finding it caved, they went baok and drove their tunnel straight ahead.

RED DOG.—J. K. Code is busily engaged in getting his engine and quartz mill to the site of his ledge, at Red Dog. He expects to have it running in a week or two.

TRINITY COUNTY.

FINDING IT.—*Journal*, June 27: Work is being prosecuted on the lately discovered qnartz lode on the head of Indian oreek, and the ledge promises to be extensive as well as rich. Free gold is visible in nearly every piece of rock taken ont.

MINERSVILLE.—From T. L. Miller we learn that minera in that section are doing well, and that water is yet plenty. Pete Van Matre is cleaning up in his Dutch Guloh claim.

TUOLUMNE COUNTY.

THE TABLE MOUNTAIN BLUE GRAVEL CO.—*Independent*, June 23: The miners are working in the sonth side of the Table Mountain Blue Gravel — the mill is running every day, and they are getting out splendid gravel.

GOON FOR THE ALPHA.—After the expensive outlay of this company in erecting a mill and pntting the claim in shape, we are pleased to learn that a good bed of gravel 3 ft. deep and 30 ft. wide hss recently been developed in the Table Mountain Alpha. From the main gangway one-half day's washing showed a clean-up of 7 onnces. The success of this claim gives additional importsnce to Table Mountain investment.

Lumber Flumes in California.

The Nevada *Transcript* has the following description of a new enterprise in that vicinity: In company with J. E. Brown, one of the originators of the V-flume enterprise, we visited the headquarters of the work the other day. Work is being pushed ahead as rapidly as the circumstances will permit. The mill will be located about three miles above the old Scott's flat saw-mill. Before work could he commenced on it, it was necessary to survey and boild three miles of road on the monntain side east of Deer creek. Most of the road is cut throngh solid bed-rock. The site of the mill is in a very wild and pictureeque spot, and was unapproachable with teams nntil the road was completed. Lumber for a flume half a mile long, for a boarding-house, sbeds and ehop, wae packed in to the place on the backs of men. The timhers for the lower frame of the mill are out and framed, and that part of the frame will be raised this week. Those of the npper frame will be completed next next. This mill will be 120 feet long and 30 wide, with a capacity of eawing 25,000 feet of lumber per day. It will be run by one of Collins' centrifugal turbine wheele. The hydraulic pressure will be 344 feet perpendicnlar. The water will be conducted to the wheel in a 13-inch pipe, about 700 feet long. The supply of timber in the vicinity of the mill is almost inexhanetible. The mill is situated in a very deep cañon, and the ridge, on both sides, is thickly covered with spruce, oak, pine and sugar-pine trees.

There will be a dam above the mill about 70 feet wide and a half mile long, into which the logs and timber will be run down from the hills above by means of slidee. All the timbers for miles above and below the mill will he acceseible to it. Mr. P. D. Shaw, under whose supervision the Bragg and Folsom mill, the mills belonging to the Bank of California, at Carson, were constructed, is the architect. Mr. Collins euperintends the pntting up of the water power. The lnmber and wood cut at the mill will be transported to this city and Grase Valley by means of a V-finme. The survey of the same haa been completed. The grade of the flume will be one inch to the rod. It will be nine miles in length to this city, and eighteen miles to Grass Valley. The amount of lnmber nsed in its conetruction will be 682,600 feet. The length of trestle work will be 11,776 feet. The highest treetle will be 30 feet. The deepest cnt 16 feet. The whole length of cuts will be 4,459 linear feet; 4,424 cubic yards of earth and gravel, 459 cubic yards of medinm rock, and 142 cubic yards of hard rock will have to be removed in its construction. The flume, when completed, will have a capacity of floating from 75,000 to 100,000 feet of lumber per day. The qnality of the timber in the vicinity of the mill is the best in the county. The foreman of the work is Mr. L. M. Snkeforth. The amount of work already done by this company will astonish any one who has not seen it.

Eagle Mine.—The Eagle mine, now the property of the Oakland G. & S. M. Co., bids fair to become the Comstock of Humboldt county. In the old worke the ledge is eight feet wide, and the ore, which can be ehoveled right into a buoket without blasting or picking, assays eighty-fonr dollars in silver and ten dollare in gold to the ton. In the new shaft recently started from the snrface and at present fifty feet deep, the ledge ie over nine feet wide and the ore richer than any ever before found in the mine. Steve Terrill, the foreman, was in town last Sunday with specimens from the new shaft that astonished old prospectors, so rich were they in gold and silver. We are pleased to note these signs of improvement in the Eagle, and hope they may continue, as the success of thie mine will do much towarde disproving the theories and opinions of the so-called experts who visit this neighborhood occasionally, and report unfavorably on mines. Several of these chaps took a look at this same Eagle mine, two years ago, and pronounced it worthless; but recent developments prove that they were very much mistaken.—*Silver State.*

New Conoentrator.—A correspondent of the Salt Lake *Tribune* writes as follows of a new ooncentrator in operation in Bingham: I have been on a vieit with Capt. P. J. Mitchel, the inventor of a new patent for the concentration of ores, for nearly two weeke, watohing the progress of the construction of the works. It affords me great pleaeure to inform you that today the machines are in operation, and are working to the fnllest satisfaction of the inventor, who is an ore dresser of long experience. The process of separating the ore from the gangue or vein matter, ie perfect, and the results of this day's trial will warrant a success. In a few daye we will be able to give yon eome data as to the results obtained. The machinery is simple and comparatively inexpensive, and requiring but little power, so there can be no doubt that this invention will be of great benefit to the mines of the varione mining camps of Utah and elsewhere, where mines are waiting to be made profitable and valuable by ooncentration of ores, with a small outlay for maohinery.

Another Producing Mine.—The Bank of California yesterday received four bars of bullion from the Ophir mine, valued at $10,200. This is the first ehipment of bullion made by the Ophir in eix or seven years. The bars are about one-third gold, and attraot considerable attention. It ie claimed that the mine will now make shipments every week.—*Virginia Chronicle.*

The Black Hill Region.

Who has not heard of the Black Hills and the rich treasures of gold and other precious metals supposed to exist there? Year after year expeditious have been formed or talked of to explore this region, but no reliable information has been obtained concerning it. The expeditions formed have been checked by government interference or driven off by the Indians. Only a month ago, the Bozeman expedition retnrned disorganized and to some extent dieheartened, after a month's continuous fighting with the Indians, reporting barren results.

As the Christian looks forward with hope and faith to that land of pure delight, so the miner looks forward to the Black Hills, a region of fabulous wealth, where the rills repose on beds of gold and the rocks are studded with the precious metal. Nuggets of pnre gold as large as walnuts have been shown and evidence produced as undisputable ae that on which the Christian founds his hope, that they come from this promised land.

And hence it bas come to pass that with the return of every epring-time bold men make their arrangements to explore this region, and the government officials are kept constantly on the alert to prevent it, but the time has now come when the entire army could not, much longer, keep the country from being overrun by the invincible white man—by the hardy pioneer.

To-day there is forming on the banks of the Missouri an expeditiou consisting of from 75 to 100 of as brave boys as ever drew bead on a red-skin, to be led by the redoubtable Chris. Gilson, and sworo to visit the Black Hills and report. They come in squads from Yankton, from Moorhead, from Jamestown—from the east, the far west, and from the south, and early in June they will meet where provision has been made for croesing the river, and with pack-mules loaded with flour, bacon, ammnnition, etc., take up their line of march for the El Dorado of the north.

Who is the brave leader of this band of hardy pioneers? we are asked, and reply, Chris. Gilson, who will live in hietory and song as one of the bravest men of his time. Those spirite who cannot help admiring the valor of Daniel Boone, or the plnck and persistence of Kit Carson will delight to revere the name of Chrie. Gilson. For 28 years Chris. has operated on the western plaine, now a guide or interpreter, then occupying positions of higher trust.

Those who wieh to go with him should apply to him at once at Bismark. There is no fee, but parties joining will need a mule, gun, rations, etc.

About the 15th of June, 10 companies of the 7th Oavalry, under the command of General Custer, two sectione of artillery nnder the command of Lieutenant Chance, accompanied by Lieutonant Colonel Fred. Grant and General Forsythe of General Sheridan's staff, Colonel Ludlow, and several practical miners will leave Fort A. Lincoln for the same region. Their mission is a peaceful one. They go to explore the country, a corps of observation, and will not interfere with the Indians nnless attacked by them. The expedition will not be attended by expense to the Government, ae the men and horeee will require fewer supplies on the maroh than in camp.—*Bismark Tribune.*

Jersey District.—This new district, which has caused such an excitement among miners, is situated about forty miles a little southeast from Unionville. The first, and ae yet the most important discovery of the district, was the result of an accident. The ledge orops out boldly for several hnndred feet on the mountain side, and in appearance differed in no reepect from the adjoining rocks, being covered like those rocks with mosses and lichens. Sheepherdere had camped in its immediate vicinage for two or three years, and had frequently sat ou its prominent croppinge, never euepecting that they contained anything valuable or that the blow of a sledge or pick would reveal the hidden treasure beneath them. From the Austin *Reveille* we learn that Governor McBeth, who ie interested in the principal ledge of the district, had some eamples of the ore recently assayed with the following results: Specimen from the Lander mine, $190.47 in silver; specimen from the Union Flag, $144.64 in silver and 66.45 per cent. in lead. Both claims are supposed to be on the eame ledge, and are in a granite and qnartzite formation. We understand that Gen. Conner, of the Oreana Smelting Works, has made arrangements with the owners of one or both of the mines to smelt a lot of the ore, and as Oreana is the nearest railroad point from the minee, it is probable that all the ore produced will he reduced there.—*Silver State.*

The Mobile and Ohio company has laid in ite yard, in Mobile, 100 yards of a light rail invented by Mr. H. G. Angle, of Chicago. The rail, which weighs 25½ pounde per yard, is rolled nearly in the form of a common angle-iron, and bolted on a stringer of wood, five by six inchee, which is spiked down to the ties, from which the ordinary rails have been removed. Should it atand the severe test to which it ie eubjected in the yard, the company will lay it on all its branch lines. The cost is stated to be about 30 per cent. lees than that of a 50 pound T rail.

The circulation of trade dollars is dsily diminishing in Nevada, owing to the fact of their oeing bought up by the Chinese merchants of San Francisco.

Forestville Chair Factory.

The Petaluma *Argus* of June 26th gives a description of a flourishing industry at Forestville, in Sonoma county:

The machinery of the mill consists of four lathes, three circular-saws, one sash-saw, one boring machiue, one tennoning machine, one mortising machine, and other machiuery, all of which is propelled by a twenty-horse power engine. About fifteen men are employed in the factory, aud an equal number in the woods getting out the material. In manufacturing each man has a separate work, and does nothing else. One man works on posts, one on rungs, another on backs, and others are employed in putting the chairs together, bottomiug and finishing.

The material used in the manufacture of these chaire is ae follows: For posts, mountain live oak; for backs, alder; for rungs, oak. The bottoms are made of rawhide. The hides for the bottoms are first soaked in lime water, to take off the hair, and while yet wet are cut into stripes of the proper length and woven into the bottoms. A young man in the bottoming department, John McAllieter, has become very proficient at thie part of the busiuess, and can bottom 200 ohaire per day. The bottoming process is the last before they pass into the hands of the varnieher, when they are ready for the market. In order to dispose of the chairs a number of peddling wagons are sent out in different parts of the State, and even into Nevada. At the time of our visit to the factory there were eight wagone out peddling, and in this way, and through the furniture dealers, every year's make is very easily disposed of. The factory makes the common sitting chair, large office easy chair, rocking chair, and children's chairs. The enterprise is certainly a laudable one, and we believe a paying investment. The raw material for the manufacture of these chaire is all fonnd within the county, and we are informed by the Superintendent that they even manufactnre their own glue and varnish.

Oregon Mines.—The *Bed-rock* (Baker city O.) *Democrat*, has the following to say of El Dorado district: The mining news from this district is of the most cheering nature. The water is rnnning through the big ditch to the amount of some five hundred to eight hundred inches, which givee the miners there more water than they have had in years past, and they are making good nse of it by running hydraulios to good advantage. There are now some nine or ten hydranlica rnnning, with a prospect of some three or four more being put in operation. The claime where these hydraulics are running have been heretofore prospected with good resnlts. With the water now enplied to the miners, we expect to hear of good olean-npe in El Dorado, or Shasta, mining district. We hope the anticipation of our mining friends there may be fully realized. We understand that it is the intention of Mesere. Packwood & Carter, who now have control of the ditch, to extend it eome six or eight miles, eo as to tap both branchee of Burnt river, and that by so doing they will he able to procure water sufficient to run the full oapacity of the ditch, whlch is calculated to be some two thone-and or twenty-five hundred inches. When this ie done this ditch will be one of the best paying properties in Oregon, and Shasta district will give an account of herself that will place her in the foremost rank of mining camps east of the Cascades.

Tybo District.—A correspondent of the Belmont *Courier* writes ae follows from Tybo District: There are now about 100 men in camp, and all seem to be at work either for themselves or for the 2 G Mining Company. Thie oompany is working about 50 men—20 on the mines and the balance on outeide work—erecting buildings, euch as boarding honse, store honse, aesay office and snperintendent'e office. A ditch has been cnt for carrying water pipe, one and a half miles in length. A railroad for running ore to furnace, a distance of about 200 yards, is about completed. Machinery ie on the ground for a 40-ton furnace; fire rock and brick are also on the ground; grading for furnace ie done; coal is being burned. All of which has and is being done under the guidance of Cyrus Packard, an able and efficient manager. Mr. McGee, the general manager, will attend to mattere in person the present month. A greater force will be put on the mines, and then quantities of ore will be added to the now large dumps.

At Gold Monntain, says the *Reveille*, Mr. Higgs has put a force of men at work on the Crown Point, Lottery, and others of the eeries of mines owned by hie company. R. Ross sunk a well 26 feet in depth, at which he etruck a etream of water which flowe in at the rate of 120 gallons per hour. Gen. Page has made arrangements to seonre thie water, and will run in a cut and tnnnel a length of 300 feet, and if the water should prove to be suffioient in quantity, he will move the mill to Gold Mountain and inorease its capacity to 10 etamps.

Mottling of Marble.—The reaeon why the mottling of marble can not be imitated upon paper, wood and other substances of like character, is that marble ie a translucent material. Therefore, not only the mottling which ie upon the surface is visible to the eye, but that which is below the surface is also partially visible, producing a delicate, softly-shaded effect, which is imposeible upon opaque snbatancee. Upon some kinds of stone this mottling may be imitated almost exactly.

Oil Deposits of Ventura.

A letter to the San José *Mercury* gives the following acoount of the oil wells of Ventura county:

The oil deposits of Ventura county are inexhaustible, and when developed to anything approximating their full extent will constitute one of her chief sources of wealth. In the year 1865 a company was organized for their development by Tom Scott and other Eastern capitaliete, and operations were at once commenced, bnt owing to the many difficulties which they experienced in the prosecution of their work they were not very successful. On the formation of the company they purchased Spanish grants, aggregating 250,000 acres, a portion of which were sold to raise means to defray the expenses of work. The purchases of the company included the Colonia, Ojai, Simi, Las Posas, Cañada Larga, San Franoisquito and Caligua grants. Their first work was on the Ojai, south of Sulphur mountain, where they obtained a flowing well at a depth of 600 feet. At first it produced about 25 barrels per day, bnt work being discontinued the flow became obstructed, and it now produces only eight or ten barrele per day. In the cañons and ravines tributary to the Santa Clara valley, and which lie in the vicinity of Solphur mountain, there are several other works, some of which are producing an excellent quality of oil. The Hayward works produce about ten barrele per day of 32 gravity oil. The Stanford produoes six barrele per day, the San Paula ten barrels, and the San Fernando, near Camulos, abont ten barrels. These productions are all from natnral flows and horizontal tunnels. At the last named works an oil refinery has been established, which promises to he a euccess. The oil at these works, however, ia of an inferior quality, being quite heavy. At present there is bnt little demand for the oil, and the ehipments now do not exceed 200 barrels per month. This amount is shipped by R. G. Surdam, who furnishes it to the Central Pacific Railroad Co. for lnbricating purposes. There beiug no sale for the oil all operations have been suspended, and immense qnantities of it now run from the tanke down the mountain sidee, forming great pools in the gulches below. The source of all this oil ie supposed to be in Sulphur mountain, whioh derives its name from the snlphur springs in the vicinity. It ie found in a stratum of shale and in localities easy of aocese. With a reasonable expenditure the varione oil works of the oonnty conld be made to produce almost any desired quantity, which we doubt not will be done ae soon as the demand will warrant. The oil oan be delivered at the wharf for one dollar per barrel. A ooneiderable amount of asphaltum is aleo found in the oil regions. With the development of the oil resources, the hnsiness of San Buenaventura will receive a new impetne.

Succeseful Smelting.—The Truckee *Republican* says: The Tecoma Smelting Works here are now under the management of practical, experienced men, and we eee no reason why they should not be carried on succesfnlly. The furnace wae first started up on Saturday last. Up to yeeterday morning the bullion product was 20,000 pounde. This was ehipped to the refining works at Omaha yesterday. Only one of the two furnaces is in operation. Thie one rednces about twenty tone of ore daily, prodncing nearly 10,000 ponnds of crude bullion. The ore used is from the Company'e mines at Tecoma, eave a emall amount of outside ores which have been obtained for fluxing purposes. The company expect to ship another car load of bullion (20,000 pounds) tomorrow. The single furnace consumes daily about 600 bushels of charcoal. Furnace No. 2 is in readiness, but will not be etarted up until more ore is secured. No difficnlty ie experienced in smelting the ore, the great trouble being to get enough of it to keep the furnaces busy. One of the drawbacks the Superintendent of the worke here has had to contend with, is the lack of material for making varioue repaire. When a break or acoident occurs, it is important that the necessary means shonld be at hand to remedy the disaster as promptly as poseible. Thie difficulty will donbtless be remedied soon. We understand that the company are willing to purchase orea from any one, which may contain a high percentage of lead.

Insects and Flowers.—According to Dr. Muller, of Lippstadt, who has recently published an exhauetive treatiee on the fertilization of flowers by insects, it appeara that insects are not impelled by their instinct to frequent particular species of plants. This may oconr, but it ie only in isolated casee, of which he ia able to cite only two. In general, insecte roam at random over the fielde, and light indifferently on any flowere that attract their attention, and it ie not uncommon to find them making fruitless search in flowere that contain no honey. This important fact has been generally overlooked by former observers.

Truckee Bullion.—One oar of bullion (20,000 pounds) was shipped from the emelting worke for Omaha yesterday and another will be dispatched to-morrow. Thie will make the fourth car load shipped within about ten daye—80,000 pounds in all. This is certainly an excellent beginning and angure good resulte for the near future.—*Republican.*

Ground will be broken on July 4th for the constrnction of the Visalia railroad. It ie expected that the road will be completed by the 15th of Angust.

Useful Information.

Preservation of Metallic Surfaces.

The great tendency of sheet iron to decay by oxidation has led to the employment of many methods of preventing it. The first and most natural seems to be a coating of some substance, and paint or oleaginous varnish has been much used. This is often employed where the exposure of the natural color of the iron is of no account, or where there is no desire to conceal the material of which the work to be preserved is made.

Asphaltum and black varnish are largely employed in many places, and a surface thus protected is susceptible of being gilded and elaborately finished, after the manner of tea trays, waiters, coffee cans, etc. Coating the sheet metal by immersion in a bath of melted tin is adopted, and is the most common, and perhaps the best, protection sheet iron can have. A familiar illustration is the numerous articles of household use that are so very common.

There is a process called galvanizing (but the term is not properly applied, as the process is not completed by the galvanic current), and this is very extensively used now. It consists in coating the iron by immersion in melted zinc, as in coating with tin. Articles of cast or malleable iron that are exposed to damp, or are for use under water, are coated in this way with advantage. Specimens of this method may be seen in the iron fixtures of washing machines, churns, wringing machines, etc.

There is also a process of enameling, in which the article is dipped into a gummy fluid, and the gloss or enamel, reduced by pulverization or grinding to a powder, is dusted on the gummy surface, where it adheres. The article is then put into a muffle and placed in a furnace, where, after a short exposure to a certain heat, fusion takes place, and a uniform coating is obtained, which is a good protection to such articles as breadpans, saucepans, etc. Enameled kettles and saucepans used by the housewife for boiling or cooking acid fruits are made in this way; and the application of such a coating should be more generally adopted.

To coat the sheets of iron with either tin, zinc or enamel, it is first immersed in sulphuric or muriatic acid for a sufficient time to clean them of grease or oxide; after that they are washed clean, and again dipped into a solution of muriate of zinc, and finally placed in a bath of tin or zinc, a thin coating of which immediately adheres to the surface.

By means of the electro-deposit process sheet metal may be coated with gold, silver or copper; but this process is used most for articles of ornament, and is intended to hide the metal of which they are formed. As the process is quite cheap, when but a light coating of the metal is required, it is extensively used, sheet brass or soft metal being chiefly selected for this purpose.—*Iron Age.*

Iron Architecture.—The use of iron as a building material has of late years been largely increased, especially in works of magnitude and importance, in consequence of the very great facility with which it can be manufactured into almost any required form, and the almost unlimited strength it possesses, if judiciously treated and applied. Yet, notwithstanding the enormous amount of iron construction that architects see constantly employed in all directions by engineers, it would appear that very few of them deem it worth while to learn anything about its capabilities and qualities as a building material. Architects do occasionally use iron in columns and girders, but they make but little effort to extend its use so that it might take the place of the materials which have been used from time immemorial, and with which they are more familiar, as brick, stone or wood. Hence it is that whenever any large building is erected, the whole credit of the design and execution is carried off by an engineer; although, perhaps, an architect may be called in to assist in the decorative features. And this state of things will continue to be so as long as architects are contented to take their knowledge of iron-construction at second-hand from the engineers. It is, however, a matter for serious consideration whether the architectural profession should be satisfied with simply endeavoring to imitate the styles and modes of building employed in former ages, rather than attempt to keep up with the rapid advance of the present age, and meet its requirements by adopting the use of a material of which our ancestors had but very limited knowledge.—*Builder.*

Nozzle for Delivering Water.—In a recent lecture on "Liquids," at the Royal Institution, Professor Tyndall mentioned that he had learned from Shaw, the head of the London Fire Department, that a scratch in the nozzle of a fire-engine delivery pipe, which an ordinary workman might overlook, will reduce its throwing power from 300 feet down to 150 feet. Our hydraulic miners in this State have frequently noticed strange and unaccountable variations in the force of the stream while the water remained constant; but we think that a falling off of one-half, resulting from an overlooked scratch, is rather heavy.

Type metal is composed of lead with ¼ or ⅛ of its weight of antimony, or: lead 2 parts, tin 1 part, antimony 1 part, or: lead 15 parts, tin 1 part, antimony, 4 parts.

Testing Iron Ores.

Mr. Thomas T. Morrell, Chemist of the Cambria iron works, at Johnstown, Pa., communicates the following to the *American Chemist:*

Persons selecting iron ores for the furnace may be glad to be reminded that the quantity of iron can be approximately estimated by easy colorimetric methods. For this purpose the deep colored solution of iodine, produced by reducing perchloride of iron by iodide of potassium (as in a well-known volumetric method,) seems most likely to give uniform results.

Dissolve 0·100 grammes or more of the ore in hydrochloride acid, and filter into a test tube. If much free acid is present, nearly neutralize with potassa; if protochloride of iron, oxidize with permanganate of potassa, and heat till the pink color disappears. Add now some crystals of iodide of potassium, immediately close the tube, heat till the reaction is complete, and compare, when cold, in a rack of standard colors (Britton's colorometer), or with stripes or tubes of glass of the same tint.

It is best to use about the same quantity of iodide in each trial, and to standardize each tube of the colorometer by tests with different quantities of a solution of perchloride of iron.

Small quantities of the chloride of lime, magnesia, manganese and alumina do not affect the results.

With care the results should agree to within one per cent. The addition of any other substance to intensify the color of the iodine solution is unnecessary, and would require the use of too small a quantity of ore.

Cleaning Brass.—A correspondent writes: The following is a recipe I have successfully tried in cleaning brass and copper: I make a mixture of one part of common nitric acid and one-half part sulphuric acid in a stone jar; then I place ready a pail of fresh water and a box of sawdust. I dip the articles to be cleaned in the acid, then remove them into the water, after which I rub them with sawdust. This immediately changes them to a brilliant color. If the brass is greasy, it must be first dipped in a strong solution of potash and soda in warm water. This cuts the grease so that the acid has the power to act. This is a Government recipe used in the arsenals. We will add to the above recipe that first washing in clean water, and second in water in which aqua ammonia has been placed to neutralize all trace of the remaining acid upon the surface of the brass, is an improvement upon the above process, which is, in all other respects, a good one. After dipping in the ammonia water and cleaning in the sawdust, if a good quality of lacquer be used, the effect is very fine. This process is excellent in preparing brass labels stamped from thin sheets.—*Artizan.*

Joining Gas Pipes.—At a recent meeting of German engineers a new method of joining gas pipes was described, which may interest some of our readers: Instead of the usual projecting end, the pipes have creases or channels around them. When placed in contact, end to end, a strip of soft lead is bound about them, and pressed tightly against the pipes by a wrought iron ring. The advantages claimed are that the pipes are lighter and more easily cast; less lead is required to make the joint tight; no heat is required for applying it; it is quickly done; and especially that the joint is somewhat elastic, and will last longer in soft ground, or when heavily loaded.

Vulcanized rubber coated iron tubes are now manufactured in Philadelphia, which will bear over 300 degrees heat, the rubber being prepared at 400 degrees Fahrenheit. The pipes can therefore be used for either hot or cold water. Gas and water are said to have no effect on them, and the coating resists sulphuric and muriatic acids and caustic potash solution.

Transferring Pictures to Glass.—Coat the glass with a varnish of balsam of fir in turpentine, then press the engraving on smoothly and evenly, being careful to remove all air bubbles. Let it stand for 24 hours, then dampen the back sufficiently to allow the paper to be rubbed off by the forefinger, rubbing it till a mere film is left on the glass, then varnish again.

Two recipes are given in the *Scientific American* for removing tallow and white lead which have been applied to polished parts of machinery to prevent rust: 1. Use turpentine, and rub it in well. 2. Try a concentrated solution of caustic potash, scrubbing with an old scrubbing brush.

To Cut Glass Jars.—Fill the jar with lard oil to where you want to cut the jar; then heat an iron rod or bar to red heat, immerse in the oil; the unequal expansion will check the jar all round at the surface of the oil, and you can lift off the top part.

To remove tattoo marks from the skin, blister the part with a plaster a little larger than the mark; then keep the place open for a week with an ointment; finally, dress it to get well. As the new skin grows the tattoo marks will disappear.

Wood can be ornamented by punching down carefully in patterns, planing off a little, and then wetting; the parts punched down show in relief above the planed surface and make quite a puzzle.

Good Health.

The Human Frame.

No 4.—The Stomach.

This important organ is a muscular sack, formed by a dilatation of the alimentary canal. In shape, it somewhat resembles a curved section of a cone; in size, it varies from eight to 12 inches in width, and from three to four in its greatest diameter. It is usually estimated to contain about one quart when in a perfectly normal condition; but so universally are excesses committed in eating and drinking, that, in scores of observations, we do not remember to have seen a single one that had not been dilated beyond this capacity. Its situation varies considerably, according as it is distended with food, or otherwise; its proper position is just below the last organ described—the liver. It is of a purely carniverous type; being intended only for the dissolving or chymifaction of the food which has been finely triturated by the teeth. It furnishes by far the most important of the five solvents concerned in digestion—the gastric juice. It actually digests, or reduces to chyme, all the elements of the food except the non-nitrogenous and hydro-carbons, or sugar, starch and oil. Of these, sugar and starch are digested by the duodenal juices; oils, by the pancreatic fluid.

Of its physiological functions we know much; the celebrated Martin case, wherein a permanent fistula or opening, followed a terrible gun-shot wound, having afforded wonderful facilities for studying its functions, and given a great impetus to the investigation of all the details of alimentation. Many important facts have been thus obtained; some physiologists even going so far as to lay down laws for the exact time in which any given article of food would be digested, and, consequently, classifying all such as wholesome or unwholesome according as they seemed to resist the action of the digestive powers of the stomach, or otherwise. By such rules pigs' feet and tripe were laid down as being digested in an hour; trout, in one and a half hours; milk, in two hours; roast beef, in three; and so on, until the climax was reached with roast pork and boiled cabbage, which, they said, required five and one-half hours for their proper digestion. But, from close observation, it is our belief that stomachs have as many whims and idiosyncrasies as have their masters, and that which is easily digested by one is "poison" to another. Hence, the folly of any set of rules which prescribe just what all persons shall eat. Each person should know enough of his own temperament and physiological organization to be able to select those articles of food which are best adapted to his own individual wants.

Treated from this common sense stand-point, many of the fearfully numerous diseases of the digestive organs would cease to exist. But we go on, defying or ignoring Nature's laws; eating, in half the time required for perfect mastication, double the amount necessary for our sustenance; jumping up and going at hard brain work, immediately after each meal when we ought to take complete mental relaxation for some time, in order that our nerve forces may be properly concentrated upon the digestion of our food; drugging ourselves with stimulants, when we see our digestive powers are beginning to fail, until the inevitable result follows and we become confirmed dyspeptics. We then pounce upon the stomach as the unlucky source of all our evils, forgetting that a large percentage of our food was never intended to be digested by it; forgetting that Nature has given us organs of locomotion, demanding that they be exercised; free, pure air, requiring it to be breathed; proper hours for repose, and insisting on their being so occupied.

Indigestion may also be intestinal, and aggravated by the use of sugar or starchy substances; or it may be pancreatic, and increased by the improper use of oils; or it may be due to a torpid liver, or deficient nerve energy, and rendered doubly worse by sedentary habits. Treat your stomach as becomes a rational being; live in accordance with the laws of nature, taking due exercise, pure air, good food that is suited to your own peculiar organization, and above all, allow yourself plenty of cheerful, mirth-provoking relaxation, and it will be impossible for you to suffer from indigestion.

Exercise.—The various kinds of physical exercise are considered by Dr. Bowditch in some detail. Walking, he believes, is the best form, and most generally applicable. It exercises the body better than any other method. The most favorable time is about midday in winter and in the morning and toward evening in summer. Late in the evening is less useful because of the liability to dampness and coldness in the absence of the sun's rays. Fast running, in the opinion of the writer, is pernicious to consumptives; it produces violent motions of the heart and too rapid breathing, and consequently great tendency of blood to the lungs. As regards dancing, it is said that, at appropriate hours and for a proper length of time, nothing can be better. It promotes grace and ease of motion and positive health, if used thus properly. Horseback exercise for consumptives is excellent, and in fact a remedy for the disease at its inception. An easy pacing or galloping horse is better than a hard, square, solid trotter, as the latter is apt to cause pains in the chest and undue fatigue.

Hygienic Hints.

It is possible that the stature of all persons may be increased if the conditions of health are enforced during infancy and childhood, and until the age of puberty is reached. Exercise in the open air, and the kinds of food which produce the carbonate and phosphates, which are found in milk and in the husks of grain, are highly conducive to osseous development.

But few people attach due importance to the use of the kind of diet which contains the elements that contribute to the formation of bone.

The constituents of bone are carbonate and phosphate of lime, and one-third the weight of the bone organic matter, therefore we should freely use oatmeal, Graham flour, beans, etc. In some localities the water is impregnated with lime, owing to the under-stratum of limestone that exists there, and it contains mineral properties sufficient, if used for domestic purposes, to increase the development of bone and muscle. Children should have all the milk they can drink. If it is first diluted with water, hot or cold, the proportion should be one tablespoonful of water, or a piece of ice, in a pint of milk. Sometimes milk disagrees with the stomach and forms curds. This tendency is entirely obviated by the admixture of water.

Children are more often fed too little than too much; too often their food is not sufficiently strong or nutritious. Cakes and candies should never be given to children until they have first eaten of wholesome food; they should have all they want of every kind of farinaceous food, and should also be allowed the judicious use of all other kinds, else some part of the system may be deprived of some important element of nutrition. They should not be permitted to remain long on the wet, damp ground, although their feet may be protected with overshoes. There are many days during the year when it is better for them to play on the porches that are most exposed to the sun. Dwelling-houses should have porches on all sides, so that children can have a preference on which to play, according to the weather. If they are sick give them no food or medicines except fruits, canned or otherwise, and air as pure as that which is unconfined, though they should not be exposed in a current of air. If there is a fever lemonade should be drank freely, and iced milk if it is desired. Whatever articles of food the appetite has a longing for may be judiciously given. Very fortunate are those children who live in healthful localities and have all the milk they can drink from healthy cows that are properly fed; and they are certain to enjoy robust health and develop strong osseous frames if they exercise freely in the open air and sleep early and as long as they wish to, especially if assisted by the under-stratum of limestone found in some localities. Even if there is a predisposition to hereditary disease, these healthful influences will prove great preventives. Although the importance of food cannot be over-estimated, yet heat and light are threefold more important. More nutriment is furnished by the atmosphere than is found in any kind of food. It must be pure, or we are deprived of the vital means of life and sustenance; and the solar rays bring to our brains and bodies the very essence of life.—*Herald of Health.*

Modern Surgery.—Life is not only saved or prolonged in thousands of instances every year through the agency of modern surgical skill, but how much more tolerable and happy it has been rendered by the wonderful progress made in this branch of science. If misfortune overtakes us and we are brought under the surgeon's knife, it is only necessary to inhale the vapor of a few ounces of ether or chloroform, and we become oblivious to all suffering. Consciousness returns only to awaken joy that the duties of the surgeon are ended. Surgical instruments and appliances are marvelous examples of artistic skill and ingenious invention. What with the opthalmoscopes, stethoscopes, spectroscopes, curious mirrors, etc., the human body in most of its parts is brought quite within the field of vision, so that dark cavities and deeply-hidden organs are illuminated and forced to reveal to the eye the nature of morbid conditions. The future for scientific surgery, and also for medicine and chemistry, is full of promise. One difficulty after another will be surmounted in the years to come, and perhaps there will remain ultimately but one great physical catastrophe which cannot be overcome by human skill, and that is death.—*Boston Journal of Chemistry.*

Drinking Water and Zinc.—In a communication to the Royal Society of Edinburgh, James R. Napier called attention to the fact that zinc from galvanized iron goods dissolved very rapidly in Loch Katrine water. He exhibited water of a milky color, made so by immersing 2½ lb. of galvanized iron nails and other objects for about 30 hours. He also showed pieces of a kitchen boiler, which had been coated by the so-called galvanizing process, in which, after 12 months' use, the zinc coating had entirely disappeared, and the iron itself was greatly corroded.

Barley Water.—*The Druggist* gives the following: Take of pearl barley, two ounces; boiling water, two quarts; before adding the boiling water, let the barley be well washed. Then boil it to one-half, and strain the liquor. A little lemon juice and sugar may be added if desirable. To be taken *ad libitum* in inflammatory diseases.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.

San Francisco:

Saturday Morning, July 4, 1874.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Straw-Burning Engines; Tullock's Automatic Ore Feeder; Our Holiday, 1. Our New Volume; Quicksilver; Academy of Sciences; Mint Statistics; Mechanics' Fair, 3. Blatchly's Compound Engine and Boiler; Work Done by Burleigh Drill; Aaron's Amalgamation Process; Lower Rates of Interest, 9. Patents and Inventions, 12.

ILLUSTRATIONS. — Tullock's Automatic Ore Feeder, 1. Blatchly's Compound Engine and Boiler, 9.

SCIENTIFIC PROGRESS.—How a Great Discovery was Made; The Age of Coal: Albumen Extracted from Milk; Man Five Hundred Thousand Years Old; Test for Alum in Flour or Bread; Gutta-Percha and Vulcanized Rubber; The Frog Barometer, 3.

MECHANICAL PROGRESS. — Straw Board; Light Signals; Needles; Iron Forts; Back to Hand Puddling, 3.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 4.

MINING SUMMARY from various counties in California, 4-5.

USEFUL INFORMATION. — Preservation of Metallic Surfaces; Iron Architecture; Nozzle for Delivering Water; Testing Iron Ores; Cleaning Brass; Joining Gas Pipes; Transferring Pictures to Glass; To Cut Glass Jars, 7.

GOOD HEALTH.—The Human Frame; Exercise; Hygienic Hints; Modern Surgery; Drinking Water and Zinc; Barley Water, 7.

MISCELLANEOUS. — Montana Placer Mining; The Pioneer Smelters of Eureka; Work on Mining Claims; Tunnels; Timber Lands of the Sierras; The Bloody Mine; A Giant Mine; Rich Diggings Struck; Yield of Pacific Coast Mines; Good Yield; Nevada's Bullion Product, 2. Lumber Finmes in California; Eagle Mine; New Concentrator; Another Producing Mine; The Black Hill Region; Jersey District; Forestville Chair Factory; Oregon Mines; Tyho District; Mottling of Marble; Oil Deposits of Ventura; Successful Smelting; Insects and Flowers; Truckee Bullion, 6. Pioche Mines; Mexican Mines; The Livermore Coal Mine; Santa Rosa Branch N. P. R. R.; Cassiar Mines; The Yakima Mines; Indian Creek Gravel Mines; Emma Mine; The Use of Paper; Lung Power; Alpine County Mines; Battle Mountain, 10. Amendment of the New Code Incorporation Assessment Law of California, 12.

Removal.

July 18th, 1874, the business office of this Journal will be removed just one block east of our present location, to No. 224 Sansome Street, southeast corner of California, over the Bank of British Columbia, where we have secured large and elegant quarters. This removal is made in consequence of the sale of the building in which we are now located, to parties who will proceed immediately to demolish the present structure, and erect a new and magnificent block in its place.

Our New Volume.

In pursuance of a time honored custom in the newspaper world, we call the attention of our readers to the fact of our having conoluded a volume and, with this issue, commenced another. The MINING AND SCIENTIFIC PRESS has completed its sixteenth year, and with this number takes its first step in the seventeenth. We do not desire to call to the minds of our readers what we have accomplished in the special field in which we labor, but will let our own pages speak for themselves. We shall continue to endeavor to make the paper as interesting as possible for the class of readers among which it circulates, and gather all suitable information; preserving it in a condensed form, so as to make each issue contain a variety of matter. The editorial pages are now set "solid" as well as the "reprint" pages, so as to economise space; this arrangement, although increasing the editorial labor, gives room for much more reading matter.

We again extend the fraternal grasp to our numerous and valued exchanges. They will please accept our hearty thanks for their complimenta and general courtesy. It is our wish and intention to retain in full our list of exchanges as long as it is.

Our patrons have our sincere thanks for thei substantial support, for friendly encouragement, and for innumerable courtesies.

Quicksilver.

In a recent issue we published the following item:

"They talk about having discovered a 'ledge' of cinnabar in Camp Floyd District, Utah, which assays from 20 to 75 per cent. in quicksilver. Utah does not want California to be ahead of her in mining matters; but 75 per cent. cinnabar even beats this State, and, in fact, almost any country in the world. Perhaps, if we discount 70 per cent., the report may be true; but even that is perhaps doubtful. Utah assays are generally pretty heavy ones."

Shortly after this was published, we received a box of samples of this ore. In the box was a smaller one, in which was a clipping from the PRESS, containing the above item, a small quantity of very rich ore, and this legend on a scrap of paper: "How is this sample for 75 per cent.?" We must acknowledge to being very much surprised, for the sample sent us was the purest vermilion. We have shown it to a number of persons interested in quicksilver, and they all pronounce it to be as rich as anything they had ever seen. A few hundred tons of it would make any man's fortune. The ore sent with it was excellent, but of course not so rich as that in the smaller box. The mine from which these samples came is called the "Geyser." It is in Camp Floyd District, Utah. The owners are L. Cuddeback, B. F. Shaw, J. G. Lockridge and J. G. Hughes. Of course it is not to be supposed that the deposit is all as rich as the samples sent us; but we must acknowledge that they are exceedingly rich. The owners vouchsafe us no information as to what they are doing with the mine; but it is to be supposed that, with present high prices of quicksilver, they will not let a mine be idle that turns out such ore as it does, even if in small quantities. The composition of cinnabar is given by different authorities, in Dana's Mineralogy, as containing from 69.36 quicksilver, 11.38 sulphur, to 86.79 quicksilver and 13.67 sulphur. The lowest is that taken from the Almaden mine, in this State, and the highest that from Westphalia. When pure it is identical with the manufactured vermilion of commerce. The specimens to which we refer appear perfectly pure.

The American quicksilver mine in Lake Co., four or five miles from the Great Western, was recently purchased by George Wright, from Cross & Co., for $100,000. The new owner is putting up a 10-stamp mill to crush the cinnabar ore, which will be then worked in retorts.

Two Knox & Osborne quicksilver furnaces are now being erected in this State, both of 10 tons capacity. One is being placed on the Ida Clayton and Yellow Jacket mines, in Napa county, and the other is for the Abbott mine, Calaveras county.

Riotte & Lueckhardt are building two of these furnaces for the sulphur banks. The castings have been shipped and the furnaces are being put up.

The miners in the cinnabar district north of Sulphur creek, Colusa county, have formed a new district, to be called Valley district. J. B. Turner was elected Recorder.

St. Helena, Napa county, sent away 31,329 pounds of quicksilver during the first five months of this year.

The California quicksilver mine, Napa Co., produced last week 67 flasks—the largest production yet made from the mine.

The Mechanics' Institute Fair.

Preparations for the coming Industrial Exhibition under the auspices of the Mechanics' Institute are rapidly going forward. Work on the building continues uninterruptedly, and from all appearances we will have a fair eclipsing all former efforts in this direction. The managers are all busy in arranging the numerous details necessary for the success of the exhibition, and have plenty of work yet to do. The standing committees of the exhibition are as follows:

AUDITING—W. P. Stont, P. B. Cornwall and George Spaulding.

BUILDING—Asa R. Wells, John P. Curtis and J. H. McDonald.

CIRCULAR AND CLASSIFICATION—J. H. McDonald, J. P. Curtis and Richard Savage.

PRINTING AND ADVERTISING—Geo. Spaulding, Richard Savage and W. P. Stout.

POWER AND MACHINERY—Charles Elliott, Jas. Spier and Richard Savage.

RULES, REGULATIONS AND TICKETS—James C. Patrick, P. B. Cornwall and Asa R. Wells.

MUSIC AND DECORATION—H. L. Davis, R. B. Woodward and Charles Elliott.

PRIVILEGES—R. B. Woodward, P. B. Cornwall and Geo. Spaulding.

LOCATION—James Spier, W. P. Stout and Geo. Spaulding.

POLICE—P. B. Cornwall, H. L. Davis and Richard Savage.

The publication of the *Mechanics' Fair Daily* has been awarded to the proprietors of this journal, who will spare no expense nor trouble in getting out a first-class paper. The journal will be circulated free in the Fair building, so that it offers great advantages to advertisers.

THE Eureka and Palisade railroad commenced on the 1st inst. to transport passengers and freight to a point 20 miles east of Palisade, on the road to Eureka, making a difference of one day and a half in the delivery of freight to Eureka, Hamilton and Pioche. Twenty miles of additional track will be laid as fast as the iron arrives. Stages run in connection with the railroad now for Eureka and other towns south.

Prospects of the California Academy of Sciences.

Our local Academy of Sciences has, by the munificence of James Lick, been placed in a most prosperous condition and one which exceeds the fondest anticipations of its founders. Mr. Lick first gave the Academy a piece of land worth between $200,000 and $250,000, and by his late deed he provides for a fine building on this land and ample funds to purchase books, collections, etc., as well as to carry on the Academy on a firm, substantial basis. The building, such as Mr. Lick desires to be erected, will cost about $250,000; and altogether the sum of his gifts to this institution amounts to one million dollars. We notice, by the way, that our esteemed cotemporary, the *Scientific American*, in speaking of Mr. Lick's gifts, omits to mention that to the California Academy of Sciences, and makes another mistake also; that of stating that the balance of the $1,780,000, after providing for the observatory, monuments, asylums, etc., is given to the Pioneer Society. The whole $1,780,000 is given for these purposes and the balance of *his fortune* is given to the California Pioneer Society and the California Academy of Sciences. Accordingly the Pioneer Society will receive an equal sum with the Academy.

It is not probable that these funds will become available for several years, as the property must be disposed of, and the various sums given in this manner specified by Mr. Lick before the balance which comes to the Pioneers and the Academy will be given to them by the trustees. In the meantime the Academy has pretty comfortable quarters and a sufficient income to move along without trouble. The publications of our local Academy are well spoken of abroad, and it is acknowledged that the association has a broader field of work than similar bodies elsewhere. As Professor Morse said, at a recent meeting of the Academy, "You are the only endowed society on this coast and probably the only one on the borders of the Pacific Ocean.

Professor Morse in speaking of the earlier efforts of our Academy said: "In the East we are familiar with your publications; I wish to tell you that when the first "proceedings" came along, we were somewhat amazed, and thought that some young men were starting it, and the Society would only last a year or so. From year to year you kept on, and we saw that the papers you published showed reasonable research. We saw that you did not decay and were getting on; but we never dreamed that you would get an amount of money more than that all of our Eastern Societies put together."

He then spoke of the different Eastern Societies, their increase and their early struggles. The old Portland Society, after long struggles, got together $8,000 or $9,000, and fixed up an old building to meet in. A fire destroyed it, and we had to begin all over again. In the Museum of Comparative Anatomy, at Cambridge, we have what we may call a rich association. The State gave $100,000, the people, $75,000, and Gray gave $50,000; but the museum has an income of $15,000 only. The Peabody Institute received $140,000 from Mr. Peabody, and the building cost $40,000, so that the interest on $100,000 supports it. At the Boston Society of Natural History, in the early days, they met in a small room; then they got a larger room, but had no working funds, being supported by contributions. They worked and struggled along until they procured a few sums of money, amounting to $15,000 or $20,000, altogether. By and by the State gave it $100,000, and the land upon which the building was. The building cost $120,000, and was more ornamental than useful. More money came in after a while, until now the society is on a good basis. The old New York Lyceum of Natural History is poor now, and meets in a small room. They have no money to publish their Annuals, and have to resort to personal subscriptions to publish them.

Add all these sums together, and the sum given to the Academy of Sciences by Mr. Lick beats all the funds of the natural history societies East. The California Academy now starts with a sum equal to all. Mr. Lick has gone ahead of Peabody, as far as science is concerned, for Mr. Peabody endowed educational institutions liberally, but gave only about $300,000 to purely scientific societies. The position occupied on the globe by the California Academy is a fine one, as it is the only endowed society on the Pacific Ocean. It has plenty of money and a large area for investigation.

Professor Morse in the course of his remarks said: "Science has changed a great deal in the last ten years. Our old proceedings of societies were merely technical; now they are broader. As your President said in his last report, 'There is no money in this country for individual pursuits.' In Europe this is done, but not here. There large sums are appropriated to assist Professor Blank in his investigations. In this country our naturalists are poor. So in a society they must label and paste and do miscellaneous work, and get no time for investigation. The primary object of your Society is to furnish original investigators. Now you have ample funds to employ specialists, and you must impress upon them that they must give the results of their investigations to you. Do not let them be too practical. Do not let the bread-and-butter idea preponderate. There are other things for men to do beside eat and drink and make money."

Mint Operations.

The mint in this city is now closed for annual settlement. The coinage for the year was large, the amount in gold being $22,302,500 and in silver, $2,550,500, making a total of $24,853,000. The gold coined was 74 tons and of silver, 140 tons. The coinage of trade dollars has been enormous, but its immensity can only be appreciable to the general reader by comparison. The number of trade dollars coined was 2,121,000. Each of these pieces required precisely the same work in all the stages of its manufacture that is bestowed on a $20 gold piece. Had the same work, therefore, been bestowed on double eagles, the coinage of these pieces would have represented a value of $42,420,000, in addition to the other coinage specified. Nearly all these trade dollars have gone into the China trade. The coinage for June amounted to $2,393,000, of which $2,120,000 was in $20 pieces, and $259,000 in trade dollars, the balance being in dimes. The coinage statement is as follows:

COINAGE FOR THE YEAR—GOLD.

Double Eagles	$21,950,000
Eagles	10,000
Half-Eagles	156,000
Quarter-Eagles	87,500
	$22,302,500

SILVER.

Trade Dollars	$2,121,000
Half-Dollars	241,000
Quarter-Dollars	129,000
Dimes	59,500
	$2,550,500

RECAPITULATION.

Gold	$22,302,500
Silver	2,550,500
	$24,853,000

NUMBER OF PIECES COINED IN TWELVE MONTHS—GOLD.

Double Eagles	1,098,000
Eagles	12,000
Half-Eagles	31,000
Quarter-Eagles	27,000
	1,168,000

SILVER.

Trade Dollars	2,121,000
Half-Dollars	482,000
Quarter-Dollars	515,000
Dimes	595,000
	$3,714,000

RECAPITULATION.

Gold	1,168,000
Silver	3,714,000
Total number of pieces coined	4,882,000

AMOUNT OF GOLD AND SILVER WORKED BY THE COINER.

Gold Ingots (ounces)	2,170,113.90
Silver Ingots (ounces)	4,070,051.88
	6,240,165.78

Amount in avoirdupois—Gold, 74 tons; Silver, 140 tons.

Lower Rates of Interest.

There are many who manifest a sort of pride in referring to the high rates of interest prevailing in California; considering it as an indication of great energy; and declaring that the fact that we are paying rates of interest double those of our Eastern competitors is evidence of our superior advantages. But how is it that at this time, when the energies of all departments of trade and industry are exerted as they never were before, dividends on loaned money are particularly low? Savings banks, it is understood, will declare a lower dividend for the month just ended, than any previously offered. According to the theory of those who favor high rates of interest, the money-lender should have reaped as bountiful a harvest of real gold in June, as the farmer is reaping of the golden grain in July. But instead of this, their money went begging at six and seven per cent. throughout the month. We look upon this as the best evidence yet produced of our real prosperity at present, and of general confidence in the future. For either our producers and dealers had money of their own to carry them through, or the confidence of capitalists in California enterprise was so strong, that they preferred trusting their money in these currents, even on terms extremely advantageous to the borrower. One of these suppositions must be true, and they are alike in their healthy indications.

LANGLEY'S NEW DIRECTORY FOR 1874 gives the population of this city at 200,770; a gain since March, 1873, of 12,447, or about 7 per cent. The same authority gives the number of buildings erected during the year ending March 1, 1874, as 671, of which 53 were brick. The entire cost of these improvements is estimated at $4,250,000. The number of buildings in the city and county of San Francisco is estimated at 22,600, of which 4,200 are brick. The expense of maintaining the Municipal Government for the year ending June 30th, 1873, is $3,780,000. The bonded debt, March 1st, 1874, is $3,237,000. Actual debt, including floating, $3,503,000. Total assessed real and personal property, October 1st, 1873, was $212,207,535. The directory to which we refer, aside from its usefulness as a means of reference, is interesting in many other particulars, as the carefully compiled notes and figures give the best possible idea of the growth of our flourishing city.

A VEIN of extraordinary richness was struck a few days ago in the mines of the English company in Holcomb valley.

Blatchly's Compound Engine and Boiler.

The first attempt at using steam successively in two cylinders appears to have been made by Horublower, about 1781; but the low pressure at which steam was then used caused it to be a failure. Latterly it was revived by Woolf with higher pressure and better success; but it is only in the last few years that compound engines have occupied a conspicuous place in mechanics.

In a work published this year, Mallet, after comparing the indicator diagrams taken from a single cylinder engine and a double one, says: "It is seen that the final pressure is exactly the same in the two systems, except that there is a defect of area of work in Woolf's engine, corresponding to the loss due to dead space. Calculating the area of this portion, we find the loss due to the use of the two cylinders to be nearly 15 per cent. The majority of authorities rest here, and take this result as a text for condemning the compound engine—at least in principle." Still, it has steadily worked its way into favor, until at the present time the largest and best ocean steamers are provided with compound engines.

The first thing that attracts attention in the ordinary compound engine, is the great back pressure in the first, or high-pressure cylinder. This, however, entails no loss except friction, as the back pressure on the small piston is exactly equal to the front pressure on the large one; and as the small piston advances, it increases the pressure on the large one in perfect ratio with the resistance which it encounters, occasioned by the steam only.

In the Blatchly engine, herewith illustrated, it is proposed to unite several cylinders of different sizes endwise, one opening into another, the largest being in the center, the others decreasing in size each way to the end ones, which are the smallest. Each cylinder is provided with a piston, which is packed with steam packing, and so arranged that, in all of the cylinders except the two smallest, the steam expands the rings before it enters behind the pistons. The steam is first admitted into one of the smallest cylinders, and forces its piston along it and into the piston in the next largest cylinder, when the two pistons are locked together, forming the piston for this larger cylinder. The steam then enters behind this compound piston and forces it along this cylinder and into the piston in the next larger cylinder, where the pistons are locked together as before, and proceed to the end of the stroke, which is at the further end of the largest cylinder. The piston in this cylinder is the only one that receives steam on both sides alternately—that is, double acting.

For the return stroke the steam is admitted into the other small cylinder, and the operation is the same as for the forward stroke. The steam is cut off at the end of the small cylinders, and works in the others expansively. Each stroke arranges the pistons in the other cylinders for the next stroke.

Our engraving represents a longitudinal section of one large cylinder, *A*, with two smaller ones, *B* and *C*, joined to each end. The large cylinder is divided to facilitate opening and for ease of construction. If a greater number of cylinders were employed, they would all be cast together except this division at the middle of the largest cylinder. *a*, *b* and *c* are the pistons, *a* and *c* being joined together by the bars, *dd*; *e* is the piston rod; *I*, the crosshead; *hh* is a sleeve working over the piston rod, *e*, and joined to the piston, *b*.

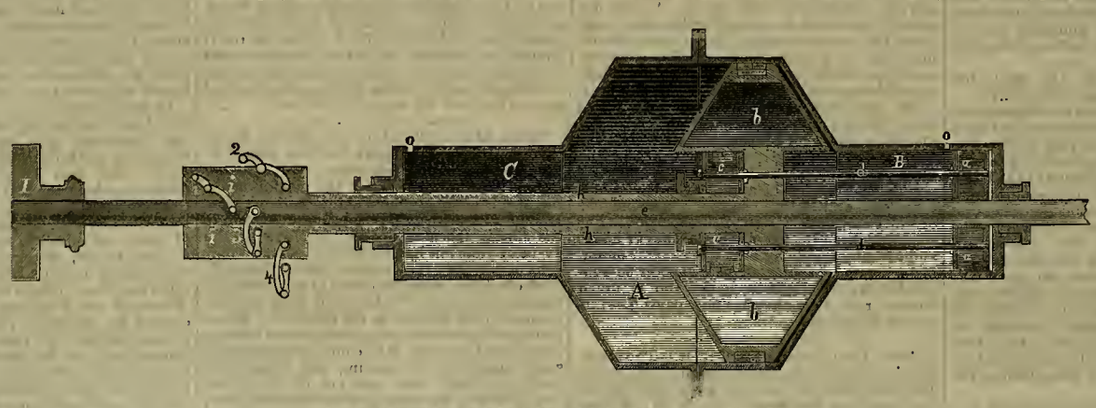
This sleeve, joined to the slider, *i i*, which is connected to the piston-rod, *e*, by pairs of jointed rods, 1, 2, 3 and 4; *oo*, are the ports for the admission of steam.

Steam is admitted behind the piston, *a*, which forces it along the cylinder, *B*; the rods, *d d*, also force the piston, *c*, towards the cylinder, *C*. At the same time, a rod, not shown in the engraving, moved by an eccentric, bends the jointed rod, 1, and the rod, 3, begins to expand. This continues until the piston, *a*, enters into the piston, *b*, and the jointed rods, 1, are closed up, and 3 forced fully open by a rod worked by an eccentric locking the pistons, *a* and *b*, firmly together, and at the same time bending the rod, 2, which moves the piston, *b*; steam entering at the same time drives the pistons, *a* and *b*, to the other end of the cylinder, *A*, which completes the stroke, the piston, *c*, being moved to the further end of the cylinder, *C*, which, in its turn, is ready to receive steam for the return stroke, which is effected in the same manner from the cylinder, *C*, as it was from *B*. It will be seen that the "dead spaces" in this engine are no greater than in the single cylinder engine.

This represents the simplest form of the engine, but the expansion may be continued as far as desired by additional cylinders.

The steam is cut off at the ends of the small cylinders and expands into the others, the sizes of which can be predetermined to give a uniform power throughout the whole length of the stroke, or to increase it at any point, as may be desired. The arrangement allows any desired extent of expansion, with the length of stroke under perfect control. By making the series of small cylinders at each end of the large one of different sizes, steam of different pressures can be used in this engine, the size of the cylinder at each end being in inverse ratio to the pressure of the steam. It is held by many engineers that high steam is more economical than low; but, as it is a mooted point, probably there is not much difference within ordinary pressures. It is however certain that if the flues or tubes in a boiler carrying 150 pounds pressure, are prolonged so that the temperature of the gases from the furnace, passing through them falls below 358°, they cool instead of heating the steam; but if these gases passed through the tubes of a boiler, carrying 35 pounds pressure, they would generate steam until they parted with 100° of heat, and all of the steam in the low pressure boiler would be clear gain over the production of the high pressure boiler. A boiler might be constructed on this plan and both pressures could be utilized in the Blatchly engine, or in the ordinary compound engine, but not in the single cylinder. And there is no doubt that the compound boiler will be as great a success as the compound engine.

Parties desiring further information, or an interest in this invention, should address Dr. A. Bletchly, of this city.



BLATCHLY'S COMPOUND ENGINE AND BOILER.

Work done by the Burleigh Drill.

A short time since we made a statement of the number of Burleigh drills and air compressors on this coast, and the mines in which they were employed. At that time we mentioned those of the Idaho mine of Grass valley. There are four drills at this mine and another will soon be ordered, for shaft sinking. Only two of the drills have been at work so far and the Grass Valley *Union* gives us some information about the work they are accomplishing. The average time of drilling in the Idaho quartz is five feet of hole in each hour, the hole being two inches in diameter. In hand drilling the average is for three men to put in six feet of hole during a shift of eight hours. It will be seen, at once, that while three men are drilling six feet of hole, with hand drills and hammers, three men with a Burleigh machine will drill forty feet of hole.

As an item of interest to the mining community we give below a letter from Gold Run, giving details of the work done by the drills in the Gold Run company's property. R. H. Brown, Secretary of the Gold Run Ditch and Mining company, writes under date of June 5th, 1874, to Parke and Lacy, Agents of the Burleigh drill in this city, as follows:

In reply will say we ran two of the Burleigh drills in our tunnel, which is 8 x 8, 24 days during the month of May, and made 126½ ft. of tunnel, through hard rock, at an expense as follows:

XX Hercules Powder	$1064 43
Fuse and Caps	15 00
Piping Air and Water	129 25
Wood for Boiler	175 00
Coal	16 38
Steel and Iron	60 00
Oil for Lights and Machinery	76 00
Lumber Tracking	25 00
Labor	1400 00
	$2,953 06

The first week in June we made 31 feet of tunnel; the second week struck the most difficult rock to drill we have ever had. However, we made 26 feet of tunnel last week. We count on making 100 feet a month sure and I believe we will average 125 feet until the branch is completed. We are running our rock out by hand. By using mule or steam power I think the expense could have been reduced materially this month. We have worked the car men eight hours and have not been delayed with rocks in the way of the drillers.

NEGOTIATIONS are pending between the Leopard company, at Cornucopia district, Nev., and some Chicago capitalists for the erection of a first-class 16-stamp mill, to be erected for a portion of the claim. If, however, there is no conclusion reached by the parties in question, looking to an early erection of a mill, the company will themselves build one during the summer.

Aaron's Amalgamation Process.

[Written for the MINING AND SCIENTIFIC PRESS by the Inventor.]

No. 1.—Preliminary.

In describing this process I will be as brief as is consistent with clearness, but will beg permission to make a few pertinent remarks before going to work.

The process was invented by me in 1867, while in the employ of the Silver Sprout Company, in Inyo county. That company failed to derive any benefit from it, simply because, rejecting the evidence not only of their ears, but of their eyes also, they refused to have anything to do with it.

I was led to the invention by considering the reactions of the patio, the mother of all silver amalgamation. However, I afterwards ascertained that its chemistry was similar to that of the Mexican process, called in some places "fondo;" in others, "caso y cocimiento." In a pamphlet published some years ago, I stated that the essential principle of the process was old—referring to the chemical reactions—but it will be seen that the *modus operandi* differs greatly from that of Alonzo Berba, who invented the fondo, as now practiced in Mexico, in 1590; of which process the late Professor Rowlandson said, in his articles on the Frieberg process: "It (the fondo) is not likely to be much used in any country where civilization has made much progress," so utterly unfit is it for our times and places.

The process under consideration was never used or known—at least in this country—till I introduced it, and worked successfully ores which not only ignorant people, but assayers and metallurgists, pronounced to be "very rebellious," and to absolutely demand roasting; and the results are so good as, even now, after over four years' working, to tax the credulity of scientific operators.

If I seem, in some points, to differ in opinion from some wiser persons, it must be remembered that circumstances alter cases, and the dictum of any authority, no matter how eminent, must be considered with regard to the conditions under which it was pronounced. It is not possible in metallurgy to lay down fixed rules where conditions so vary. Rules are necessary for novices, but in the life of every intelligent operator there comes a time when experience and judgment take their place and authority cases to be paramount.

The books tell us that an ore to be roasted with salt, must yield thirty per cent. of regulus when assayed for sulphurets; yet, we know that many ores which will not do so can be well chloridized, notwithstanding. A Mexican amalgamator puts in his mercury even when working a Wheeler pan, little by little, so as to keep always a very thick amalgam, while a Frieberg man insist on five hundred pounds with a thousand pounds of ore. The former gets his idea from the patio, in which there is a reason for it; the letter from the usual Frieberg practice, as described in books. There are, however, cases and places for both methods, and for a medium course. So, also, in regard to the consistency of pulp, which is made thick in the patio, to prevent the mercury from going to the bottom, and staying there; and in the Frieberg barrel chiefly for the reason that otherwise the scrap iron would wear out the wooden staves. I have reason to know, however, from repeated experiment, that it is not necessary to work a thick pulp in pans or barrels, especially when, in barrels, copper instead of iron is used for reduction; as in that case every piece of copper becomes coated with quicksilver, and reduction takes place in contact with the latter, so that amalgamation is simultaneous with it. Certainly, the wear of barrels is greater with this pulp, and the solution of salt, etc., is more dilute, but with lined barrels the wear is a small matter, and the saving in power is sometimes a great one; also a thin pulp circulates more perfectly.

Again, in regard to settlers, the general practice is to have a wide, shallow vessel, with very slow motion of the muller or stirrer, which is fitted with teeth like those of a harrow, or with plowshares and cultivators, the result being that sand and quicksilver go to the bottom, where the unhappy mercury is not allowed to remain in peace, but is harrowed, and vexed, and scratched up with the sand by the plows and cultivators, where any coarse metter is difficult to get rid of, without losing quicksilver. An experienced mill man in San Francisco was horrified to hear that any separator, six feet in diameter, made over twenty revolutions per minute; yet, a better one I have never seen, and it throws coarse sand out at eighteen inches from the bottom, while rocks, or pieces of copper, etc., as large as walnuts, simply get out of the way, and wait till it is convenient to remove them.

Now for business. It is a common saying among the Mexicans that "mercury has no teeth," and although, for roasting, a rather coarse pulp may sometimes answer best, yet for amalgamating, especially in raw working, the ore cannot be too fine. There is, however, a great difference in ores in this respect. Samples from the Comstock vein yielded readily 90 per cent. of the silver, and 80 per cent. of the gold, without very fine crushing, while the Blind Springs ore requires to be passed through at least a 60-mesh screen to give first-rate results.

It is immaterial whether the ore be crushed wet or dry, but, in wet crushing, the slime must be carefully saved; I have always found it as rich as the ore it came from. I think, when the ore does not contain too much clay, filter vats should be used instead of the usual settling tanks; the retention of the slime with the sand would not only prevent loss, but would also greatly facilitate handling.

I have not yet tried Penl's pulverising barrel, but it would appear that no machine could be better adapted to preparing ore for this process, using screens of 80 or 100 meshes to the lineal inch. An arrastra does very well, but, though it grinds very fast when first charged; yet in working big charges, if fine work is to be done, it becomes slow and tedious; and, if there is much clay in the ore, it is impracticable to get all fine, as the pulp must be kept thick enough to work in the barrel, unless indeed large vats are provided for settling, and then the slime from some ores will hardly settle in a week. This machine will work very well without water, but I have not found a satisfactory way to get the dry pulp out.

An arrastra, however, can be made to work continuously, like a battery, not by floating—at least I have not succeeded in that way—but by placing a sufficiently firm screen around a part of its circumference. The screen must not extend quite to the bottom, and the supply of ore and water must be so regulated that, while the pulp is thin enough to pass through the screen, it is also thick enough to prevent the sand from packing. I commend this plan to the attention of parties working gold rock; it will of course be requisite to use amalgamated plates, etc., the same as with a battery, when working for gold.

The bottom of an arrastra should be formed of thin pieces of rock, set vertically, and where only grinding of silver ore, and not amalgamating, as with gold, is required, no tamping with clay or other special care is needed. It should be, however, tolerably level, and the pavement should not extend all over the bottom; but a space about six inches wide should be left around the side and center post, which must be filled with beaten clay. Without this precaution the grinding surface cannot be kept level. The drags should be as heavy as the power will allow, and so hung that the front edges will be raised a little, otherwise they will not run smoothly.

I give these particulars because, though not likely to be used in large operations, the arrastra is a better machine than is generally supposed, and may be used with advantage by persons of small means, being cheap to construct and requiring less attention than a battery.

If convenient, a pen may be used to reduce the pulp to the requisite fineness, though the amalgamation can not be done in it for chemical reasons. With poor ores free from copper carbonate, and therefore requiring limestone, the iron ground off the shoes and dies would be objectionable on account of consuming bluestone and making poor bullion.

OAKLAND BAR.—The city of Oakland has expended at one time and another about $30,000 to deepen the water on the San Antonio bar. The Congressional appropriation of $100,000 will only be sufficient to put in training walls to keep the channels from filling up. This being done, it is expected that further appropriations will be made, so that in the end from a quarter to half a million will be expended for the improvement. When the channel across the bar carries a depth of six feet at the lowest tides, it is expected that a line of ferry-boats will be put on the creek route. At present, both the Ball and "Clam-shell" dredgers are at work on the bar, and in a few weeks more it is expected that the channel will be deepened to the required depth.

Pioche Mines.

We take the following items from the Pioche *Record* of June 21st; Though there has nothing striking occurred during the past week, we think we will be justified in stating that the feeling is more cheerful, and more confidence ie expressed in the future. Looking over the returne of the export of hullion from this place, we find that for the five months ending the 31st of May, it amounts to several thoussnds over one million dollare. This, considering the unexsmpled depression of the mining interest of Pioche during the eame period, certainly cannot be said to be a bad showing. It should also he recolleoted that the two great mining enterprises of this region—the Raymond & Ely and Mesdow Valley—are self-sustaining, if nothing more. In both mines an immense amount of proepecting and desd work is being done, yet the shsreholders are not being called npon for aseessments. In fsct, it can he said for the Raymond & Ely, what it is doubtful can he affirmed correotly of any other company, the shares of which are quoted on the Stock Bosrds, thst ite shareholders have never yet been asked for a dollar in the shape of assesements. Though it seems to be tbe fsshion in San Francisco and other places to give the mines of Pioche "a black eye," we feel very certain that eo soon as the region below the water level in the Rsymond & Ely and Meadow Valley ie explored, tbe yield of the Pioche mines will be greater than ever, and that a lssting period of permanent prosperity will commence. In this counection we are glad to learn that the Raymond and Ely Co. has commenced preparing the necessary pumping machinery to free the mine from water. From the greet depth of the ehaft—1,200 feet—the machinery will have to be very msssive snd costly, but while the enormous msss of tailinge collected at the mills psy in tbe mauner they do, it will be very unlikely that the expensee of purchasing and putting the requisite pumping gear in plsce will not he taken out ss fsst as they are incurred.

The export of bullion for the week, per Wells, Fargo & Co., amounts to $41,412.70.

Yesterday, when we were at the Raymond & Ely, we leerned that no ore whatever had been taken oot or raised during the past week. The only operations that ars heing actively prosecuted are opening the eastern branch of the 1,200-foot level, and continuing the oross-cut through the cross-head on the western side. The first is in 75 feet, and the latter 49 feet from the point where the vein was first intersected. The face of the eastern drift has not changed since our lsst report, and shows no ore. The western drift, of course, does not exhibit any, as at present it is running through the cross-head. Tbe Magnet company continues to raise oonsiderable ore, eay from 20 to 25 tons daily. The grade, though still somewhat low, ie slightly improving, and is also yielding the metal a little more freely.

At tbe Meadow Valley Company's shaft, No. 3, we found that the western drift of the lower level was in a length of 82 feet from the point where the vein was cut. The face has improved considerably since this drift was commenced, and now ehows some low grade ore, and is very promising in its appearance. The eastern drift of this level is 44 feet in length, and is progressing through a break or fault. On the lowest level but one, No. 11, the eastern drift ie 235 ft. in lengtb. The face shows many emall etreake of ore, and looks as if it might ehortly make into a solid ore body. On the western side of this level a winze has been sunk about 150 feet from the shaft. It ie now 114 feet in depth, and showe a strong vein, bot little or no ore. On tbe ninth, the eastern drift has reached a total length of 860 feet, 15 feet beyond the junction with tbe crosscut from the Summit shaft. The fsoe ie the same as usual. On the western aide of this drift and above it, stoping ie going on as heretofore. The quality of the ore taken ont is abont the eame. If there ie any difference, it is a trifle lower grade. Four hundred feet from the shaft on the eastern eide of this level a winze has been sunk to the depth of 117 feet, and the bottom looks well. Altogether the appearances in this portion of the Meadow Valley ground certainly look much more cheering tban they have for some time, and afford some reasonable ground for expecting a brighter future.

Mexioan Mines.—A report from Jilila, in the State of San Lnis Potosi, mentions that the eaid valley may be considered the richest in all Mexico, offering all the produce of the three Mexican zones, from the hottest to the coldest; while it freezee at five leagues north, tropical fruits are gathered at Portla, a forest, only three miles off, where coffee trees are found which yield from 20 to 30 pounde per tree; and the mines of eaid district are so rich that a certain ore (containing silver and platinum) is worth two dollare per pound by the assays made at Pachuca. Five hundred men are at work now to build a road from there to Queretaro. At Sain, a quioksilver mine hae been discovered, of such richness that it is eaid to beat the Spanish Almaden. This would be a veritable God-send for Mexico. In the district of Cosala, State of Sinaloa, a mine of bismuth has been discovered, similar to the bismuth of areenic found in other countries, and rather scarce.

In a French industrial establishment employing 630 men, chiefly vegetarians, the introduction of animal food eaved twelve days' work a year per man, which had previouely been lost through illness or fatigue.

The Livermore Coal Mine.

In our ieeue lsst week we gave eome interesting points in regard to the H. A. mine, located near Haywood, in this connty. We now furnieh our readers with the following fscts in regard to the Livermore coal nine, which is located about seven miles south east from this place, through the kindnees of W. W. Winn, Esq., President of the oompany.

In 1869 Mr. Thomas Harris and Mr. Jenkins Richard, both gentlemen being experienced coal miners on this cosst and in Englsnd, concluded that the indications for coal in Corral hollow were very flattering, and accordingly eank a shaft about 60 feet, in a promising location, and struck a fine vein of coal eix feet in thioknese. But owing to their capital being limited, they could not proceed witb the develonment of tbe mine, and accordingly eold it to a company of gentlemen in Stockton. About the same time two other veins were discovered in the eame neighborhood, one of which is known as the O'Brien mine, and the otber ae the Commercial. The O'Brien had a vein of cosl nine feet in thioknese and of excellent quality, and the Commercial one of eight feet in thickness. The vein struck by Harris and Richsrde and these two were parallel with each other, and ran nearly esst and west, with a dip to the north of ahout 45 degrees. The dietance between the three veins was about 300 feet.

The two gentlemen above named having become familliar with the direction and surface formations here followed the oouree of the vein weetward nntil they reached the sonthseetern border of the Livermore valley, where they located 160 acres of land, npon which tbey discovered fine croppinge, but owing to the unsettled titles nothing was done towards developing the mine until a ehort time since, wben they procured title to the land, and now an organized company have taken hold and are actively pushing the work ahead. A shaft has already been sunk to a considerable depth, and a fine body of coal found. From tests already made this coal ranks high, and the company anticipate taking out eufficient to supply a considerable market hy the first of September next.

We have not made a personal visit to thie mine, but are perfectly satisfied thst from the energetio character of the managere and the general description given, we shall have a coal mine opened here that will not be excelled hy any in the State. The approach to the mine ie a fine one, and Nature hae supplied abundance of water and timber in the neighborhood. Tbe company intend to put on a donble set of hands and run night and day next week. Our mannfacturing and machine ehops will soon be supplied with coal right at home and at much cheaper rates than they are now paying.—*Livermore Enterprise.*

Santa Rosa Branch N. P. R. R.—The stockholders of the Santa Rosa Branch North Pacific Railroad Company met last week and elected the following Directors: W. S. M. Wright, George A. Tupper and A. T. Farmer of Ssnta Rosa, and John F. Keseing and L. B. Latimer. The Directore eleoted the following officere for the first year: John F. Kessing, President; W. S. M. Wright, Vice-Preeident; E. T. Farmer, Treasurer; W. W. Morrow, Secretary, and L. B. Latimer, Attorney. The Treasurer was autborized to open books for the subscription to stock at Santa Rosa. The survey of tbe road will be commenced immediately. This rosd will be from 12 to 15 miles in length, and connect with the North Paoific Coast Railroad, either at Freestone or Valley Ford. The President and Attorney were authorized to confer with the Directors of the North Pacific Coaet Railrosd Company, and arrange in regard to connectione, passage and freigbts and other matters relating to the connecting linee. The Directors expect to have this road completed by the time tbe main line is finisbed from Ssucelito to the point of connection.

Cassiar Mines. — The Portland, Oregon, *Bulletin*, of the 22d ult., furnishes us with the following, relative to the Cassiar mines:

"The news from the Caseiar mines is to tbe effect tbat the greater part of the auriferous region has been over-run with high water, and it is thought that active work will commence about the first of July. There were about 900 men in the mines on the fourth of June, and the majority of these were waiting for the flood to subside before going out prospecting. The mines on Dease creek that were being worked were turning out very well. Before the freshet came on, three men on the creek are reported to have taken out 174 ounces in four days.

A private letter received in this city states that the place is a terrible one, and that the population are feeling the extremes of heat and cold in each 24 hours. Several parties have been taken down with lung fever in consequence of these changes, among them A. J. Knott, of this city, who narrowly escaped with hie life. Tbe camp is represented as being a fraud, and that but few of those in the district are making expenses. The writer was working at $10 per day, and we doubt not will soon start for home."

The Yakima Mines.—Henry Cook, Esq., who returned to the city on Thnrsday from a visit to the Yakima country, informs us that the miners have all left Swauk creek and have croseed over to tbe Yakima river, where they found good prospects, but owing to high water have been unable to perform any considerable amount of work. There are 75 men on the river waiting anxiouely for the water to reeede.—*Walla Walla Statesman.*

Indian Creek Gravel Mines.

The Trinity county *Journal* ssys: We visited this mining camp on the 20th inst., but found little of interest to report. There are ahout 100 men—including Chinese—mining in that eection, and all are doing well.

The gravel mines of Indian oreek and vicinity are among the richest in the county, and about the hardeet to work. The creek bars, to whioh the mining is confined, lie on a level, and, in some instancee below the bottom of the creek, and are exceedingly rocky. Worked nnder attending disadvsntages, they all pay largely, the yield to the ton or cuhio yard of earth prohably averaging larger than in any other dietrict in this county. In fact, it is an absolute necessity that the gold must he plenty, or the slow manner in which the low bars have to be worked would not pay expenses, let alone affording the handeome profits to owners which they do. On either side of Indian creek are large beds of grsvel, several hundred feet above the jstream, in which no work and hut little prospecting hss heen done, there being no ditch high enough to cover them. So fas as ascertained, there are not as msny nor as large rocke in the high deposits as in those below, but tbe extent and richnees of the gravel forming the upper benches has yet to be found out.

"Quartz on the hrain" wss the prevailing malsdy when we were there. In the mountains, several miles eoutheast of the town, pockets of rich float qnartz are found, and mnoh time hae been spent hnnting for the ledge. On Saturday lsst, Siegfried and party returned from a prospecting trip and reported having discovered the lode. They bronght with them sbout 50 pounds of thie rock, in much of which free gold could be seen. Four pounde of this rock, crushed in a mortar and panned out, yielded 50 cente, or at the rate of two hundred and fifty dollars per ton. A day or two later Stoddard, Bowie and otbers found a ledge about three quarters of a mile from the point discovered by Siegfried. The quartz ie eimilar in character, and it ie prohable that both partiee have found the same ledge, tbough at different points. Men will be put to work at once to discover the extent of tbe lode.

Emma Mine.—The London *Mining World* saye: The following report hae been issued hy the nndermentioned gentlemen, and is ae follows: "For a full report of tbe general meeting of thie company, held at the Csnnon Street Hotel on the 15th of May, we must refer you to the *Mining World* of the 16th of May. In tbe event of your not having been present, we may inform yon that the meeting was principally controlled by certain members of the Stock Exchange, a msjority of whom had only recently acquired their intereet in the compsny. These gentlemen, professing opinions opposed to thoee entertained by your late committee of conference, succeeded in electing one member ae their nominee on the board of direction, and in adjourning the meeting until the 9th of June, for the purpose, amongst other msttere, of electing another director. For reasone which are apparent, it is to be regretted that the articles of aesooiation grant to all shareholders power to vote—without reference to the period of holding their shares. We therefore desire your assietance towards arreeting any undue exercise of such power by the gentlemen referred to, and in vindicating the right of such sbareholders who have had a more permanent interest in the company to their legitimate voice in controlling its affairs. The 'independent management' which tbese gentlemen desire, can only, in the present state of the company's affairs, result in fresh compliostion, and possibly further disasters.—Msjor-Gen. R. B. McCrea, J. Wood."

The Use of Paper.—Accordiog to a recently published etatement, it appears tbst there are 3,960 paper manufacturers in the world, employing 80,000 meu and 180,000 women, besides 100,000 employed iu the rag trade; 1,800 millions of pounde of paper are produced aunnally; one-half is used in printing, a eixth for writing, and the remainder for packing and other purposes. The United Statee, with 3,000 machines, produce yearly 200,000 tons of paper, which, for a population of 48,000,000 averages 17 lbs. per head; an Englishman only consumee 11¼ lbs.; a German, 8 lbs.; a Frenchman, 7 lbs.; an Italian, 3½ lbs.; a Spaniard, 1¾ lbs.; and a Russian only 1 lb. aunually, on an average.

Lung Power.—Dr. W. H. Stone, who has been studying the pressnre on the lungs during performance on wind instruments, has ascertained that the extreme hight of a column of water supported by the muscular act of expiration transmitted by the lipe is about 6 ft. He also desired to discover what was the actual pressure corresponding to tbe full production of a note on each of the principal wind instruments. It was found that with the majority of wind instruments the pressure required by the high notes ie considerably greater than that reqnired for the low notes, each instrnment having a pressure-ratio of its own. The clarionet is an exception to the rule.

The Terrible company commenced operations with one end of their new concentrating works this week, which has a capacity of 20 to 25 tone per day. It ie expected the remainder of the worke will be in readinees for operation next week. As soon as these works are in complete rnuning order, it is probable that they will be operated day and night, and the amount of ore added to the ehipping liete will be very great.—*Colorado Miner, June 20th.*

Alpine County Mines.

Why Mining did not pay in Alpine.

No carefully observant eilver miner who examines it can fail to be impressed with the belief that Alpine ie one of the most exteneive eilver mining districts of either California or Nevada. Nor can he fail to wonder how it has hitherto failed to attract the attention of intelligent miners and mining capitalists. But should he be accurately informed of the history of mining operatione here he would probshly cease to wonder at anything. However, we cannot accurately give tbe information as to the history, because we don't know. But possibly, like many other promising and rich districts, it was killed in its infancy by ignorance and stupidity, or else by bad, foolieh and dishonest mansgement. One fact, however, ie nndieputed—that it started off well, but early ceased to he a bullion producing region, and the minere left for the many other new fields of excitement then attracting the attention of miners all over the country, from the failing or exhausted gold placers of California to the new and rising silvor minee of Nevada.

An examination of tbe high mountains sonth and eset of Monitor reveals the fact thet st an early day the country was run over snd slightly prospected by gold miners from the western slope of the Sierrss, and it ie evident that these early prospectors or explorere knew little if anything about silver mining. This early proepecting was all done ae far hack ae '61 or '62, and notwithstanding the many fine looking and perfectly formed quartz ledges, bearing silver, and some aseaying very highly, not a liok of work bas been done since. In fact, for more tban a dozen years this whole region hae been totally neglected by minere. Trne, the country is rough and insocessible, hut not more eo thsn most otber rich mining regions. The same as the above is eaid to be true of much of tbe country and many ledges in the neighborhood of Silver mountain. So it eeems the first attempt at prospecting the country was abandoned without even an effort being made to prove the value of the ledgee eituated on the higher and more inaccessible mountsins.

In 1864–5 many claime on Monitor creek and near Carson river fell into the hande of, or were controlled hy a lot of Eastern men, of whom the most charitable thing that osn be said is that they knew very little aud cared mnch lees about the real value of the minee. Companies were formed, high-sounding ciroulore, adorned with charte and maps and plane of mines and mills and tunnels and wagon losds of eilver bricks, were gorgeously printed and scattered all over the Eastern States, and stock sold from New York to tbe furtheet bounde of Wisconsin and Michigan. Even Johnny Bull opened his plethoric pnrse and with golden guineas tickled the palm of hie sharp-noeed cousin Jonathan by taking etook in Alpine. Experts and profeesors who didn't know a quartz rock from a briokbat were eent out to examine and report upon the mine, and lef badly frightened at the story about a grizzly or at sight of the yawning chaem of a hole in the ground. Clairvoyants and spiritnal medinme were consulted, mille were built, tunnels run at rsndom and in all possible directione, reeulting of course in loes and failure to all save the wily projeotore of enterprises at once grand and magnificent.

Besides all this, numerous home companiee were duly organized and incorpotated, snd stock iesued and sold by the busbel—and all on claims located on the banks of Monitor creek, within a spsce of about one mile, and of eaey access, being directly on the publio highway or main street within the corporate limits of the town of Monitor! Tbese maguifioent locations were assumed to be the only olsime in Alpine county; all others were eeverely if not politely ignored. A few men claimed everything, and assumed to rule everything. Tbey made money at the expense of foreigu viotims, but failed to attract an influx of real enterprising working miners, without which no distriot ever did or ever will succeed. So of oonrse mining here hss hitherto proved to be a total and disastrous failure, and tbe district died—was killed as dead ae a mackerel, and no roee blooms over its untimely grave. Foreaken and abandoned by those who ought to have been its fostering guardians, the qnestion now is, can the district be galvanized into a new and more healthy life? The mountains are teeming with ledges of rich ore, unworked, unclaimed and unprospected, awaiting tbe pick and drill of the faithful miner to unlock and open nature's rich storehouse of wealth.—*Alpine Miner.*

The Lida mill, which haa recently come into possession of General A. L. Page, will be started up some time next month, heing now in complete running order, and only waiting the arrival of quicksilver and some other necessary eupplies. At the "Frenchman's mine," there are about 200 tons of ore on tbe dump which will work an average of $150 per ton, and a large amount of first-claes ore is being ehipped to Columbns, which works $400 per ton and upwards.—*Reese River Reveille.*

Battle Mountain.—The bullion mines are looking up. C. W. Fraser has juet received encouraging reports from the Lone Star mine, in which he is interested. At the depth of 20 feet in the shaft they have eight inches of pay ore, yielding at the rate of $198 to the ton. The "pay streak" as it is called is widening—so that the promise for a heavy mine is good. Bullion bids fair to justify the title given it, before tbe aummer is out.—*Measure for Measure.*

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for yon to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

ARE YOU GOING TO PAINT?

THEN USE THE BEST.

THE AVERILL CHEMICAL PAINT

WILL LAST THREE TIMES AS LONG as the best lead and oil, without CHALKING; is of any desired color. It is prepared for immediate application, requiring no Oil, Thinner or Drier, and does not spoil by standing any length of time. It is equally as good for inside as outside work; over old work as well as new; in fact, where any paint can be used the AVERILL CHEMICAL PAINT will be found superior to any other. Any one can apply it who can use a brush, which truly makes it the FARMER'S FRIEND.

IT IS JUST THE PAINT FOR THE AGE.

IT IS SOLD BY THE GALLON ONLY.

One gallon covers 20 square yards 2 coats.

For further information send for sample card and price list.

MANUFACTURED BY

The California Chemical Paint Company.

NEVADA COUNTY MINES.—The present will be a prosperone year for Nevada county. Many new mines have been opened, and some of the old ones have been extended or more extensively opened, and the gold yield is much greater than for many yeare. Up to the end of this month the ehipmente exoeed those of last year, for the same length of time, over four hnndred thousand dollars. The present month exceede those of the same month last year over $70,000.

PURCHASE OF MINING PROPERTY.—General A. L. Page, of Oakland, has purchased the entire property of the Lida Mill and Mining Company, eitnated in Lida valley, near the boundary line between Esmeralda and Nye counties, in Nevada. The property conoists mainly of a ten-stamp mill, eight mining locations, incldng the town site of Lida City, together with a large amount of chattels.

A RUMOR DENIED.—Prominent railway offioials aeoert that there is no truth in the rumor that Charles Crocker is to supereede Governor Stanford in the Presidency of the Central Pacific railway. They eay that there has been no thonght of ench a change.

W. KENNEDY, while sinking a well for the new hotel, in East Napa, on the 26th nlt., discovered a stratum of gravel mingled with clay, which, on washing, showed a fair prospect of gold. The metal was in small grains, some as large as a pin's head, mixed with black sand.

IT IS stated that samples of agricultnral produots are being secnred in Dixon for the Centennial exhibition. Let them be exhibited to our own oitizens at the Mechanics' fair. We wonld like to see a department in the fair for articles intended for the Centennial exhibition.

STICKEEN. — Mr. Gallagher, who retnrned from Stickeen on the 26th ult., says that perhaps 50 men now in the Stickeen mines stand a chance of making big money, and 1,200 stand a chance of getting out alive, if they are in luck.

LAET week the San Bruno mill, Calaveras county, yielded 121 ounces, worth $2,117.50—an average of $30.25 per ton—from 70 tons of ore. Twenty thousand dollars have been netted from the San Bruno during the paet six weeks.

THE Calaveras *Chronicle*, of June 27th, saye: Work ie progreesing with very favorable resnlts at the Quaker City mine, near the Junction. A fair grade of ore is now being taken from the level.

HON. JOSEPH G. WILSON, formerly Commissioner of the General Land Office of the United States, snbsequently President of the Enropean and Oregon Land Company in San Franciaco, died last week in Washington.

WILLIAM CRONAN, one day last week, picked ont of the widow Hennessy's olaim, at Brown'e Flat, Tuolumne oonnty, a chnnk of solid gold weighing 15 onnces, valued at about $280.

STEEL rails are being procured by the Virginia and Truckee Railroad Company, and soon will replace the iron onee on all the cnrves of the company's road.

HENRY G. HANKS, President of the San Francisco Microecopical Society, has been elected Corresponding Fellow of the Royal Microscopical Society, of London.

THE miners of Egan cañon and Cherry creek have etruok, to resist a rednction ot their wages from four dollare to three dollars per day.

THE circulation of trade dollars is daily diminishing in Nevada, owing to the fact of their being bought np hy the Chinese merchante of San Francisco.

THATCHER & Co., of Monte Cristo, Sierra conuty, took out abont $2,000 last week, three men working.

CORNUCOPIA just now is very dull, owing to the cessation of work by the principal companies on their mince.

THE mill being pnt np on the Zacetero mine, at West Point, Calaverae conuty, ie nearly completed.

THE Contra Costa Water Company has 1,500 regular customers. The daily coneumption of water is 2,500,000 gallone.

THE Crown Point Mining Company are at present putting in the heaviest hoisting maohinery on the Comstock lode.

A NEW city is epringing np on the Jefferson river, Montana, coneequent on the recent mining developments there.

THE reduced throngh fare on the overland road will be $125 for first-olass, and $100 for second-olase tickets.

CHINAMEN are buying nearly all the mining olaims in Timbuctoo, Yuba conuty.

THE York Bros., near Downieville, took out 54½ ounce of gold laet week.

BASKET-MAKING is a new industry at Carson City.

THE road to the Panamint mines, by Surprise cañon, from Los Angeles, is fully completed.

General News.

A TRYING scene was recently witneseed in one of the departments at Washington. It eeems that some 500 employees have recently been dismissed, a large portion of whom were females, many of whom were adults, with families depending upon them for their daily labor. A few days eince, when the names of a large number were read off and diecharged, some 14 immediately fainted at the announcement, and phyeicians had to be called in to reetore them to conscionsnees. The scene ie described as having been heart rending in the extreme, and showe to what straits the poor are driven in that great city, where so many millione of dollare are being abstracted by Government offices and contractore to bnild up princely fortnnes for a few. Surely the day of retribntion can not be far away.

ARCHITECT MULLETT is now accused of letting the contract for stone for the Cincinnati Custom House at a price less than the cost of transporting the same from the qnarry to Cincinnati. The mystery connected with this eingnlar contract appears to have been solved by the discovery that by an agreement with Mnllett, the granite company are also to have the cntting of the stone at an enormous profit. When will the Government officials be compelled to deal honorably and above board with the people?

THERE is a probability of a coming soarcity of rice. A notification has been published by the British Minister to the effect that the Japanese government again prohibit the exportation of rice and grain from Japan, after the 1st of August. The rise in price is looked upon with some seriousnees by the government, and they have not oonfidence in that sufficing to prevent the export, and to induce import, even should it continne.

MACMAHON appears to be quite defiant of late, and according to *La Patrie* has recently declared that he would not cede his anthority to any one for a single day, and he refused to hear of either a Stadholderate or the Lieutenancy-General of the Kingdom. Thie ie snbstantially confirmed by a declaration to the same effect in an order of the day congratulating the troops on the succese of the late review at Longchamps. The Legitimists are very indignant at these expressions of the President.

THE total expenditures by the United States on public buildings and other improvements, in the Dietrict of Colnmbia, from 1850 to June 30th, 1874, amonnts to $65,746,929 29. We are not told how many of these millions have gone into the bands of Government officials and sontractore, in excese of what was necessary to secure an honest performance of the work.

THE Beecher-Tilton scandal has been the general topic of conversation the past week. Beecher simply puts in a flat denial to his friends, privately; while Tilton re-iterates, and says the half has not been told. It is a most unfortunate and deplorable controversy, which, it would appear, for the interest of all partiee, should be definitely settled one way or the other.

THE great California ship "Three Brothers," Captain Cummings, sailed a few days since on her voyage to San Francisco, crossing the bar at Sandy Hook, nnder fnll sail, with an eight knot breeze. She waa accompanied down the bay by a large party of gentlemen. She bringe over 4,800 tons of freight to this oity.

THEY have a child at Athol, Mass., which possessee the singular propensity of gnawing aud chewing its own fingere. He has pursued thie habit with such fatal persistency as to reduce all the fingers of both hands to raw and bleeding stnmpe, while of the thnmb of the left hand nothing whatever remains. His parents were first cousins.

THE Collector of Customs, at San Diego, was called to his door a few evenings since, when he was seized by ruffiane, who searched his pockete, found a menorandum of the combination of the safe lock, opened the safe and abstracted therefrom some $3,000, with which they made good their escape.

FOREIGN correspondence shows that the Irish mob demonstrations against Rochefort were incited by Reuter's New York telegram, saying that he had published a letter approving of the Communists' burning and executing, which included the massacre of the late Archbishop of Paris.

THE English locked-out farm hands are largely agitating their cause. A deptation of 100 have started on a tour, in a body, intending to pass through all the principal agricnltural counties, to address and stir up their fellow laborers, and enlist them in the same canse.

FRESH complications are threatened in Asia. Caravans arriving from Central Asia bring reports that the Yankoab Bey ia arming against Russia. It is believed that he is prompted to this by agents of Great Britain. There is also a possibility of a collision between Russia and Chiua.

HENRY GRINNELL, the well-known New York shipping merchant, died in New York a few days since, at the age of 87 years. He will be remembered by many as having fitted out two vessels, at his own expense, to search for Sir John Franklin.

THE Pope, it is said grows weaker daily, and several foreign representatives have notified their Governments to that effect.

MR. William L. Hoover, a well known oitizen of Gilroy, largely interested in the California tobacco cnring proceee, shot himself dead at the Cosmopolitan hotel, in this city, a few days eince. No definite cause hae been assigned for the rash act.

NEW POST OFFICES.—Among the new post-offices announced the past week are 20 for California; 1 for Nevada; 4 for Utah; 3 for Arizona; 3 for Oregon, and 7 for Waehington Territory—38 in all for the Pacific Coaet in one week.

GRAND DUKE NICHOLAS, in addition to banishment to the Caucasns for life, has been deprived of the Cross of St. George, which wae bestowed npon him for his achievements in the Khiva oampaign.

THE *China Mail* says that the project of introducing telegraphs into the country is something more than rumor, and that the Canton Viceroy ie interesting himself in it to an unexpected extent.

JOHN BAKER, who murdered the mail-carrier Kline, near Burgotville, Shasta county, last winter, was oonvicted of murder in the first degree. Penalty, death.

THE Salinas and Monterey railroad will be completed by the first of September, and the Sonthern Pacific contemplate building one between Castroville and Monterey.

CHARLES CROUCH, the half-breed tried in Shasta county for the murder of Mrs. Radler, hae been fonnd gnilty of murder in the first degree; penalty, death.

A THOUSAND year old clock from Japan has been received in San Francisco. From its announced age one wonld presume it to be a sun dial, which it ie not.

VERMONT, this year, tnrne ont 7,500 tons of maple sugar, worth $1,500,000. She ie the banner State in this enterprise, exceeding the yield of New York.

THE office of Commiesioner of the Diatriot of Columbia has been tendered to Gen. Ketchnm, of New York, bnt he has not yet signified his acceptance.

THOSE Paris journals lately suppressed have now re-appeared.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., June 30th, 1874.

FOR WEEK ENDING June 16th, 1874.*

PEACH AND PLUM-CUTTING MACHINE.—Philo J. Isbell, Placerville, Cal.

AMALGAMATOR AND CONCENTRATOR.—William H. Patton, Oakland, Cal.

GRAINING MACHINE. — Charles Rapp, S. F., Cal.

BELLOWS.—James Campbell, S. F., Cal.

DRAFT EQUALIZER.—Josiah Dodge, Grass Valley, Cal.

COMBINED PUMP AND CONDENSER FOR STEAM ENGINES.—Charles C. Farioot, S. F., Cal.

TANK ROOF.—Henry G. Fiske, S. F., Cal.

VAULT COVER.—William Lynch, S. F., Cal.

GUIDING BALLOONS.—Charles F. McGlashan, Truckee, Cal.

ARTIFICIAL STONE.—Ernest L. Ransome, S. F., Cal.

MOLD FOR MENDING CRACKED BELLS.—Daniel L. Riggs, Salem, Oregon.

DESIGN.

CENTERPIECE.—Samnel Kellett, S. F., Cal.

*The patents ara not ready for delivery hy tha Patent Office until soma 14 daye after the date of ieena.

NOTE.—Copies of U. S. and Foreign Patents furniehed by DEWEY & Co., in the ehortest time poeeible (by telegraph or otherwise) at tha lowest ratee. All pstent hnsinese for Pacifio coaet inventors transacted with perfect security and in the ehortest time poeeible.

Ayer's Cherry Pectoral,

For Diaeases of the Throat and Lunga, snoh as Conghs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.

The few compositions, which hava won the confidence of mankind and hecome household words, among not only ona, hnt many nations, muet hava extraordinary virtnee. Perhaps no onè ever secured so wida a reputation, or maintained it so long, as AYER'S CHERRY PECTORAL. It has been known to the publio ahout forty years, hy a long continued eerice of marvellous cures, that hsva won for it a confidence in ite virtnes, never equalled hy any other medicine. It still makes the moet effectual curee of *Coughs, Colds, Consumption*, that can he made by medical skill. Indeed the CHERRY PECTORAL has really rohhed theee dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effecte, that is well founded, if the remedy he taken in eeason. Every family ehould have it in their closet for the remedy and prompt relief of its members. Sickneee, euffering and even life is eaved hy this timely protection. The pruoent ehould not neglect it, and the wise will not. Keep it hy you for the protection it affords hy its timely uee in sndden attacke.

To Mining Secretaries.

An amendment to Section 335 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the lsw:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

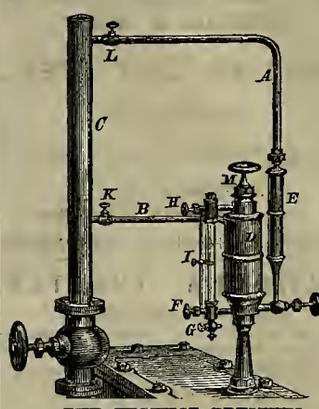
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe O; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

TREADWELL & CO.'S
UPRIGHT SAFETY ENGINES,

2 to 10 Horse Power.

MADE BY THE N. Y. SAFETY STEAM POWER CO.

Has tubular boiler, and therefore is secure against the dangers common to shell boilers. Power is taken from near the base, which avoids vibration or top-heaviness. Occupies but two feet square of floor space and is so simple a boy can run it. All its parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the engine can be detached from the boiler and run independently, if required. Its main points are SIMPLICITY, SAFETY, and ECONOMY. For printing offices, laundries, tanneries, ranches, small repair and machine shops, or for hoisting wherever a small and safe power is red, they are peculiarly adapted.

Refer to the following parties who have them in use

E. DETTRICH & CO., Bag Factory, San Francisco;
PACIFIC CHEMICAL WORKS, San Francisco;
ST. IGNATIUS COLLEGE, San Francisco;
STEAMER "PELICAN;"
STEAMER "COQUILLE;"

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fishar. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rica's, Macey's and Hoskin's patents.

I Guarantss Full Indsmnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machina that will give satisfaction, and do not want to p y for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity puiverizing and amaigamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient avidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsratss as Follows:

The pan being filled, the motion of the mulier forces tha pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into tha quicksilver. The curvad plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a ragular flow between the grinding surfaces and into the quicksilver, until tha ore is redneed to an impalpable powder, and the metal amalgamated.

Setlars made on tha same principle excel all others They bring the pulp so constantly and perfactly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Milli-men are invited to examine these pans and setlers for themselves, at tha office, 229 Fremont Street, San Francisco.

Morris' Settler and Amalgamator.

PATENTED MARCH 25, 1873.

An important improvement in milling. Cheap, light, efficiant and durable. Gains Quicksilver on working tailings. Is discharged from the surface in the center instead of the side, by means of a Syphon which extends to near the center of the Settler. Heaviest casting weighs only 135 pounds. The sides and bottom of the Settler are made of wood, as also Mullers, placed vertically—the friction of which brightens the quicksilver.

One of these machines is in daily operation at No. 616 Merchant street, (basement), San Francisco, Parties desiring information as to rights of use, purchase, etc., can address, FREDERICK MORRIS,

VOLUME XXIX Number 2.

Improved Water-Wheel and Pressure Regulator.

The accompanying illuetration represents an improvement in water-wheels and pressare regulators, recently patented by J. E. Le Blanc, of Gold Hill, Nevada, throngh the patent agency conaected with this office. The improvement cousists in eo coastracting and moanting a water-wheel, and connecting it with the water-reservoir from which the water-preesure is obtained, that the same hydroetatic presenre can he maintained when the flow of water which snpplies the reservoir is rednced as when it ie abnadant, thns obtaining a greater per cent. of power from tbe water than if the water-preesure were allowed to run down proportionately with the decrease of flow.

By referring to the engraving the details will he understood. Let *A* repreeent the reservoir or water-pit, in which the stream of water which furniehea tbe water-power is directed, in order to provide the reqnired hydroetatic pressnre. A tnhe or tunnel, *B*, is made through the lower part of this reeervoir, so that the water in the reservoir will entirely enrronad the tube with an eqaal presanre at all pointa. Connecting with the reservoir at variona pointa around this tabs or tunnel are fonr or more pipea or tubee, *C C*, the opposite onds of which are snpporrted by an upright plate or enpport, *D*, the tuhes being arranged in a circle around the tunnel, and snpported likewise in the plate, *D*. Each alternate tuhe, *C*, is provided with a cock, *E*; or, if preferred, each tube may he provided with one, as moat convenient, eo that the water from all or a portion of the tuhee may be cut off at will. The water-wheel ie eecnred tn a shaft, *G*, the shaft passing through an opening in the plate or aapport, *D*, and throngh the center nf the tube or tannel, *B*, ita ends bearing in enitable supporta.

Tbe water-wheel will thus be eecured vertically close np against the plate or enpport, *D*, as shown.

The wheel naed consists of a solid ceutral portion or hab, *f*, the onter rim of which is made conical or heveliug, the largest diameter heing next to the plate, *D*. To thie beveled periphery ia secnred a eeries of radiating hucketa or wings, *g*, which stand obliquely in one direction to the shaft npon which the wheel is secnred. The outer ends of these buckets are made beveling in an opposite direction to the bevel of the hnb, *f*, and an ontside rim, *h*, is aecnred arnund them. The hnh or central portion, *f*, of the wheel is jnst large enough to bring the ende of the tnbea, c c c, directly opposite the opening on the narrow side of tbe buckete, sn that when the reservoir ia filled and the water issues through tho tuhe, *C*, the streama will atrike the angular bnckete and drive the wheel. Thia conatrnotinn of water-wbeel is very economical, aa the preesnre of the water is exerted with great efficiency npon the series of hucketa, and at the outer rim of the wheel.

Now, aa long as the quantity of water from which the power ia derived ia ahnndant, all of the cocks, *E*, may he left open, and the full force of the several streams he directed upon the wheel; bnt when the supply of water ie reduoed, eo that when all the cocke are opened the reeervoir will not he full, one or more of the cncke can he closed, thus ehutting off a qnantity from the wheel, and causing it to rise in the reservoir until the full pressure is obtained. By thia meane an equal hydrostatic preeaare can be maintaiaed in the reservoir, which will give a larger per cent. of power thau if the level of the water were allowed to rnn down with a full bead npon the wheel.

The wbeel can he caaed in, if deaired. It can he operated either vertically or horizontally, as moet convenient, ae will he readily eeen by any nne conveeant with water-wheels, and numerous devicea can be employed for redncing the delivery of the water upon the wheel, in order to maintain the level and presenre in the reaervoir.

Steam or compreeeed air can he employed in tbe eame manner, hy connecting a pipe with a reaervoir, *A*, through which the eteam or air is delivered upon the wheel. Further information concerning this invention can he pnrcured hy addreseing the inventor as ahove.

Giant Powder for Fishing.

We all know that giant powder has heen ueed in our rivere and lakes for killing fish, and that there is now a law agaiust it, hut ite use for deep sea fishing is somewhat novel. Mr. A. W. Chaee, of the U.S. Coast Survey, daring the winter of 1873 made eome experiments off the island of Santa Cataliua with giant powder, which have some points of intereet. They were not nndertaken at firet as offeriag any field of research, bnt for the more ntilitarian purpnse nf obtaining fish for "chowder."

At the last meeting of the California Academy af Sciences Mr. Chase read a ehort paper on the subject, in which he communicated enme interesting facts. He was much strnck with the variety and number of fish procured, and also with some curious facte connected with the euspension of animation in the nerve centere of the fish etnnned. He says: I have found that the ordinary waterproof fase will burn ahont one foot to every twenty-five aeconds, and hy experiment that a cartridge will explode in from four to aix fathome with from three to four inchea of fuee. I have, however, made no exact experiment ou tbe subject. The shock nf the explosion is most severely felt downwards, as the resistance is greater; and the different varieties of sea fish found near the rocky ahoree of the ielanda as a rule heing fonnd on or near the hottom, it ie desirable to explnde your cartridge about midway between the eurface of the water and the rocka heneath, aa you thus reach both the deeplying fish and thoee, like mackerel and smelt, which swim hetween.

The modue operandi adopted hy Mr. Chase was to take a small akiff and row out tn the kelp beds surrounding the island. Here in eix or eight fathoma of water, the hottom is diatinctly visible. When an unusually large schonl of fish would swim hy, I would quietly light the fuse and drop the cartridge into the water gently. If the water wae eay eight fathome deep I wonld graduate the fuse fnr explosion at fonr. The cartridge would alowly aink—generally in a apiral—and a few bubhlee of air or smoke arise to the anrface.

The fish did not seem, as a general rule, to he mnch alarmed. (Once I remember a large red fish took the cartridge for something gond to eat, and reached it just in time to allow a small portion of bia tail to reach the earface.) When the fire reached the fulminate of mercary, there wnuld be a audden white flash, then a quick sharp detonation, the hlow striking the bottom of the skiff as if some one had struck it with a hammer.

Then in a epace of time varying from eight to ten minutes, every fish within a radius of 40 to 50 yards wonld slowly come tn the surface. Thoee within the immediate vicinity of the explosion, of courae, were killed hy hnrsting the hadder and injury to the large intestiues, and had to be epeared up from the hottom. Those, bowever, at a greater distance, wonld be eimply etunned, and could be taken iu witb a net. Care had to be taken to avoid touching thoae only elightly stunned until the net wae fairly aroaad them, as the slighteet blow would aroaae them from their torpor.

I am now ahont to relate what will, perhaps, he called a gennine "fieh story;" but ae I have, in addition to my own, the testimony of my men to the fact, I give it as it occurred:

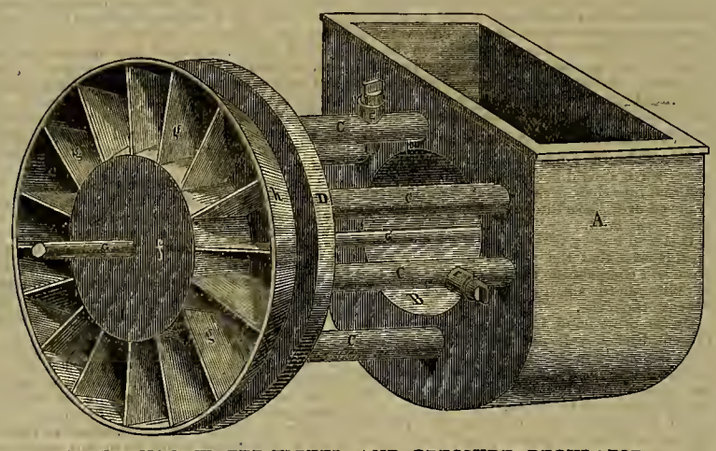
I had brought np by an explosiou a uumher of yellow base fish, weighing abont four pounds each. These are delicious in chnwder, and so instead of pntting them in alcohol I had them cleaneed, which wae done hy scaling, removing the intestines, end cutting off the fine and tail. The head, however, still remained joined to the back hone. These fish from the time they hed been taken from the water up to the time of cleaning remained apparently lifeless. Nor did the removal of the inteetinea arouse them. They were then taken up to the old barracks, where I wae temporarily camped, and hung upon nails driven in the clapboarde. Some little time after they had been thus diepoeed of, one of the men came in and asked me to go ont to look at the fish. I did ao, and found every individual bass elapping around in as lively a manner as if he had heen freshly caught and hung up.

They had, in fact, recovered from the explnaion, and proceeded to die in the common fashion. I took one down and hroke the backhone where it joined the head.

Ite struggles ceased inetantly, thus showing that the vital force had heen arrested in the nerve centera and brain at the time of explosion, and when the effect had passed away that the fiah had resumed a galvanic life.

It wae probahly ahout half an hour from the time of explosion when tbia occurrence took place. I have not heen able aince, however, to secure the same result, although I must state that the only time since then that I have tried the experiment waa on the Oregon coast, where I brought np a school of salmon, all of which were pickled for Agaesiz. These fish were, however, too cloee to the explosion, as they were killed outright.

Mr. Chase found that an nrdinary aized redfish, weighing eay five or eix pounds, which happened to be ten or twelve yards from the explosion, would remain thoroughly stunned ahout twenty-five or thirty minutes; then, reviving, wnuld die from asphyxia, in a aimilar manner ae if caught with hook and line. He procured many curione varieties of the emaller fish auch aa are eeldom caught, as they will not take bait. The hrilliant red mullet, for inetance, will not tonch bait, and livea in hollowa in tbe rocks or around the kelp, where uets could not he dragged. This fish is far baudeemer than the gold fish for our aqaariums. Mr. Chaee thinks that hy this eimple expedient many valuable specimene for the naturalist may he taken from the sea.



LE BLANC'S WATER-WHEEL AND PRESSURE REGULATOR.

MINING activity prevails in Amadnr county.

Academy of Sciences.

The regalar semi-montbly meeting of the Califoraia Academy of Sciences was held on Monday evening last, President Davidsoa in the chair. Wm. B. May and C. H. Wakelee were elected rssident members. Donations to the cabinet were announced as follows: Ore from the Little Giant mine, San Jaan, Colorado. The dark line in the epecimens is said to yield $20,000 per ton. Also, specimens of argentiferone galena and of silver aseociated witb heavy spar. T. J. Butler, of Reddiug, preseated a epecimen of what he supposes to be *kaolin*, from the banks of Pitt river, Shaeta connty; a piece of lava from the etronghold of Captain Jack; also, specimeue of copper, coal and iron from the same region. G. W. Harford presented a pair of slippere used by the fiehermen of the Japanese island, Strick.

H. Edwarde presented numernne natural history specimens, principally entomological. A number of pamphlete aud hooke were presented to the library.

The President donated a seriee of photographe of the hieroglyphic inscriptioas on wooden blocks, at Easter island. He alao read a letter from Mr. Croft, giving all the information within his knowledge of the origin of the inscriptions. It will be remembered that some time eince Mr. Croft wrote from Papeite, giving an accouut of certain blocks of wood upon wbich strange hieroglyphics were carved. He endeavored by every meana to get a translatiou of aome of these characters, hut he found it exceedingly difficult. At laat he found a native nf Eaeter island, who said he could translate the hieroglyphice, and promised to do eo. When this man wae examined, however, he failed tn translate them satisfactorily, giving at different times three differeut renditiona of the eame paesege.

A paper hy Henry Edwarda waa received, heing the fifth of a eeriea on "Pacific Coaet Lepidoptera." The President read a memorial hy Henry Edwarde on George Robert Crotch, the naturaliet, lately deceaeed. Mr. Crotch, during a short visit to thie coast, added aome 200 or 300 specimens to the local collectiona. Mr. Edwarde remarked of him that he was an ahle natnraliet, a true and generous friend, and an accomplished and genial gentlemaa. His death was due to consumption, whicb had been hastened hy his persisting in working in the room of comparative zoology at Cambridge, without fire, thus bringing on a cold whicb settled on his lungs.

Mr. A. W. Chase, of the United States Coast Survey, read a paper on the use of Giant Powder, for nhtaining specimene of fish at sea, detailing experiments made by him at Catalina ieland.

Professor Davideon annonnced that at a futnre meeting he could communicate in detail the reeults of the sonnding expedition to Japan from San Diego. Cnmmander Belknap has forwarded to him all the informatioa necessary.

The President atated that George H. Munford haa telegraphed to him, etating that he ia making arrangementa by which he hnpee to he ahle to accede to the requeat to transmit musical aounde from the office in New York to the rooms in the academy.

Professor Davidson communicated tn the academy aome of the results obtained in ascertaining altitudes by leveling, vertical angles and harometric measures. The experiments were conducted hy himself and Charles A. Schott, of the Coast Survey, and they laeted seven days. The altitude of Ross Mount was ascertained from Bodega Head, hy the process known as double zenith distancee, to he 598.74 metres; hy leveling, 598.53 metres; and by harometer, 598.80. The barometer used was the Smitheonian. It wae found over the whole series of ohservatione that sèven o'clock in the morning was the best time to use the barometer. At one o'clock in the afternoon the difference noted in the barometer, on the average, amounted to 37 feet. The heat radiated from the earth did nnt appear to affect the atmosphere on the line of eight between the Head and Ross Mount, the air heing almost constant in its temperature. Close to the grouud, however, the temperature changed considerably. In this respect, varying results might he expected in other localities.

CORRESPONDENCE.

How our Swamp Land may be Reclaimed.

[Written for the PRESS.]

The Comparative Value.

Land of a similar nature and of equal productive capacity to the overflowed land of California sells readily in Holland and North Germany for from two hundred to eight hundred dollars per acre; in California it sells for less than one twentieth that amount, notwithstanding the greater difficulty of reclamation and of keeping in repair the works of reclamation, and the storms and rains which may come suddenly and with disastrous effect at any time and in any month of the year, in these European countries.

In the brief space allowed the writer in your journal it is impossible to give a satisfactory description of his observations upon the Delta of the Nile and the low lands of the Enropean contiuent; and as your readers are probably acquainted with the characteristics of these countries, it becomes unuecessary. But that many persons in California do not seem familiar with the proper manner of reclaiming overflowed land, is obvious from the abortive efforts they have made in that direction.

The Difference befween Tidal Overflow and the Overflow from Rivers.

It is very proper to make a distinction in the manner of enclosing land by dykes, when such land is subject only to tidal overflow, which may be for one, two or three hours twice a day, and with a drainage of several hours between each tide; for with such land the system of reclamation now adopted may give satisfactory results.

Very different must be the character of the dykes enclosing land subject at any time to an overflow which may continue for one or more weeks; for in the tide overflowe drainage is effected twice a day, bnt in the overflow from the rivers, drainage can only be effected when the water falls below the lower level of the overflowed land.

There will probably be no serious damage ever resulting to either stock or crops upon land in Suisun bay, below Sherman Island, or upon the marsh land of the bay of San Francisco from defective levee.

On the other hand, the high watsrs in the rivers of California have this year clearly demonstrated how thoroughly improper has been the mode of dyking adopted in many places on the margins of these rivers.

Turf Levees Peculiar to California.

Ontside of California the world does not present the picture of sane men being engaged in building levees of turf that will burn by fire, or float away by water. No bears ever worked so effectively in the stock market to depreciate values as the present owners of overflowed land have to render valueless their own lands.

The amount of mouey expended already by several parties in leveeing with turf levees and in planting of seed, would, if wisely used, have given a permanent protection to their lands and crops, and they would not now have to contemplate grain almost ready for the sickle and hearing sixty bushels to the acre perishing because of a foot of water being over the land.

Subterranean Channels Under the Levees.

It is rare to find any laud bordering water courses that will not have subterranean channels or cracks extending for some distance in the land. Old logs, dscaying roots, often afford conduits for water; sometimes a subterranean drainage may have formed a channel, or the surface vegetation may have bridged over a crack, a heaver cut, or a small water course.

What is known as *float* land ie found in Holland, Egypt and, perhaps, among all large bodies of overflowed lands. It is in most cases formed by aquatic plants taking root in land several feet below the surface, and sending to the surface their dense vegetation. Upon this dense surface vegetation, sufficient earth accumulates to sustain additional vegetation, and when this rscsives the deposit of the rivers sufficient to close the light from the subaqueous plants, they perish, and thus the hond between the float and the lower land becomee severed. With a great probability that the dense sod on the margin of the river has bridged over some cracks, roots, logs or water chanuels, is it wise to expeot a levee will protect your land when built over such conduits?

The first rule laid down by continental engineers is to dig a narrow, deep ditch and fill it well in with good earth, and no levee is ever built in those countries without these precautions. Upon thia ditch the center of the levee rests.

The Necessity of Trenching before Leveeing.

Grand Island is the most successful reclamation among the islands of the interior of the State. Ite levee is of pure sediment, with neither sod or turf except a cross levee at tho lower part of the island. This cross levee is defective because it ia composed of turfy material, and because there are subterranean ohannels beneath this levee.

Upon this island they have found it necessary during the high water, in many places, to dig ditches bsneath the inside of or undsr the levee, and fill them up with compact earth, and thus cut off the subterranean water chanuels. The experience of Grand Island confirms the importance of the first directions of the European engineers to "cut off your subterranean channels."

Levees Should be from Material Taken from the Bed of the River.

Nearly all the lands overflowed by the San Joaqnin are compoaed of a light, turfy material which will float or burn. The value of this land is very great, as its productive capacity is not excelled by any in the world. The attempt to guard this land from overflow with levees composed of the material found on the spot has this year resulted in a failure. The proposition to take the turf nearer the edge of the bank to cover over the present levees will result in a greater failure. First, because there is not enough of pure sediment unmixed with vegetable matter to make a permanent levee, and its weight will tend to elevate the ditches. Second, the experience on Sherman Island has been, that cutting outside of turfy land tends to open subtsrranean conduits for water and to furnish starting points for fissures.

There is no material suitable for levees on the larger portion of the low lands of the San Joaquin river, unless that material is taken from the bottom of the river or slonghs.

Dredging, nof Ditching, Machines Required.

Had the money and genius which has been expended in the creation of ditching machines been employed in building old-fashioned dredging machines, and had suoh machines been used in raising the bottoma of the rivers to make levees upon the land, then the reclamation of such land would have become a success.

Upon the Isthmus of Suez a large number of dredging machines were nsed, being more economical than the labor of fellahs, whose wages were much lsss than the wages we pay Chinamen. Those machines dug to the depth of 26 feet, and with their many buckets carried the dirt to ench a hight that through sluices they cast it 200 or more feet from them on the land or in dump carts. In Holland they have many dredging machines digging out lakes and rivers, elevating the earth to a proper hight and casting it on land, thus forming levees.

As before stated, a small ditch is dug, into this ditch good earth is well stamped, and upon this the levee is constructed of earth, free of decomposing vegetable matter. The value of money in California has prompted men to disregard the experience of centuries in older oountries. A few more failures and we will find that by borrowing the experience of such countries we would have saved money.

The Foundation of Levees should be in Ditches.

To reclaim the land of the San Joaquin river, heavy earth should be taken from the rivers and cast into their present ditches until a levee is raised over these ditches sufficiently high to protect the land.

It is well known that so tenacious is tbe turf on this river that the weight of no ordinary levee will compact the earth beneath, sufficient to obliterate the small channels which may be beneath the levee.

On the other hand, heavy earth cast into the present ditches will not have the resistance from the cohesion of the surface sod, bnt it will tend to bring the float land to its bearing, and close all communication between the outside and inside of the levee.

The objection urged to using the present ditches as a base for levees is that the amount of earth required will be too great, and that it can not be afforded at present.

To this we may reply that earth may be cast upon the land from the bottom of the rivers for about five cents per cubic yard, by the many bncketed dredging mschines; whereas, the cutting of turf by Chinamen costs 10 cents. Further, it may be stated that overflowed land is valuable in proportion to the security to stock, crops and improvements. Land feebly leveed briugs fear to settlers upon such land, and they hesitate long before they venture either to improve or cultivate, and they do neither as well as if they were acting upon a certainty. In Holland they reclaim land submerged, as the land in the bottom of the bay of San Francisco; but they reclaim such land in a manner to give them confidence; they then build towns of brick, 18 feet below the surface of the water they have excluded.

There is uo body of land of greater productive capacity to be found on this earth than the land bordering on the rivers of California; and yet, to save these lands from an overflow of three or four feet, which may come every three or four years, money is dealt out so sparingly as to render their so-called reclamation a *fraud* and a *deceit*.

To doubt the practicability of successfully and certainly reclaiming these lands, is to refnse to accept that which has heen demonstrated for ages in other countries.

Chcaper fo Reclaim by Levees than Pay Tribufe to Railroads.

The interest of the money expended in reclaiming swamp lands is, as a general proposition, lesa than the amount paid to railroad companies by the owners of upland; for the swamp lands are accessible to sail vessels which will take the producta of the soil to market for about one dollar per ton; whereas the average paid by farmers in the winter may be *three* or more dollars. An acre in the great valleys of this State which producea two tons of marketable produce, paya the interest on $40 for the transportation of that produce more than a similar acre of lowland does. If there is reason in this ststsment, surely the owner of lowland should not refuse to expend, if necessary, as much as $10 or $15 per acre to reclaim with certainty land that will produce double as much as the most favored upland.

By a latitude of expression we may say that upland in the interior is reclaimed and made available by railroads, to which they pay tribute to the extent of the interest on from $20 to $60, according to distance and the productions of each acre. The difference of cost of transportation is more than the interest on the cost of the most expensive reclamation which may be required on the most exposed swamp laud.

If a company were guaranteed the privilege of transporting the products of the now submerged lands for a period of years at prioss charged by the roads of the Sacramento and San Joaquin valleys, they could, with great profit to themselves, build all the levees required and present them without cost to the owners of the land.

W. M. RYER.

Foreign Corporations and American Mines.

EDITORS PRESS:—In view of the possibility of the bill introduced by Mr. Pratt, providing for the compulsory patenting of all mining claims which have produced $5,000 or upwards, though at present indefinitsly postponed, passing into law, I may be excused if, as manager here of several English companies, I attempt to direct your attention to the anomalous position occupied by foreign corporations in this matter of patents—a positiou which will be rendered still more anomalous should the bill referred to receive the sanction of the legislature.

I must not be supposed to object to the bill itself; on the contrary, I think it should pass; but not before the way has been paved for it by an important emendatiou of the act kuowu as "The Mining Act of 1872."

To make myself intelligible to the general reader, it will be necessary to go back to the year 1866. Up to that time, digging for minerals on the public domaiu—no matter by whom—was a trespass; and, as such, punishable. On the 26th July, of that year, an Act was passed by Congress, section 1st of which provides "That all the mineral lands of the United States, surveyed and unsurveyed, are laid open to all citizens of the United States, and to those who have declared their intsntion to become such, subject to statutory regulations, and also to the local customs and rules of the miners in the several mining districts not in conflict with the laws of the United States.

This license to search for minerals, and the right of possession acoruing thereon, is all that has been recognized by the legislature in the way of title, until the fee simple should be acquired by ths purchase of the solum; but this title, such as it is, has always had the protection of the law, if properly acquired, and subsequently maintained by custom-work, and could be transferred to, and held by an alien on the same conditions.

The mining act of May 10th, 1872, while prescribing the mode of procedure necessary to convert this possessory right into a fee simple title, carefully preserves and even enlarges rights previously acquired. "Provided," says Section 16, "that nothing contained in this act shall be coustrued to impart in any way rights or interests in mining property acquired under existing laws."

But, unfortunately, and although section 7 makes it lawful to convey a patent "to any psrson whatsoever," no foreigner or foreign corporation, however faithfnlly he or they may bave complied with all the laws regulating his tenure, or however valuable his claim, can procure, by direct application, this indispensable safeguard to the security of his title. See sections 1 and 7.

This, however, is the etate of the law as it stande at present. If I can show that this condition of things not only entails a gross hardship on the alien, but a positive pecuniary loss, capable of correct estimation in dollars and cents, on the people of the United States, I shall have gone far to have secured your advocacy, to have furnished you with a potent argument with which to press for an early reviaion of the statute, not more in the interest of the alien than of the Amerian citizen.

As the law now stands, the government loses five dollars an acre for every acre of mineral land held by a foreigner, for they can't take his money without giving him a patent, and they can't take his mines from him and sell to a citizsn, for his rights are specially protected by Section 16; unless, indeed, the foreigner choose to resort to a subterfuge, born of the exigencies of the position, and divest himself of his property in favor of a friendly citizen, who obtains the patent and re-conveys.

Many foreigners would rather cling to the title they have, with all its drawbaoks, than have recourse to what is clearly an underhand evasion of the law. Many, again, are so circumstanced in remote camps and otherwise, as to be beyond the pale of a friendship ao disinterested that he would care to entrust to it interests varying from ten thousand to a million of dollars, for even the period necessary to apply for and procure the patent.

Still it is done; patents as a matter of fact have been obtained by foreigners iu this way; and what I wiah to convey is, that the government of the United States would lose nothing but gain much by conceding to the alien as a matter of right what, in the present state of the law, is really obtainable in an underhand way, though expressly forbidden by it—the right to a patent when he has purchased from an American citizen, and complied with the laws regulating his holding.

I do not mean, and this must not be overlooked in dealing with the question, to claim for the foreigner the right to go on the public domain and locate mines for himself. That ia a privilege very properly reserved to the people of the United States to the exclusion of all others except those who have become citizens; a privilege however which, it eeems to me, would be of more value to the American, were the right of possession acquired by location to carry with it the right to a patent to all purchaeers alike.

It cannot he the intention of the government to prevent the public lands being held by foreigners in fee simple, otherwise the owner of a patent would not have been specially permitted to convey his patent to any person whateoever. A patent in this country carriee with it the same absolute title to the land as a crown charter does in England, not to the grantee only, but to his disponees.

"That aliens are in possession of patente alone and associated with American citizens is a well known fact, and that foreign capital has materially assisted in developing the mineral resources of this conntry cannot be denied. There is no provision in the law to deprive the foreigner of his claim by confiscation, and his title to mining property is not inconsistent with the other lawe of the United States or with the State constitution and laws."

So says Gregory Yale in his standard work on the Mining Laws of California, p 363, written long before the coffers of the old country had poured their gold so profusely into the mining districts of California, Utsh, Colorado and Nevada.

I have myself, during my six years' residence in this county, expended for my English friends ou the development of mines here upwards of $240,000 besides paying for the ground; and now that the mines begiu to show themselves likely to be worthy ths expenditure, wo wish naturally to put our title beyond the resch of attack, by paying the government of the United States the price they demand for the fee, so that what we have made productive we may be allowed peaceably to enjoy.

If Pratt's bill passes, and the aot of 1872 remains unaltered, every foreigner owning a miniug claim which has produced $5,000 would be robbed of it; because, while this bill compels him to apply for a patent, the mining act says he ehall not, and the consequence of noncompliance is forfeiture, forfeiture not of the ground only, but of all that has bseu expended upon it.

True, a foreign purchaser of mines can *now* protect himself by insisting on a patent as a *sine qua non*, but how is it with those who either acquired their land previous to the existence of the act of 1872, or neglected the precaution because unaware of its importance? What of those who bought their claims in good faith from American citizens as far back as 1866, before patents to mines were heard of? What of those, who, relying on the protection of the laws under which they purchased, spent their last dollar and the best part of their lives in making them remunerative; but who, it is alleged, cannot even defend the title that they have—the right of possession and their improvements—by maintaining an adverse claim against an enoroaching patent applicant?

Suppose the unfortunate foreigner, surrounded by Amerioan miners, who are applicants for patents, is he to be curtailed foot by foot, first by one, and then by another, until he is left nothing—nothing, at all events, worth continuing to work—nothing but this "right of possession" which has cost him so much money, so muoh anxiety, and so much time—this, which he has regularly paid his taxes to both county and State to defend—a right of possession to nothing, except, perhaps, a bitter sense of a grievous wroug, a wrong to last him a lifetime?

And yet such is the effect of the present law, uninteutional on the part of your legislators, I am satisfied; but the effect all the same.

Assist me to get it amended; evoke the assistance of such men as Sargent, Jones and others, who have the interests of the miner at heart, be he citizen or alien, and the thing is as good as done. A rider of six lines to the act of the 10th of May will do all that is desired.

Apologizing for the length of my letter, I remain, Sirs, your very obedient servant,

LEWIS CHALMERS.

Exchequer mill, Alpine county, Cal.

INCOMBUSTIBLE PAPER.—This paper, although not regarded as absolutely indestructible by fire, retains its form after passing through such ordinary fires as occur in houses, factories and other buildings, and may therefore be regarded as incombustible. The pulp, which is manufactured in the uanal way, is composed of vegetable fiber, one part; asbestos, two parts; borax, one-tenth part; and alum, two-tenths parts.

CLEOPATRA ORE.—About four tons of ore from the Cleopatra mine, Peavine, are now on tbe railroad platform awaiting transportation to Truckee, where the rock ia to be smelted. We understand the Cleopatra oompany eell their rock for $10 per ton to the Truckee smelting company, who take it from the mine to Peavine and ship it to Truckee at their own expense.—*State Journal.*

Scientific Progress.

Ozone—A New and Correct Method of Supply.

The use of ozone os a disinfectant in hospital wards and public buildiogs has amply demonstrated its virtae as a purifier of air exhausted by breathing or poisoned with emsnations from corrupt or decaying organic matter. The only bar to its more extended use has been the lack of a simple and trustworthy means of generating it, safely and contionously, by a process not involving scientific skill or costly materials.

The latest means suggested certainly bears the palm for simplicity, cheapness, and accessibility to all. It coosists simply in the exposure to atmospheric action of common phosphorus matches moistened by water, the alleged result being the production of nitrite of ammonia and ozone—both active purifiers of air.

Knowiog the efficiency of molstened phosphorous as a generator of ozone, the aothor of the match method, Mr. S. Beer, of New York, set out one day to procore a quantity of that substance to use in sweeteoing the atmosphere of a room whose musty smell had successfully resisted the power of ordinary disinfectants. Failing to find any phosphoras at the drug stores in his neighborhood, it occurred to Mr. Beer that possibly lucifer matches might furnish the needed element in a condition suited to his porpose. He tried them, dipping them into warm water for a few moments, then suspoading them in the obnoxious room. Their effect was prompt and salutary; and tbereafter, hy continuiog their use, he wos able to enjoy "the luxury of pure and refreshing air," notwithstanding the room was in the basement of an old cellarless house on made land, the air of which was further tainted by a quantity of moldy books and papers. In a paper lstely read before the Polytechnic bnoch of the American Iostitute, Mr. Beer narrates a number of subsequent experiments with the same simple materisls, the success of which convinced him that he had made a veritable discovery of great importance.

Touchiag the safety of the method he proposes, Mr. Beer is confident that no overchargiog of the air with ozone or other injurious matter may be apprehended from the use of matches in the manner he deecribes. Both the ozone and the nitrite of ammooia are generated slowly, and their force is swiftly spent hy combination with the impurities tbey are intended to remove. It is obvious that the supply of the purifying agents can be easily rcgulated by increasing or diminishing the oumber of active matches. In the room above meotioned, six bundles of matches were kept active—some near the ceiling, others near the floor—by daily watering.

In another instance a single bunch is meotioned as having sufficed for quickly purifying the oir of a room in which several adults and children were lying sick, hut in this case the air was fanned against the motches while they were carried about the room, tbus hightening their activity. How long a match retains its ozonizing power, Mr. Beer does not say. In conclusion, Mr. Beer claims that, whatever may be ssid of his theory of match action, the fact is indisputable that, in the use of mstches as he suggests, we have a handy, wholeaome and inexpensive means of freeing our housea from noxious exhalationa and the long train of evils attending on the prevalence of bad air. The matter is easily tested and certainly well worth trying.—*Scientific American.*

Audible Safety Lamp.—An ingenious and efficient apparatus for preventing explosions in collieries haa been invented by Mr. Aldis (manager) ond Messrs. Hyde Brothers (engineers), of the Seend Iron Worka. On one side of the flame of an ordinary aafety lamp they affix a amall brass plate, which proteots from the flame a small brass rod, at the upper part of which is a smoll piece of fusible metal. In the presence of a dangerous accumulation of gas the fusible metal melts, detaches a brass rod, and releasea a aliding brasa csse, which falls over the flame and instantly extingoishes it. By the same action thia case falls upon the electric detent, aod an alarm is given throughout the whole workings, even to the pit's mouth, if required. The improved lampa are suspended from the roofa of the different workinga where the gaa would be supposed to accumulate; and the bells communicating with each other, all the bells in the colliery would simultaneously give an alarm upon the presence of a dsngerous quantity of gas. Thua every man in the pit would have ample warniog of danger, and efficient time to secure his property and make his escape.—*London Mining Journal.*

Sound.—In a paper on the duration of the aensation of sound, Prof. Mayer ssid that experiment proved that the residual aensation only occupied one five-hundredth of a second in the case of 40,000 vibrationa per aecond; but in the case of forty vibrations to a second, tbe residuol vibration was one-eleventh of a second. He concludes that the whole ear vibratea as one mass, and the durations of these oscillations of the whole ear are far too short to remain one-thirtieth of a second. He thinks that this explains our inability to distinguish the actual pitch of sound when that pitch exceeds certain well known limits.

Facts and Fancies about Heat.

Our scientific contemporaries, upon whose knowledge we hang as lovingly as the infatuated and blind Capid hangs upon the neck of Venus, will persist in belittling our stupeodous globe by iastituting comparisons of an odious character. Professor Proctor made us feel much smaller than a Liliputian gnat; and now Professor Langley, of tho Alleghany Observatory, cites us as the representative of coal and iron, before his glowing and caloritio majesty, King Sol. The Professor says, in answer to the question, "How hot is the sun?" tbat Sir John Herschell and Father Secchi place it at *at least* 10,000,000 degrees of Fahrenheit, while Sir William Thompson thinks it is something near thirty or forty times as hot as one of our hlssting furnaces, which vaporizes a small portion of the iron it renders, while the aggregate amount of iron which annually passes out of the Pittsburg chimnoys in the vaporized state, may be estimated at 5,000 tons. Tbis would appear to be a great waste, hut when we come to compare it with that of the great furnace of the sun, whose fire-grate area is reckoned not in yards, hut in square miles, of which its surface includes 2,300,000,000,000, is a very small affair. The learned gentleman then proceeds to show that, as a calculation of the exact omount of heat given out from a furnace of known size can essily be made; so, likewise, can we calculate accorately how long a given amount of coal will lsst. Comparing the sun to such a furnace, we ascertain the area; and adopting a probable value for the rate of emission, it becomes a simple problem in practical engioeering to determine how loog a given quantity of coal would last if burned at its surface at the rate of combustion which would just maintain this known heat. A careful computation hascd upon the above hypothesis shows that the entire cosl fields of Pennsylvania would keep up the actusl solar heat *not an entire second*. The amount of fuel required to keep up the everlasting combustion that gives off the heat that even our little globe eojoys is inconceivable.—*Coal and Iron Record.*

The Moon and Vegetation.—A correspondent writes: "It is a popular belief among the mass of farmers that the influence of the moon has sn important bearing upon various young plants as they happen to come forth either in her light, as full moon, etc., or in her wane. This idea is ridiculed and entirely disbelieved by what are called the mcst intelligent and scientific farmers. Is it not a fact that the light of the full moon on a young plant just come forth would have some effect on it, different from tbe darkness which prevails in tbe moon's absence, and do not these tender plants reqoire extra sleep, as an infant does? And in the absence of it, does it not essentially change their cbsracter and production?" When the moon is shining, the clouds are wholly or in a great part absent, and the effect of the absence of clouds becomes very evident wben a thermometer is placed in the focus of o silvered mirror and turned towards the unclouded sky. The thermometer falls with great rapidity, its heat being radiated out into the abysses of space, which are estimated to have a temperature vastly below the zero of our thermometric scale. When a cloud passes between the mirror and the sky, the thermometer rises rapidly, the loss of heat being interrupted. The clouds act like a woolen blanket, preventing the escape of heat. Now whst the thermometer is in this experiment, so in nature is the plant. On a moonlight (cloudless or partly clouded) night, it moy radiate so much heat that injury may arise to its tender organization. The Earl of Rosse'a great teleacope has detected the beat radiated by the moon, hut it is an incredibly minute quantity, and can have no effect on vegetation.—*Scientific American.*

Naphthaline.—A receot Eoglish patent relates to the applicotion of naphthaline. 1. As a substitute for sulphur, wax, resin or other inflammable materiala used for dippiog or impregnating matches and firelightera. 2. As on addition to the phosporus paate in which the eods of wax and other matches are dipped. 3. To increase the inflammability of candles, tapers, links and torchea. 4. For burning in lamps in the form of a hollow candle, provided with an independent wick and douhle air current, the flame serving to melt the solid naphthaline to feed the wick. Naphthaline is a white crystallizable aubstance evolved by the distillation of bituminous coal. When crystallized it is a very delicate film, yielding to the gentlest touch, yet, under favorable circumstances, it compacts and is capable of coosiderable resistaoce. It has a peculiar, faintly aromatic odor, not unlike narcissus; ia heavier than water, and is readily dissolved by naphtha.

Flame.—W. Stein has publiahed a criticism of Frankland's statementa concerning the illuminating power of flames. Frankland, abandoning the old theory of incandescent carbon particles, auggests that the illuminating power of flamea is owing to very oondenaed vapors of hydrocarhons. The author of thia article brings forward a number of known facta in support of the old hypothesia.

Tellurium.—On the aide of a piece of arsenical pyrites, Harmay observed a metallic aubstance between which and the pyrites were a few scalea resembling specular iron, but of a brownish color. The metallic-looking substance proved to be tellnrium, and the intermediate mineral a tellurium sulpharsenate.

Mechanical Progress.

Making Match-Sticks.

The process of outting small, rouud sticks used for mstches is an interesting one, and in writing thia descriptiou we shall eodeavor to make it clear to tbe reader in as simple language as possible. It must be borne in mind that makiag match-sticks is one branch of busioess—applying tbe compositiou another. After the pine logs are redoced to plank, the next operation is to cut them into blocks four and five inches in length, by means of small circular saws. They are then assorted by hoys, preparatory to being fastened to the great wheels, to be cut into match-sticks. Pine slsbs, obtained from the sawmills, to maoufacture blocks, are found to answer the purpose well, as the lomber in them is of the best quality. In thus utilizing the refose lumber there is great soving. Few people have a correct idea how match-sticks are made. In the first place, there is an immense wheel, 20 feet in diameter, with two six-feet faces or breasts, much resembling sn old-fashioned "overshot" waterwheel, on which these blocks are fastened in rows by means of clamps or screws. The machioery is of such a powerful character that the frsme-work on which this ponderous wheel is hung, is composed of heavy oak timhers, 12 by 16 inches, resting on o solid stone foundation, 25 feet by 12, and 5¼ feet deep, laid in cement. The necessity for snch a firm foundstion will he readily seeo, when the reader is informed that tbis wheel makes 21 revolutions in a minute, snd most not vary a hair's breadth in its motion. The face of the wheel being "loaded" with blocks, the process of cutting the sticks is commenced. A rest, similar to an iron lathe, is placed in front of the breast of the wheel, which is moved right or left, on the lathe principle, by means of screws, etc., on wbich a number of small steel cutters, with holes like an eyelet, are fastened. These cutters are adjusted so as to face the blocks, and as the wheel revolves, eoob one cuts a splint out of the wood, and drops it below. There are 16 of these cutters, or punch-like chisels to esch wheel, and the number may be increased to 32, if necessary. The principle upon whicb tbe match-stick is made is the same as that used in olden time for making rake-teeth round, which consisted in driving a piece of wood througb a steel tool, having a hole in it with sharp edges. In this case the large revolving wheel scrves as the propelling power, and forces the faces of the blocks, that are securely fastened to its outer surface, through the smsll steel eyelet-like hole in the eud of tbe tool, and a splint is cut out almost with the rapidity of lightning, and dropped below. The machine is so perfectly adjusted, and works with snch exact minuteness, thst it cuts 100 splints from every solid inch of timber—no more, no less. This fact has heeu demonstrated. The delicate cutting tools ore moved horizontally at right angles with the face of the wheel, by a screw which moves the row of cutters exactly the thickness of a match-stick, from left to right, at each revolution of the large wheel. Each pair of cutters hos a section of blocks to pass through, six, eight to ten inches, as the csse may be, which, when performed, the tender, by the turn of a smsll wheel, brings them back to the stsrting point, sets the cutters by the turn of onother sma l wheel, and they start again across the breast of the large wheel. Aa the rouod splints are cut out of the face of the block, it assumea o corrugated appearance, not unlike the face of an ordinary washboard, and when the machine starts on the next cut, the projections, forming one-half of the splint, are cut out, thus alternating the corrugations. The two machines thus in operation will cut 24 gross of aticks (7,200 to the gross), per minute, with 16 cutters to each, or, in the oggregate, 172,800 per minute, 10,368,000 per hour, or 103,680,000 per day of 10 houra.

[To be continued.]

Metallic Floors.—A method has been devised for renderiog floors in good degree fireproof, by employiug long, flat bars of tbin sheet metal, with a perpendicnlor flange turned on each edge. Other long, thin bars, which are curved or arched, aod riveted at or near the edges to the first-named strips, are placed edgewise vertically, one between each two, the connection being so arranged that the tops of the arches do not riae quite as high as the tops of the first aet of bars. Narrower atripa are also arranged across and riveted to the lower flaogea at anitable intervals apart, to serve as lath to hold the ceiling plaster to be applied to them, aa well as to brace them laterally. Similar strips are arranged across and riveted to the upper flanges, or wood pieces may be bolted on to receive and support the floor boarda. The outside flangea are built into and rest in the wall, and other flanges may be applied, if desired, to the outside strip for letting into the wall. For a floor of great length the bars are lapped and riveted.—*American Manufacturer.*

Private trials of a new steamhoat for use on the canals are now engrossing the attention of several eminent engineers. In this boat the old paddle-wheel and the screw are discarded, and a new method of propulsion ia used, in which the loss of power is reduced (it is said) to a minimum.

Fish Scale Ornaments.

Amoog recent patents is that of E. aod J. Heubner, of Newark, who have invented certain new and usefal improvements in preparing fish scales for use in the arts, of which the following is a specification:

The object of the iuvention is to atilize the scales of several varieties of fish, hitherto thrown away as useless, and prepare them for application in the arts, by producing articles of jewelry, artificial flowers, and similsr objects. This invention coosists in the process of cleansing and purifying the scales, till the clear, horny substance or core of the ssme is obtained, which produces a new article of manufacture, which may be stamped into various orosmental shapes, aud dyed in all colors, for use in the arts.

Large scales are tbe most advantageous, taken from fresh fish. Old scales cannot be used, as they lack elasticity and clesrness. The fresh scales are exposed for twenty-four bours to the action of pure salt water, for looseoing aod partly separating the outer layers of organic matter. They are then transferred to distilled water, being plsced every two or three hours in clean water, and washed therein five or six times, which renders the scales soft and olear. Each scale is then carefully rubbed with clean lioen rags, then passed throogh a press hoving a linen lining, so as to remove tbe moisture in the scales. The scales are finally plsced for ooe hour in alcohol, and again rubbed and pressed, when they are dry and have a perfectly clear appearonce, a mother-of-pearl-like hne, and great elasticity and durability.

Tbe scales are used in this prepared etate, or they may be dyed with auiline and other colors, in the usual manner, to be stamped into various kinds of ornamental shspes, leaves and flowers, snd applied to the manufacture of jewelry and artificisl flowers, for embroidering and inlaying wood, and other uses in the arts.

Steel Boilers.

The assertion is made by the engineer of the Austrian state railway compaoy, Mr. Haswell, that, in order to obtain steel hoilers onswering all requirements, only correspondingly thick plates, and plates of the best moterial, witbout any addition—for otherwise the steel is not homogeoous—ought to he used; and they ought to be scrupulously assorted according to the texture and the tensile strength. After boring or punching tbey should be carefully annealed, the riveting must be formed with great particularity, and the bending only with wooden hsmmers.

That steel plates msnufactured in Austria are of excellent quality, Mr. Haswell says, is proven by the monner in which boilers are there constructed; the box-front plate, down cover, and the sides of the tubes are only furnished with sn edge or border, while in Eoglsnd they are compelled to use angle iron for these connections.

Mr. Haswell is one of those who regard steel plates as preferable to iron plates, owing to tbe fact that they possess the ssme degree of elasticity in all directions—from twelve to fifteen per cent.; in iron plates, however, it is in the direction of the fihers, and about 15 per cent., but in a cross direction only five per cent. If ooe proceeds in the right manner, says Hsswell, steel plates may be used with perfect safety. The hoiler manufacturer has the advantsge that he finds less plates to throw aside, and the railways will have more carefully constructed, strooger, and, in the end, cheaper boilers.

Lacquer.—It haa been generally aopposed that the beauty of Japan lacquer work was dne to ingredients derived from unknown plants, and that the aecret was confined to the Oriental workmen. Recently, however, in Holland, objects of art have been produced, lacquered and covered with mother-of-pearl, in pieces *fac similes* of those made in Japan. The lacquer used is prepared from the hardest varieties of gum copal, principally that of Zanzihar, which ia colored black with India ink. The articles are covered with several layers of thia substance, upon which, while still wet, or rather pasty, the mother-of-pearl is inlaid. Dryiog in a furnace follows, another coat of lacquer is applied, then more drying and smoothing with pounce. These operations are repeated until the aurfaces are perfectly united and smooth, when a final polish is given with tripoli.—*The Engineer.*

Coating Metals.—An invention has been patented, the object of which ia to coat metal plates without immersing them in o bath, or otherwise requiring a large quantity of the coating metal to he kept in a molten state. Rollers are employed to apply the coatiog metal to the surface of the plate, and the molten coating metal is supplied little by little to the rollers aa it is required. In a similar way flux is applied to the plates, and the use of batha of flux is avoided.

Penholders.—A new method of making metallic penholders consists in making tbe barrel part and the internal tube or binder from one piece of sheet metal. A blank of a T shape, or provided at ita head with wing pieces, is cut from sheet metal, and the said wing piecea by a series of processes are folded flat or nearly so upon the blank. The blank is next raised into a trough form and afterwards into a cylindrical form. The barrel part and internal tube or hinder are tbus made from one piece of metal.

Mining Stocks.

Stocks are very quiet, there being very little business doiug eitber in tbe Board or on the street. Fluctuations have not been large either one way or the other. Iu speaking nf the state of affairs on the Comstock, the *Enterprise* of Satnrday ssys: Altbough we are hsving no sudden or startling strikes, good developments are being msde in not a few of our mines, and these are likely to gradually expand into something permanent. In the case of the Consolidated Virginia there never was any grand, startling strike. From small streaks and bunches of ore tbe vein wss followed until these led to deposits which now make the mine the finest on the lead. The Opbir Co. are now progressing in tbe same way, and tbe indications are, that tbe Hale & Norooross and the Imperial-Empire are traveling in the same direction.

Variations in price in prominent stocks bave been as follows: Belcber, between $83 and $86; Best and Belcber, $25 and $26; Bacon, $3.75 and $5; Caledonia, $18 and $19.75: Chollar, $69 and $72; Confidence, $11.50 and $13.25; Cons. Virginia, $82 and $82 50; Crown Point, $81.50 and $82.50; Excbequer, $60 and $66; Gould & Curry, $22 and $23; Hale & Norcross, $48 nnd $54; Overman, $32.50 and $36; Savage, $83.50 and $90; Trencb, $7 and $9; Yellow Jacket, $89 and $91; Empire, (Idaho,) $5.25 nnd $6.50; Golden Chariot, $7.25 and $10.50.

Arizona Mineral Lands.—Tbe Tucson *Citizen* is complaining tbat some of tbe most valuable lands in the Territory are reserved to the Indians, and says in its issue of June 27th: Tbe large areas covered by the Chiricahua and White Mountain Indian reservations are even now retarding enterprise. Especially is tbis true with reference to the White Mountain reservation wherein it covers the copper mines about Clifton. It is expected at Washington that Agent Roberts will recommend tbe reduction as requested by the miners, so tbat tbe department can make it with tbe approval of all the officers wbo are in a position to know that the Indians bave no use for, and hardly any knowledge of, the mining lands sought to he excluded.

Eureka Bullion.—Following are the shipments of bullion made by the different companies of Enreka for the month of June: Richmond, 1,000,000 pounds; Eureka Consolidated, 879,420; Ruby Consolidated, 533,527; Hoosac, 360,707. A total amount of 2,793,744 pounds shipped, besides whicb there are nearly 500,000 pounds produced not yet delivered.

Sale.—The Jefferson mining company, Jefferson cañon, Nye county, Nevada, bave sold two-thirds of tbe Prnssian Soutb and Jefferson mines to a party in San Francisco for the sum of $75,000 gold coin, one-third being retained by tbe former owners—Stephen Roberts and George R. Williams.

The Bellevue mining company, Placer county, sbipped last week a bar valued at $5,400, the result of a ten days' run.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

Edith Quicksilver Mining Co.—June 2. Location: Sonoma county. Directors: Morris Jacobson, Chas. A. Bacon, Henry P. Bowie, Chas. A. Lowe and David A. Jenning. Capital stock, $400,000.

International Gold Mining Co.—July 6. Location: Greenwood District, El Dorado Co. Directors: T. G. Bilty, Vincent Antonelli, Joseph Muriatha, J. M. Buffington and Geo. H. Hallett. Capital stock, $1,400,000.

Meetings and Elections.

California Iron and Smelting Co.—Meeting held at Sacramento on the 6th inst. Directors: N. Greene Curtis, F. Mier, I. B. Potter, M. J. Smith and J. M. Avery. The Directors subsequently elected N. Greene Curtis as Chairman, J. M. Avery as Secretary, F. Mier as Treasurer, and I. B. Potter as Superintendent.

California Pioneers.—The annual election of this association was held on the 7th inst., with the following result: President, James Lick; Vice-Presidents, David J. Staples, of San Francisco; Frederick F. Low, of San Francisco; Edgar Mills, of Sacramento; F. A. Hihn, of Santa Cruz; A. K. P. Harmon, of Alameda; Secretary, Louis R. Lull; Treasurer, Howard Havens; Marshal, William Huefner; Directors: Charles H. Chamberlain, Henry Schmeidell, David N. Hawley, Thos. D. Mathewson, John F. Pope, Charles R. Peters, John H. Turney, John A. Drinkhouse.

Correction.

Editors Press:—In speaking of the economy of quicksilver recently, I stated that the means of preventing tbe large loss nsually experienced in processes of the patio class, were "appsrently not understood" in Mack's mill.

Mr. Julius Psrtz, metallnrgist in that establishment, feels somewhat nggrieved by this, and informs me that he has long been aware of tbe proper method, but was prevented from carrying it out by circumstances beyond his control.

Why, under these circnmstances, tbe proprietor has allowed the waste to go on for a year and a hslf, it is not my business to inquire; but my object in making the statement was not to disparage Mr. Partz but to remove the impression thst so large a loss as Mr. Mack has stated to occur, is unavoidable, as I was aware that the matter bad been msde a subject of discussion between that gentleman and some metallurgists in San Francisco. As the contriver and promoter of the process used, I was natnrally desirous of having it understood tbat nn unduly large loss is not a necessary concomitant, nor is tbe heavy expense in otber respects in tbat mill to be taken as a criterion, being largely due to defects in the construction and arrangement of the mill, which defects, however, can be easily remedied, and in regard to whicb tbe builders were warned in vain.

C. H. Aaron.

Benton, June 29th, 1874.

White Pine.—Tbe people of White Pine are very hopeful that tbe old camp will make another prosperous start before long. The mines of Treasure Hill are all looking well, and tbe people of that section are anticipating a speedy change for tbe better.

Ditches in Montana.—A Helena, Montana, paper says that over $100,000 have been invested in the construction of new ditches in that Territory this year, but the supply of water will be very short, unless abundant showers of rain set in.

Reports from tbe cinnabar mines in Santa Barbara county are of tbe most favorable character. Notices of the location of claims in the Santa Cruz mining district, adjoining Santa Inez mining district, in this county, have been filed in the County Clerk's office.

Chrome Ore.—There are six hnndred tons of chrome iron ore from the mines at Cloverdale lying at McNear's wharf, Petslnma. It will be shipped to San Francisco next week, and from thence to New York in the ship *General McClellan*.

Butte Flume.—Work on the Butte Flume and Lumber company's new finme is progressing at the rate of 1,100 or 1,200 feet per day. It is now complete a distance of about thirty miles, leaving only about five miles to be finished.

New Tannery.—The new tannery in Santa Rosa will soon be in operation. The vats are msde, work-sbop up, and tbe proprietor expects to be turning out leather within tbe next ten days.

Good Yield.—One of the largest yields of quicksilver yet recorded in Napa county is that of the California company. On last Satnrday tbey sbipped 67 flasks of this metal from their mine, all the result of one week's work.

Recent explorations have developed excellent cinnabsr indications in Alexander valley, on Sausal creek, about 20 miles west of Calistoga. At least a hundred locations have already been made.

The dam of the Exchequer mill, at Silver mountain, Alpine county, whicb was swept away about a month ago, has been rebnilt, and the mill is again in operation.

Geologist Condon is in King connty, W. T., exnmining the various coal mines for geological specimens and scientific purposes.

During June there were 23,870 tons of ore shipped from the Comstock mines.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

Richer.—*Chronicle*, June 27: The Exchequer quartz wagon passed our office to-day loaded with very rich ore. Many pieces, the size of a man's head, were bespangled with native silver. Next week ore will be taken out in larger quantities.

AMADOR COUNTY.

Mining.—*Ledger*, July 4: Reports from the various mining localities in the county come in very favorably and give assurance that the gold yield will be very considerable before water will become scarce.

The placer mines in the vicinity of Volcano, Pine Grove, Aqueduct city and Fiddletown are returning fair pay for labor bestowed.

The tunnel at Volcano is progressing expeditiously.

About Enterprise, a number of quartz ledges partially developed, are now being systematically worked.

At Plymouth, the Phœnix more than holds its own, and can be classed among the valuable mines of the county.

At Drytown, work is steadily progressing on the Govsr, and with increasing evidence of a permanent valuable mine.

The Gold Mountain mining company, near Lower Rancheria, are pushing on with every encouragement. The White Mountain and Golden Crown companies are located on the same ledge, and work on each is vigorously carried on.

The developed mines are turning out their usual monthly harvest of gold in rather increased quantities, and all bid fair so to continue.

The tunnel under the Butte mountain is being rapidly driven in, and although it will require time to reach the interior basin, yet it will be accomplished in good time, and the long buried treasure beneath this grand old land-mark will be brought to light.

The Republic.—This mine is situated near Jackson, on the great mother lode passing through this county, and at its present stage of development shows a good vein of very rich rock. We know of no undeveloped mine offering better inducements to capitalists to invest than this. Mr. Joseph Sayers left for San Francisco on Wednesday morning for the purpose of making arrangements to prosecute the work of developing the mine. We hope he will be successful in enlisting capital in the development of this mine.

McKay & Love.—The tunnel on this mine is being pushed forward with commendable energy, and at the present time the ledge is looking and prospecting finely, much better than the owners expected to find it at the point the tunnel has reached. The tunnel is now in about 200 ft., and has been run on good rock the entire distance. Two hundred ft. more will strike the main chimney.

Amador Canal.—This splendid work is now about completed, and in a short time every kind of business in this county will begin to feel its beneficial effect.

BUTTE COUNTY.

Record, July 4: The Bull Creek diggings are paying from $2 50 to $50 to the hand per day. The miners complain of a scarcity of water.

CALAVERAS COUNTY.

Contract Let.—*Chronicle*, July 4: The contract for sluicing off the surface of the Quaker City quartz mine, for the purpose of obtaining a solid foundation for the machinery, has been let to Cowan & Co.

San Bruno.—Everything is progressing favorably at the San Bruno. Three stopes are being worked and the tunnel run ahead. The ledge continues wide and rich. About 20 tons of ore have been mined since the late clean up.

Mill Nearly Completed.—The mill in process of erection on the Austrian mine at Jesus Marie is nearly completed.

The Horse-thief Mine.—Good rock is now being obtained from the Horse-thief mine at Jesus Maria. The running of a new tunnel to strike the vein is completed, uncovering a good quality of ore. The water-power arrastra connected with the mine will be set at work upon the rock soon.

Sandeason Mine. — The work of sinking the shaft in the Sanderson mine, at Railroad, proceeds steadily. It has reached a depth of 295 feet. A first-class quality of rock is being obtained.

COLUSA COUNTY.

Rich Strike. — *Sun*, July 4: The Abbott Quicksilver Mining Co. have heretofore been working on two tunnels, about 2,000 ft. apart, out of which they have been taking rich ore. In order, however, to get ready for their furnace, they commenced on Monday a new tunnel, and we learn that they have struck the richest body of ore ever found in any of the mines in the Coast mountains.

MONTEREY COUNTY.

Monterey Coal Mines.—*Democrat*, July 4: The company working the original claim have now quite a force of men employed. It was found, sinking upon the 4-ft. seam heretofore reported as reached by a tunnel, that it thickened as the workmen went down upon it an inch to the foot. To save time, therefore, a new tunnel was projected a considerable distance below the first, and this is expected soon to strike the seam. As to the quality of the mine, we have but to repeat that there is coal enough in sight to warrant any reasonable expenditure of capital in preparations for working it.

NAPA COUNTY.

Gold in Napa City.—*Register*, July 4: The workmen employed in sinking a well for the new hotel in East Napa, over the Third street bridge, on Saturday, when at the depth of 22 feet, struck a stratum of gravel mingled with clay, which, on washing, showed a fair prospect of gold. The metal was in small grains, some as large as a pin's head, mixed with black sand. It may be that there is one of the ancient river beds that have at other points been found so prolific in the precious metal. Further excavations will tell the story. The discovery was made by Mr. W. Kennedy.

This morning work was continued to a depth of 25 ft. In the morning, Mr. Henry Fowler washed out a pan which he estimated to be worth from two to three cents. A boy picked up among the gravel a piece worth from 25 to 30 cents, washed and water-worn. A pan was washed out in our presence at 2 P. M. to-day, which we think is worth about four cents. Who knows but Napa has not some gold mines yet?

NEVADA COUNTY.

Omaha. — *Foot-Hill Tidings*, July 4: This mine, near Missouri Hill, is looking first-rate. The drift running east from the bottom of the shaft recently opened a ledge 2 ft. thick, which shows gold to the naked eye and abounds in sulphurets.

Hawley Brothers own a gravel mine near Columbia Hill, in this county, and also a water ditch, enabling them to work their mine with great profit. A clean-up made last week, after a 6 week's run, turned out gold to the value of over $3,700. As the expenses are said to be only about 9 per cent. of the gross product, owing to the fact that they have free water, this mine may be said to be a good thing to have, and as the ground owned by the brothers covers nearly 40 acres, and the gravel thereon is 60 to 80 feet deep, they are likely to have paying work for some time to come.

The mines of Grass Valley are giving out, indeed, and in the most approved manner. We saw at Delano's bank on Wednesday two gold bars valued at $13,000, from the Empire—Ophir—mine, the result of 14 days' run.

Perrin's mine, Slate Ledge, is turning out ore that mills over $20 per load; and the workmen struck a ledge in the west drift on Saturday last which shows good rock and is 1½ ft. thick. The last clean-up was $672 from 28 loads of rock.

Burleigh Drills.—The machine drills at the Idaho are proving all that has been claimed for them. One drill it is said will put in 60 inches of holes an hour. The average made by hand drill, three men to a drill, has been 9 inches in the same kind of rock.

A brick worth $2,174 was the product of the run of Larrimer mill on New York hill rock, mentioned by us last week. There were 57 loads of rock worked, which makes the average about $38 per load.

PLACER COUNTY.

The Bellevue Mine.—*Herald*, July 4: From this mine we have the following good news. After a short run of ten days, on average ores, cleans up $5,426; 155 tons crushed, yielding $35 per ton. A large portion of the rock crushed, was taken from shafts Nos. 4 and 5, where the ore is not as rich as the chute of ore in shafts Nos. 1 and 2. The latter is now open, and stopes in shape for the extraction of high grade ores. The next clean-up should be proportionately larger.

PLUMAS COUNTY.

Copper Specimens.—*National*, June 27: Mr. Sanderson, of Long Valley, has sent us some fine specimens from his newly discovered ledge, near Summit. The rock shows splendid indications, and the discovery is close enough to the railroad to make it valuable at once.

Heath's claims at Argentine will turn out well, as he is driving through an immense quantity of rich dirt. Bolinger & Simmons in their new claim on Spring Garden creek, are taking out good pay, and think they have a valuable and extensive piece of ground. Bushman's claims, on the head of Black Hawk, are paying first-rate, and the indications are that they will continue to do so.

SISKIYOU COUNTY.

Good Pay.—Yreka *Union*, July 4: The claim of Spangler, Moore & Co., on lower Humbug, is paying well. Since they commenced to wash up the yield has been over $50 a day to the hand. This we call doing well for the year 1874 in Siskiyou. The claim was taken up and commenced about 20 years ago.

Commenced.—Little, Swan & Varney have commenced work on their claim on Oak Bar. The pay they received last year leads them to entertain hopes of doing pretty well this season.

Stopped.—From Mr. Gillis we learn that work has been stopped at the mine on Hayden hill, near Adin, and the loose property of the company is being sold off.

SONOMA COUNTY.

Ida Clayton and Yellow Jacket.—*Democrat*, July 6: Brick is being made on the Knight's Valley ranch for the construction of a Knox & Osborn furnace to accomodate both the above mines. One hundred thousand brick are now in process of burning. A flume, 18 inches at the bottom and 36 inches at the top, has been constructed to convey water from Mill creek, a distance of a mile. The furnace will be located one and a half miles from the Yellow Jacket, and one mile from the Clayton mines. Forty Chinamen are engaged in building a good road. A survey is being made for a road from the Great Western mine to Knights Valley ranch house, which, when completed, will connect with the Calistoga and Geyser road, and with a road from this place to Knight's valley will afford direct communication between Santa Rosa and Middletown, and other points in Lake county, through Loconoma valley. This route would avoid the grade over St. Helens mountain and place the trade of the lower portion of Lake at the door of our merchants. Santa Rosa would then be nearer to them by way of Knight's valley than either Calistoga or Napa. Immediate steps should be taken to avail ourselves of the advantages to be derived.

TULARE COUNTY.

Another Discovery.—Visalia *Delta*, July 2: We were shown, last week, a sample of rock from a new lode recently discovered on Little Kern river, in Mineral King district. The specimen weighed some 15 pounds, and seemed nearly as heavy as lead.

We were shown by David M. Adams, Esq., a certificate of assay, giving a result of a test of a sample of rock taken from the surface of the new discovery known as the bullion lead in the Mineral King mines. The assay shows $30.16 in silver, and $105.51 in gold per ton. The lead is said to be over 30 feet wide.

TRINITY COUNTY.

Developing.—*Journal*, July 4: Siegfried & Co. are at work on their quartz ledge, at the head of Indian creek, and have uncovered about 1,000 feet, being down to the depth of ten feet, in places, with no falling off in the prospects. The lode has been named "Bully-choop," it being situated on the mountain so named by the Indians.

TUOLUMNE COUNTY.

Table Mountain Alpha.—*Independent*, July 4: Superintendent Collins of the Alpha has shipped per Wells, Fargo & Co.'s Express, July 1st, at Jamestown, $350, the result of two days' washing. He is just opening out preparatory to work in earnest.

Table Mountain Blue Gravel Co.—This claim is showing the richest kind of ground—richer than any ever taken from the mine before; large pieces or lumps are picked up while getting out the gravel. This is in the south end of the mine, and near where similar results were obtained some 20 years ago, where the old and original tunnel was run in the mine. The shipment of July 2d, of one week's run, was 100 ounces of gold.

VENTURA COUNTY.

Coal.—*Signal*, July 4: Mr. Callis has discovered what, upon examination, proves to be a coal mine. A district has been located called the Hubbard coal mining district. Mr. A. F. Hubbard is the recorder.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, July 2: The ore breasts on the 1,200, 1,300 and 1,400-ft. levels are still looking well and developing steadily. Most of the ore extracted is from the 1,200 and 1,300-ft. levels, but little more being done on the 1,400-ft. level than opening out and getting ready for future operations. Prospecting the ore vein is still vigorously prosecuted on that level, the west wall of the vein having never yet been reached.

Savage.—Sinking the main incline below the 2,000-ft. level goes steadily on. The south winze from the 1,900-ft. level has made the connection with the south drift on the 2,000-ft. level, giving a much needed circulation of air, and greatly facilitating the work in that portion of the mine. The south drift is now being enlarged.

Justice.—The water is all out of the incline, and sinking is going ahead. About 40 tons per day of good ore is being taken out through the old Weller Defeat shaft. A large force of men are employed excavating for the foundation of the new machinery. This machinery is now being manufactured in San Francisco, and when completed will in power and finish be second to none on the line of the Comstock.

Gould & Curry.—A station has been opened in the double winze at the 1,800-ft. level, and cross-cutting the ledge commenced at that point. The quartz on that level shows a great improvement in the quality, and there is strong hopes entertained of a good development of ore in that quarter soon.

Utah.—On Friday last a large flow of water was struck in the bottom of the shaft, which stopped the sinking, and has kept the tanks busy hoisting water ever since. The flow of water is again gradually subsiding.

Nevada.—The mine being now well opened and developed at the present working level, showing a large amount of pay ore, work is suspended at that point, and in order to open the mine 100 feet deeper, a new tunnel is being started from the ravine south of the hill.

Chollar-Potosi.—Daily yield, 100 tons of ore, assaying $30 per ton. There is little or no change in any of the ore-producing sections.

Sierra Nevada.—Daily yield, 60 tons of ore, keeping the mill steadily running. The ore breasts to the west end north show somewhat of an improvement in the quality of the ore extracted. The hydraulic works are doing good execution. The erecting of the hoisting and pumping engines and other machinery is fast approaching completion.

Dardanelles. — Sinking the new shaft is making good progress. The preparatory surface work for the erection of the new hoisting machinery is making steady progress.

Hale & Norcross.—Cross-cutting and prospecting is vigorously prosecuted at points near the north line and near the center of the claim on the 1,900-foot level. The main west drift of the 2,000-foot level has cut the ledge and developed some fine ores which bids fair to develop into a large and paying body.

Ophir.—All work has been suspended in the mine during the past five days, pending a settlement of a controversy among the trustees in regard to the superintendency, two parties claiming the control in this matter.

Kossuth.—The excavations for the foundations of the new machinery are completed, and the stone work has just commenced.

Globe Consolidated. —The face of the north drift at the head of the incline is still in fair grade ore. The winze from the track floor is down 130 feet. The ore stopes are all looking finely.

Caledonia.—The main shaft is down 25 feet below the 800-foot station, the bottom still in clay and quartz, and the sinking making splendid progress.

Bullion.—The main north drift on the 1,700-foot level from the Imperial is still being driven vigorously ahead, the face in quartz and low-grade ore.

Julia.—The excavations for the foundations of the new machinery are completed and the stone foundations are being laid. The ore development in the south drift on the 900-foot level still shows finely and gives great encouragement.

Imperial Empire.—The south drift from the main east drift on the 1,850-ft. level is still driven slowly ahead, the face in about $30-ore, with prospects of an increase if anything, in the value.

Alamo.—Sinking a new shaft was commenced a short time since, which is now down 75 feet, at which depth a rich body of ore has been struck, very much resembling the rich pockets of pay ore found near this surface in early days. This body of ore bears every appearance of being both rich and extensive.

Buckeye.—Driving the south drift at the first station level is making steady progress. It is expected that connection will be made between this drift and the south winze in about two weeks more, when the extraction of ore from that portion of the mine will be commenced.

Dayton.—The flow of water through the drain tunnel is still gradually diminishing. The mill is kept steadily running on the ores in reserve.

Sutro Tunnel.—Work is progressing actively in the main headings, and both east and west along the line of the tunnel, from the bottom of shaft number 2. The Burleigh drills are doing very effective work, and the construction of the tunnel is advancing at the rate of about 100 ft. per week.

Baltimore Consolidated. — The new machinery is all in complete running order, and works with the utmost perfection.

Leo.—The main tunnel is still being driven ahead into the hill, following the lead at a fair rate of progress. The ore streak in the face of the tunnel remains about the same.

Silver Hill.—The quartz in the north drift on the third station level has greatly improved in appearance in the past four days. The ore in the east cross-cut from the south drift, at the first station level, has widened out to about four feet, and is of a fine quality.

Overman.—Both the north and south drifts on the 1,200-ft. level are being driven vigorously ahead.

Mint.—Sinking the main shaft is making excellent progress.

Yellow Jacket.—Sinking the main incline goes steadily on. Cross-cutting on the 1,400 and 1,540-ft. levels is still vigorously prosecuted.

Belcher.—A new winze has been started on the 1,400-ft. level, which is down 35 ft. The new air shaft is down 165 ft., and is being driven vigorously ahead. Daily yield, 550 tons of ore. The ore breasts throughout the entire mine are looking splendidly.

Crown Point.—Daily yield, 550 tons of ore. The ore breasts throughout the entire mine are looking well and yielding splendidly. The middle winze, following the west wall of the ledge, is down 90 ft. vertically, the bottom still in fine ore. Sinking the main incline is making steady progress.

Tyler.—Nothing has been done in the mine during the past week, owing to a breakage of some of the pumping machinery.

Knickerbocker.—The water is nearly drained from the shaft. The body of quartz developed in the main west drift, at the 400-ft. level, is of a fine character, but only assays about $7 per ton.

Lady Bryan.—The new shaft is down 230 ft. Everything working splendidly.

California. — Driving the north drifts on both the 1,400 and 1,500-ft. levels from the Virginia Consolidated shaft is making excellent headway, as is also the south drift from Ophir, on the 1,400-ft. level.

Pictou.—Still driving ahead the tunnel for the main lead. Stringers of quartz keep coming in.

Woonville.—Still driving northward on the ore vein on the 400-ft. level, which is looking very encouraging.

Sutro.—Still driving the main west tunnel ahead. The flow of water continues to steadily increase, but does not interfere with work.

Occidental. — Sinking the incline winze below the tunnel level, is making good progress, the bottom still in fine ore.

New York.—The shaft is cleaned out, and an east drift started to cut and prospect the ledge at the 600-ft. level.

Fair of State Agricultural Society, 1874.

We have received a premium list of the California State Agricultural Society for the fair of 1874, at Sacramento. The fair commences on the 21st and ends on the 26th of September. Over $20,000 are appropriated to premiums. The departments are comprehensive, embracing nearly everything of an industrial character, and much of art, and are judiciously classed.

An opportunity is now offered for the ardent champions of special localities to prove their superior advantages. The outside world will now have a chance to judge each favorite spot by its fruits. In no way can a local paper serve the interests of its neighborhood so effectively as by stimulating its readers to make the best possible showing of the products of the locality. No country is so closely scrutinized in this respect as California. The wonderful versatility or variety of its climate and soil are well known, and the question, In what part of California shall the new-comers locate? is as thoroughly ventilated as that of coming to the State at all. We hope to see each and every part so profusely and judiciously advertised at the approaching fair that whatever a man may want he will know just where to find it.

It is expected that the display of farm stock at the coming fair will excel that of any previous exhibition, as the past year has been remarkable for the increased enterprise manifested by stock-breeders; especially in the cattle department. The exhibition is also looked forward to with the highest anticipations, as the growing crop gives promise of unusual excellence. The approaching fair will also undoubtedly do much toward solving the question of the disposal of our enormous amount of fruit, as the great improvements made in drying and canning will be properly represented there. A more complete list than usual of agricultural implements of California manufacture is also anticipated. The above, however, are mere items among the new points of interest connected with the coming fair; while the standard merits of our annual exhibition will, at least, be up to any former display.

There is a large and extremely interesting class of California industries, embracing those matters that as yet hold the position of experiments, which we hope will be exhibited each in their present degree of perfection. All of them will command attention, and some of them are of great importance, and are expected to become prominent among the great interests of the State. Let the ardent enthusiasts and patient experimenters in these matters show the world at what point they have arrived.

A Novel Cure for Dyspepsia.

Some years ago, a physician in New York city published a small book, in which he gave written certificates of marvellous cures of dyspepsia. His cures were mysterious and very effective. He charged $500 for a cure, and his patients were most solemnly pledged, with much ceremony, to profound secrecy as to the mode of treatment. After the death of the doctor some of the patients felt themselves absolved from the obligations of secrecy, and one of them disclosed these facts:

After correcting some of the most grossly dietetic habits, he required each patient to spend 10 or 15 minutes in the morning, at rising, in kneading and slapping his own abdomen with precision. This was to exteud over the stomach, bowels and liver. This was repeated just before dinner; again at 7 P. M., with precision on going to bed. The patient was requested to be temperate and regular in all his habits, exercise much in the open air, and attend most assiduously to the slapping, kneading and percussion of the whole abdomen; and as the result, we are informed that malignant cases of indigestion that had resisted all other remedies, yielded to this:

"In every case of indigestion," says Dr. Lewis, "no matter what may he its character, slapping the bowels with the flat of the hands on risiug in the morning, four honrs after breakfast, and in the evening on going to bed, is excellent treatment. I cannot oonceive of a case of chronic indigestion which such a manipulation would not relieve. If a person is so weak that he cannot perform these slappings and kneadings for himself, then the hands of a discreet person should be employed." It is marvellous how a stomach, sore and sensitive as it is at first, and hardly able to bear a touch, will strengthen under these operations, and bear, for a short time, with pleasure, pretty rough handling.—*New Age.*

Prospecting.—North of this city, from the Sierra Nevada to the race course, a distance of four miles, all along the range of the Comstock, evidences of the prospector's industry are visible. New shafts are being sunk on either side of the road, and good prospects are said to be obtained. The energy displayed by mine-owners in that part of the conntry will soon make it one the most valuable of our mining sections. The Utah miuing company have a shaft 510 feet in depth. The drifts south of the main west drift, on the 400-foot level are being continued. They have encountered some fine-looking quartz in the openings of that mine. The main drift in the north mine is steadily being advanced in the ore vein. The mine is within 100 yards of the race track. It would not surpriee us to hear of rich developments in that section.—*Virginia Chronicle.*

Idaho Mines.

From the Owyhee *Avalanche*, of the 27th ult., we glean the following: The prospects of our camp continne better and better all the time. Ontside of the Comstock, Owyhee will produce more bullion this season than any other mining district on the Pacific coast where the milling process is carried on. Commencing with August our bullion shipments will not fall short of $250,000 per month during the remainder of the year. At least thirty more stamps than we have in camp will be needed to crush the ore that can easily be taken from our mines. The Golden Chariot and South Chariot can furnish enongh ore to keep every mill in camp pounding away night and day; more mills will be needed for the ore produced by Empire, Mahogany, War Eagle, Illinois Central, Poorman, Silver Cord and several other mines that are being worked by private parties. The good times that we have all been waiting for are dawning upon us at last. All doubts are dispelled, and confidence is infused into every branch of industry carried on in our midst. Our merchants are receiving at least three times the quantity of goods than ever before, at this season of the year—and they will find sale for them, too. A great many more miners will be needed, and the army of wood-choppers, teamsters, coal-burners, etc., will also call for strong reinforcements. Hurrah! for old Owyhee at last.

Golden Chariot.

Superintendent Keown shipped to San Francisco, last Saturday, 4 bars of bullion, valued at $11,914.45, making about $42,000 since the 2d inst. The mill is running night and day.

South Chariot.

This mine continues to open up splendidly, and everything will be ready to take out large quantities of ore as soon as the new hoisting works get in opsration, which will be some time next week. About 80 miners will be employed in taking out ore, and the South Chariot and Cosmos mills will be constantly kept running thereon.

Mahogany.

In company with Superintendent Pheby, we visited this mine last Wednesday afternoon and witnessed the starting up of the new hoisting works, which operate like a charm. The engine is 44-horse power, 20-inch stroke, and can be run 100 revolutions in a minnte. It is estimated that the new machinery will work the mine to a depth of 1,500 feet. The ninth level crosscut has tanped the ledge, which is two feet wide. They will immediately commence sinking for the tenth level, in which will undoubtedly be struck the big shute of ore found in the eighth level of the South Chariot, as it is making south at the rate of about 100 feet in 100 feet.

Empire.

Superintendent Hoyt made his first shipment of Empire bullion this week—5 bars, valued at $8,945.89. The mine continnes looking first-rate and is in good shape for yisldiug large quantities of ore.

War Eagle.

The seventh level drift, both north and south of the shaft, shows a two-foot ledge of fine milling ore. The sixth level has been timbered in good shape, and they will soon commence sinking for the eighth level.

The Hazard Mine.

The Hazard mine, now being worked by a San Francisco company, has proven itself to be one of the best paying mines in the State. It is sitnated on the Volcano cañon, abont one and a half miles from Michigan Bluff. It was located in 1858 by Forrest, Allen and others, who sunk a shaft 150 feet deep, and found good prospects. On account of the insufficiency of their machinery, they were unable to work to any advantage, the water being in the way. They sold the claim in 1872 to Messrs. Kewen, Breeze, Carroll, Loyd, Davidson, Huntsman, Mnrphy, Lever and Brainard, who commenced operations by putting in an engine of twenty-five horse power, hoisting-works, and a six-inch Cornish pump of four feet stroke. They sunk the shaft a few feet deeper and ran a tunnel on the channel nine hnndred feet to the east. The mine was worked nnder the superintendence of Mr. Kewen up to April last, when he resigned, to take charge of the Golden Chariot mine, at Idaho. Since then, George Johnson has had charge of the work. The company is working from twelve to sixteen men. They own one hundred and fifty acres of mining ground, by purchase and location, and have the benefit of two miles of cañon, for nndercurrents, flumes, etc. The bed of pay gravel is from six inches to six feet in thickness, the balance of the ground being hard cement. It is the intention of the company to put up a mill next season, for the purpose of crushing the gravel. They have already expended about $40,000 in developing the mine. One very note-worthy feature of the company is that its men have been regularly paid off every month, since work began, without reference to whether the claim was paying or not. No shares have been sold, and none offered for sale.—*Placer Argus.*

The Consolidated Virginia mine, on the Comstock, is putting up a new 60-stamp mill. The men are now grading a site for it. The ore raised from the mine can be run to the mill in the same cars used in bringing it up the shaft. The machinery for the mill is being manufactured in San Francisco, and will soon be completed.

Olive Growing.

When will the list of California fruit productions be complete? Pomona, like the rest of her sex in California, is mighty hard to please. The more she has, the more she wants. There is no portion of the earth that can vie with this in variety of fruits, and probably there is no place where more experimenting is done in introdncing new varieties. The olive is among the anticipated acquisitions to the California fruit-list, and experiments in localizing it are observed by many with a good deal of curiosity. To such, the following from the San Diego *Union* will be of interest:

Last week we had the pleasure of visiting the beautiful place of H. M. Higgins, on the Sweetwater. Many of the things seen there are worthy of special notice; but at present we shall speak simply of the young olive-trees. Not many had been planted—only enough for an experiment; but the experiment is worthy the attention of all our landholders. The trees are of only two years' growth from cuttings, and yet they have already begun to bear. Another year will give quite a good crop; and each succeeding year the yield will increase until the trees have attained full maturity. The prevailing impression has been that the olive will not bear until 10 years old, this being the ordinary time of bearing in other portions of the world, with most of the varieties cultivated. But in California, with the varieties here planted, the case is different. Colonel Hollister's extensive orchard, four miles back from the coast, at Santa Barbara, was in bearing three years after planting. The Kimball Brothers, also, have two-year old trees full of fruit, on their lands at National City, upon the Bay of San Diego. Mr. Higgins' place is farther off the coast, being about eight miles inland, where the air is less saline, and the winds from off the ocean are very much moderated. At these three places the trees are not planted in valley land, but on the *mesa* or table land. By mulching, for a yard or more, all around the trees, or by covering the surface with sand from six to eight inches deep, the under-soil is kept loose and moist; so that only occasional and moderate irrigation is required during the first three or four years, until the roots have struck sufficiently deep to reach permanent moistnre. At the Mission of San Diego, the old trees, planted by the missionaries, a hundred years ago, are in valley land, and they probably never were irrigated. Their present flourishing condition, after many years of neglect, and the vigorous growth and healthy appearance of the trees at the Hollister, Higgins and Kimball places, show that from Santa Barbara down to the Mexican boundary, all along the coast, and for at least 10 miles back, the soil and the climate, on upland and in valley, are peculiarly adapted to the growth of the olive.

Protection to Game.

For the benefit of those who are in doubt as to where sporting is an infringement of the game law, we give from a contemporary the following, which will be a safe guide in hunting and fishing matters:

Quail, Ducks, Etc.

In the counties of Lassen, Plumas and Sierra, it is unlawful to "take, kill or destroy" quail, partridges or grouse between March 15th and September 15th, or any kind of broadbill ducks between March 15th and August 15th.

In Los Angeles and San Bernardino it is unlawful to kill quail, partridges, grouse, or any broadbill duck between August 1st and the first of April of the next year.

In all the other counties of the State none of the feathered creatures above enumerated must be molested between March 15th and September 15th.

Trout.

Trout cannot be lawfully caught in any part of the State between October 15th and April 1st, in the following year. And it is unlawful to catch trout, except with hook and line, at any time, in the counties of Santa Clara, Santa Cruz, San Mateo, Monterey, Alsmeda, Marin, Placer and Nevada. It is a misdemeanor to take, catch or kill trout in any part of the State, by the use of nets, weirs, baskets or traps.

Elk, Deer, Antelope.

The law protects elk, deer and antelope, from January 1st to August 1st, in all the State except El Dorado, Placer, Nevada, Sierra and Siskiyou counties, where it is not permissible to hunt such game from February 1st to August. As this is the kind of game our inquirer is longing for, he will have to wait till August. [Laws of 1871-72, page 433.]

Salmon.

The Penal Code makes it a misdemeanor to "take or catch" salmon between June 1st and September 1st; nevertheless the restaurants and fish stalls have no lack of salmon at present, and have not lacked it during the whole of last month. By what authority this fish is caught now it seems difficult to surmise. An examination of the laws of 1871-72 and those of 1873-74 shows no amendment to the Code provisions referred to.

Fighting is going on near Estella, Spain, where Gen. Concha was killed, thus far without result. It is thought that the Carlists will be forced to abandon that place.

Pioche Mines.

The Pioche *Record* of the 28th ult. says: The situation in mining matters exhibits so little change from our last week's report, that it is difficult to find a noteworthy subject of remark. The work in the Raymond & Ely is limited strictly to opening the lower level, 1,200 feet from the surface. The eastern drift presents the same appearance in the face as last noted, a sufficiently large vein, but carrying no ore. The drift on the western side is still in the cross-head, and has not yet reached the line of the further vein. From the Magnet Co's ground the usual amount of ore is being taken out, the grade of which is without any alteration.

At the Meadow Valley shaft No. 3, the eastern branch of the 1,200-foot level has reached a length of 55 feet. The ground through which it is progressing is still very broken. On the western side the drift is in 120 feet, and shows a strong and promising vein, but carries little or no ore. The eastern drift of the 1,100-foot level is now in 242 feet. The face shows well and exhibits considerable metal. The Summit, or No. 5 shaft, is still in the north wall of the vein. The formation is extremely hard, putting rapid progress out of the question. Its depth is 1,092 feet. If pumping machinery is erected by this company, it will necessarily be placed in this shaft, which will probably have to be sunk 300 feet further to reach the water level.

The cross-cut from the Pioche's new shaft is now in about 200 feet, and is progressing as rapidly as the nature of the ground will permit.

The main shaft of the American Flag is down 992 feet, and it is expected that by the end of the mouth it will be sufficiently deep to open a new station, which will be the tenth. In the westerly drift above, which is in 160 feet, the face shows a ledge three feet in width, carrying some excellent ore, assays of which vary from $85 to $165. The appearance of this drift is very encouraging. The company's mill is kept busy working tailings.

The Havana Co. are making a road to permit the access of teams to the dump, and will probably commence hauling ore to-morrow to the Floral mill.

Gold Mining.—On Cedar hill, north of this city, the Sierra Nevada company are working away at the side of the mountain. The hydraulic has been in operation about three weeks, and it is said that the claim is now paying $1,000 a day. They are supplied with water by the Virginia and Gold Hill Water Company, and are running 500 tons of gravel daily through an eighteen-inch flume. During the day all the water brought into the city by the water company is used by our citizens. At night, however, the water is shut off from the city, and is allowed to run from the flume of the company into a large tank to be used for hydraulic purposes. From this tank the water is conveyed in an iron pipe a distance of seven hundred feet. The hydraulic claim is being worked but ten hours each day, with one hundred inches of water forced through a two-and-a-half-inch nozzle, great execution being done. The Sierra Nevada company have ground enough to last them several years. This ground would have been worked years ago, were it not for the scarcity of water, as it was known to be rich in gold. Now, however, the whole hill will probably, by the use of the hydraulic, be made to pay a handsome profit to its owners.—*Virginia Chronicle.*

Accident at the Belcher.—Yesterday forenoon, between the hours of 9 and 10 o'clock, there was a grand smash-up in the Belcher incline; but, fortunately, no one was hurt. The giraffe and back-action, however, were knocked into kindling-wood. The giraffe and back-action had both been loaded at the foot of the incline, and had been hoisted up to within twenty-five feet of the top, when the cable suddenly parted. Giraffe and cars went down to the bottom of the incline at a tremendous rate of speed, and running into its rocky face at the bottom, were splintered into a thousand fragments. Luckily, after loading the cars, the men had ascended the incline in order to get some water, and for the purpose of cooling off for a few minutes. Thus they were all out of the way of harm. Had they remained at the bottom, several of them must have been killed or terribly injured. One man, Johnny Smith, was on the giraffe when the cable broke, but the sudden jar threw him off; and, by this fortunate accident, his life was undoubtedly saved. Why the cable should have parted as it did, is one of those things that are "past finding out," as up to the moment it broke it was considered perfectly safe.—*Gold Hill News.*

No Water in the Sun.—M. Janssen states that Croce-Spinelli, in his recent balloon ascension to an elevation of 25,000 feet, finds by spectroscopic observation that the lines in the spectrum, ascribed to the vapor of water, are due to the terrestrial and not to the solar atmosphere; since when the former, by reason of the elevation, is greatly eliminated, the bands are also in like proportion decreased. It may, therefore, be considered that in the sun there is no watery vapor, at least in appreciable quantity, and that consequently the temperature of that body is not yet sufficiently lowered to allow water to form.

A Washington dispatch states that Col. H. C. Whitely, Chief of the Secret Service, has not resigned, but has demanded a thorough investigation, which has been granted.

Useful Information.

Etching Iron.

Prof. Kick, in Prague, bas devoted much time and attention to studying tbe subject of etching iron with acids. Tbis method is not a new one for arriving at a knowledge of the quality of iron or steel, having been used with some success for a long time. Some kinds of iron exhibit what is known as tbe passive state, and are unacted upon by acids until this state has been destroyed by heating; another disadvantage was that the surfaces thus prepared were inclined to rust very soon. After a series of experiments with nitric, sulpburic and hydrochloric acids, and etching solutions of copper salts, Prof. Kick found that a mixture of equal parts of hydrochloric acid and water, to which was added a trace of chlorido of antimony, was the best etching solution. Tbe chloride of antimony seems to render the iron less inclined to rust, so tbat, after washing thoroughly in warm water, and applying a coat of Damar varnish, the etched surface may be preserved quite clean. The smooth surface that is to be etched is surrounded with a ridge of wax an inch high, as is done in etching copper plates, and tbo acid is poured into the dish thus formed. At a temperature of 55 to 65 degs. F. the action soon begins as shown by the gas evolved; in winter the etching is poor. The time required is usually one to two hours, but the etching should go on until the texture is visible. Every half hour the acid can be poured off without removing the wax, the carbon rinsed off and the surface examined. If too much chloride of antimony is added to the acid, a black precipitate will soon form, which can easily be distinguished from the carbon. One drop of chloride of antimony to the quart of acid is sufficient. When the etching is finished, the wax rim is removed, the iron washed first in water containing a little alkali, then in clean water, brushed, dried and varnished. If in a few hours it begins to rust, the varnish should be removed with turpentine, which will also take off the rust, and then varnish again. The appearance of different kinds of iron when etched is essentially as follows: Soft or sinewy wrought iron of excellent quality is attacked so equally by the acid, and so little carbon is separated, even after several hours' action, that the surface remains bright and smooth. Fine grained iron acts the same; the surface is still smoother, but a little darker. Coarse grained and cold short iron is attacked much more violently by acid than the above. In 10 minutes, especially with the latter, the surface is black. After thirty minutes a black slime can be washed off, and the surface will remain black in spite of repeated washings, and exhibits numerous little holes. Certain parts of the iron are usually eaten deeper, while others, although black and porous, offer more resistance. By allowing the acid to act for an hour or so, then washing, drying and polishing with a file, a distinct picture is obtained. Malleable cast iron, we know, rusts more easily than wrought iron, and it is interesting to know that the action of acids is also violent, the surface being attacked very violently. In puddled steel the color, after etching and washing, is gray, with quite a uniform shade, and the lines are scarcely visible. Cement steel has a very similar appearance, the lines being very weak. In Bessemer and cast steel the etched surfaces are of a perfectly uniform gray color, with few, if any, uneven places. The softer the steel the lighter the color. On etching, the finest hair-like fractures are rendered prominent. A piece of steel, which looked perfect before etching, afterward exhibited a hair-like fracture throughout its whole length. Gray pig iron acts like steel; the etched surfaces have quite a uniform gray color. When different kinds of iron are mixed the acid attacks that for which it has the greater affinity, while the other is less acted upon than if it were alone. Etching also enables us to determine with considerable accuracy the method of preparing the iron, as in case of rails, as well as the kinds employed.—*Iron Age.*

Preserving Iron.—Experiments on the preservation of iron surfaces show the advantages of coating such surfaces with heavy mineral oil. The action of the oil is said to be twofold. It is detergent when freely and vigorously brushed over an already rusted surface, seemingly loosening the bulk of the rust, while it also darkens that which remains; and it likewise acts as a varnish, if applied after the cleansing has been effected, or to new and bright work. Its superiority to vegetable or animal oils depends upon the fact that the bulk of the oil in the latter case evaporates, and leaves only a very fine film behind. If the oil is light, and fully refined, it evaporates so completely as to do but little good; but if tinged, or "once-run" oil of sufficiently high gravity be used, the resinous or carbonaceous matter which gives the tinge to the oil remains behind, and forms a thin, protecting film of varnish. Ordinary varnish leaves far too thick and obvious a film, while the film of the once-run oil does its work of protection without displaying itself. As regards the density of the oil required for this purpose, that which stands between burning oil and good lubricating-oil is found to be the best.—*Technologist.*

Preserving Wood with Tannin.—A consideration of the various materials best adapted for preserving wood, leads Hatzfeld to conclude that substances containing tannin are the best preservatives.

Spurious Coins.—It seems that science is impartial in conferring her favors. Counterfeiters and philanthropists make equal progress. Lately a new imitation has appeared in England, as we learn from the *Ironmonger*. That paper says: We regret to find it necessary to caution our readers against taking spurious gold coin, as it appears that the usual tests of musical ring, milled edge, or even weight, are no longer reliable tests. That "all is not gold that glitters" is now clearly demoustrated, for scientific roguery has now so far advanced that tokens of platinum alloy are being produced so exactly resembling the precious metal as to deceive the most careful and experienced business men. So close, indeed, is the imitation, that a specimen taken recently by a London tradesman was only suspected on clipping the edge, and specimens, being shown to the officials at the Bank of England, were put through the ordinary tests and admitted to be perfect in form and weight. The discovery is anything but pleasant, and the natural question arises—How are we to guard against such scientific smashing?

Ozone.—That ozone is not oxygen is proved by the contrast in some of their properties. Oxygen has no taste, ozone tastes, as one writer expresses it, like lobster, and might make the fortune of some enterprising caterer who should provide it cheaply as an adjunct of salad. Oxygen has no smell; ozone smells like —, well, we will leave that to the imagination of the reader—not like heliotrope or rose. Oxygen has no action on gases, ammonia, phosphoretted hydrogen or muriatic acid, in its free state in the atmosphere; ozone acts strongly upon all these. Ozone colors litmus paper, ruins India rubber, tarnishes silver, bleaches; which are not powers of simple oxygen as it is found in the atmosphere. Dr. Andrews, who has made a study of it, says it is more than three times as heavy as oxygen, a difficult fact to prove. It colors metals with great force and rapidity, changes black to white in a compound of lead, yellow to red in a compound of potassium. It polarizes gold and platinum. Indeed, new experiments are revealing more properties of this energetic influence, and the scientific societies have in each meeting more wonderful things to say of it.—*Pettenkoffer.*

Fixing Pencil Drawings.—It is sometimes very desirable to fix delicate pencil or crayon drawings, and various methods have been suggested for the purpose of effecting this. Resinous varnishes are favorites with some people; the editor of the *Lens* advises the use of collodion, but these, although scientific and elegant, are troublesome and not always readily procured. One writer recommends the use of saliva, but this is filthy and disagreeable. A quarter of a century ago we were taught by our old drawing-master to fix pencil drawings by means of skim-milk, and this simple and easily-procured article leaves nothing to be desired. The milk must be thoroughly skimmed and freed from cream, or oily spots will make their appearance on the paper. The best mode of applying it is by means of a camel-hair brush, but a soft sponge or rag may be used where such a brush is not at hand.—*Industrial Monthly.*

Linseed Oil.—Linseed oil is obtained from flaxseed, by grinding the same under heavy stones, set on edge and made to revolve on beds of stone. Attached to the edge stone are scrapers, which throw the seed into the circular track of the roller. The ground seed is placed in strong, woven woolen bags, which bags are covered with mats made of horse hair and sole leather, of a proper and sufficient width to protect the bags in the operation of pressing. These mats with their contents are subjected to an immense hydraulic pressure, and the expressed oil flows off into large iron tanks, where it is allowed to settle. What remains in the bags after the pressure, is known as oil cake. About 8,000,000 gallons of linseed oil are used annually in the United States.

Sharpening Razors.—The following item is from our valued exchange, the Newark *Manufacturer*, on whose authority we reproduce it: It is said that the simplest method of sharpening a razor is to put it for half an hour in water to which one-twentieth of its weight of muriatic or sulphuric acid has been added, then lightly wipe it off, and after a few hours set it on a hone. The acid here supplies the place of a whetstone by corroding the whole surface uniformly, so that nothing further than a smooth polish is necessary. The process never injures good blades, while badly hardened ones are frequently improved by it.

Spontaneous Combustion of Hay.—From the observations and experiments of Prof. Ranke, it appears that the charcoal resulting from partial combustion of hay is pyrophoric, but under what conditions the hay can so increase in temperature as to form this charcoal, has not been established. Fermentation doubtless produces the heat, which cannot be dissipated, owing to the bad conducting power of the material.

Water-Proof Cement.—Soak plaster of Paris in a concentrated solution of alum, then dry it and bake in an oven at such a heat as is used to change gypsum or alabaster into plaster of Paris; then grind to powder and use with water like plaster. It is white, but may of course be colored; sets very quick, becomes very hard, so as to take a high polish, and is nearly as cheap as plaster of Paris.—*Manufacturer and Builder.*

Good Health.

The Human Frame.

No. 5—The Lungs.

The lungs are two extremely vascular, porous organs, situated in each of the lateral cavities of the chest, and separated from each other by the heart. In shape, each lung is conical, with the apex towards the upper portion of the thoracic cavity, which is the cavity formed by the bony frame-work of the ribs and dorsal vertebræ. They weigh ordinarily about three and one-half pounds troy; but so extremely spongy is their structure that, with only this comparatively light weight, they fill almost the entire cavity of the thorax. Externally, they are enveloped in a serous sack, the pleura, which is the seat of that common inflammation, pleurisy. Internally, they are lined with a very thin, delicate mucous membrane, through which the oxygen of the air and the carbonic acid of the blood pass during respiration. They are connected with the external air by means of the larynx and trachea; the former of which, a box-like organ situated at the base of the tongue, will be the subject of a future paper; the latter is a cartilageno-membranous tube, about four and one-half inches long, separating into two smaller tubes called bronchi, which go to the two lungs. These tubes again divide and sub-divide; their caliber constantly decreasing as their number increases, until they reach a diameter of about one twenty-fifth of an inch, when they terminate in little, curious shaped cells, which are again divided by partitions into tiny compartments of about one seventy-fifth of an inch in diameter. Into these little tubes and cells the air is drawn with each inspiration, where the thinness of the living membrane allows the blood circulating through this net-work of cells to be literally bathed in the air which furnishes the life-sustaining oxygen; while at each expiration that deadly product of our decaying tissues, carbonic acid, is expelled from the system.

It must not be supposed, however, that the entire amount of air in the lungs is changed with each respiratory movement; on the contrary, only some ten or twelve per cent. of the whole is renewed, which is called "tidal air;" the rest, or "residual air," remaining constantly in the lungs; so that it requires some ten or twelve inspirations to completely renew the air in these organs. A curiosity in respiration consists in minute hair-like bodies called ciliæ, which grow perpendicularly to the walls of the air passages, and which keep up a constant, waving motion always in the direction of the tracheæ, and thus, by the tiny currents they cause, assist materially in completely changing the impure for pure air.

The diseases of the lungs are numerous and formidable, and by the masses little understood. The hacking cough of incipient consumption is but too often mistaken for an ordinary cold; while, on the other hand, a chronic bronchitis, which is perfectly harmless compared with consumption, is mistaken for that malady, and the sufferer's life rendered miserable by groundless fears and nauseous nostrums. In the space allowed us here, it is impossible to even touch on this portion of our subject, so we will close with a few general hints on the care of these organs, which are as follows:

Close the mouth tightly, and breathe entirely through the nostrils whenever passing from a warm, moist air into that which is colder; as from a crowded assemblage into the open air, etc. This will warm the air thus breathed, reducing it nearer to the temperature of the lungs.

Avoid rooms too highly heated; especially where it is the result of crowding and packing. The warm, rarified air relaxes the lung tissue, and renders it doubly susceptible to injury. Avoid draughts, cold limbs, prolonged wetting, etc.; as anything which reduces the temperature and amount of blood at the surface of the body necessarily increases the amount sent to internal organs; thus rendering them liable to inflammation. The lungs usually suffer in these cases in four out of five instances; and a large majority of colds have their origin in this manner. Treat a common cold by hot foot baths, warm body baths, warm flannels, avoidance of exposure for a few days, comfortable clothing, and no drugs, unless there is constipation, when a simple cathartic may be given. Beyond a simple cold, consult a reliable physician; never tampering with quacks or patent nostrums.

Rice Water.—Take of rice two ounces; let it be well washed, and add to it water, two quarts. Boil it for an hour and a half, and then add sugar and nutmeg as much as may be required. To be taken *ad libitum*. Rice, when boiled for a considerable time, assumes a gelatinous form, and, mixed with milk, is a very excellent diet for children. It possesses, in some measure, a constipating property which may be increased by boiling the milk.—*The Druggist.*

Air and Bathing.—Children naturally weak should be compelled to play in the open air, and business men should leave work for a certain period each day and devote the same to exercise or other relaxation. Bathing is recommended in moderation as a check to consumptive tendencies. Surf bathing, however, should be cautiously indulged in by all predisposed to pulmonary difficulties.

Milk as a Diet and its Effect on the System.

There is considerable difference of opinion on the subject of a milk diet. It is surrounded with a mass of whims, of prejudices, and of mistaken ideas, which are based more on individual fancies than upon certain facts. To one a glass of milk imbibed is believed to be a sure provocation of a bilious attack; to another, a disordered stomach; to a third, drowsiness, and so on, through such a category of simple though disagreeable ailments that we look aghast at the farmer who drains cup after cup of the fresh pure liquid, time and again during the day, and wonder at the resisting powers which his organization must possess. The truth is, however, that milk is not unwholesome. On the contrary, it contains good substantial bone, muscle, flesh and brain-producing substances, which, assimilating, quickly act rapidly in building up the body. Naturally, we assert, it is nourishing; that it does bring on certain troubles is nevertheless true, but the cause is in the individual stomach, not in the milk, provided, of course, the latter be fresh and sweet.—*Scientific American.*

Milk diluted with one-third lime water, it is said, will not cause any one biliousness or headache, and, if taken regularly, will so strengthen the stomach as to banish these disorders. It may be taken with acid of some kind when it does not easily digest. The idea that milk must not be eaten with pickles is not an intelligent one, as milk curdles in the stomach nearly as soon as it is swallowed. When milk is constipating, as it is frequently found to be by persons who drink freely of it in the country in summer time, a little salt sprinkled in each glassful will prevent the difficulty. When it has an opposite effect, a few drops of brandy in each goblet of milk will obviate its purgative effect. As milk is so essential to the health of our bodies, it is well to consider when to take it, and how. It is a mistake to drink milk between meals, or with food at the table. In the former case it will destroy the appetite, and in the latter it is never proper to drink anything. After finishing each meal a goblet of pure milk should be drank; and if any one wishes to grow fleshy, a pint taken before retiring at night will soon cover the scrawniest bones. In cases of fever and summer complaint, milk is now given with excellent results. The idea that milk is "feverish" has exploded, and it is now the physician's great reliance in bringing through typhoid patients, or those in too low a state to be nourished by solid food.—*N. Y. Commercial Advertiser.*

Statistics of Intemperance.

The testimony of competent judges is decided in the opinion that the use of ardent spirits is hurtful to health and long life, and the old-fashioned calculations of Neison, in his *Vital Statistics*, are confirmed by the researches of the General Life Office. According to these estimates, the probability of death among drinkers between 21 and 40 years is ten times as much as among the whole population; between 41 and 60 years, four times as much; and among habitual tipplers over 60 years of age, twice as much as among the people at large. In England, 1850–59, more than 8,000 cases were reported of men who literally drank themselves to death. Neison has given us his investigations of 6,111 tipplers, that out of 1,000, 58.4 die annually, while out of 1,000 inhabitants of the same age only three die. Thus the mortality among drinkers is three times as great as in the community at large. He has carried out his calculations in all ages, and shown how this chronic self-murder marvelously diminishes the expectation of life. The highest point as to numbers is found in the years 1851-60, which report 192 men and 44 women intemperate out of 10,000 in England and Wales, and which reckon the diminution in the rate of expectation of life accordingly. This last statement is startling, and shows a falling off in the probable term of life for each 10 years, from 20 to 60, and upward, of respectively 28, 22, 17, 10 and five years, with fractions, and amounting to the fearful percentage, respectively, of 35, 38, 40, 51 and 63 per cent. of probable life, as compared with the population. Surely strong drink is slow fire, and intemperance is voluntary madness and chronic suicide.—*Harper's Monthly.*

In considering the best chances of a person having a tendency to consumption arriving at a good old age after a life of health, Dr. Bowditch discusses a few general topics and lays down a number of plain rules for sanitary guidance, which are mainly generally applicable to every one. Under the subdivision of residence, the first point urged is that the cellar should be always dry. No possibility should exist of drinking water becoming contaminated by refuse; and hence for the latter, closely cemented stone, brick or vitrified tile drains should be used, while the supply for drinking should be brought to the house from some distant spring or pond. The dwelling is best located on an elevated knoll, open to the south and west winds, but somewhat shielded from the north and east. There should be means of allowing sunlight to enter every room. As regards temperature, about 70° as a medium is the best, and this heat should be derived from open fire places connected with well constructed chimneys in every room.

Silence in the sick room is a splendid nurse.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

San Francisco:

Saturday Morning, July 11, 1874.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Improved Water-Wheel and Pressure Regulator; Giant Powder for Fishing; Academy of Sciences, 17. Who is this that Cometh from the North? Recent Patents; Society of Engineers of California; Patent Rivet Pocket Fastening, 24. Aaron's Amalgamation Process; English Companies and Titles to Mines; Primitive Methods of Quartz Crushing, 25. General News; Patents and Inventions, 28.

ILLUSTRATIONS.—Improved Water-Wheel and Pressure Regulator, 17. Trapiche, or Chilian Mill; Rude Arastra for Crushing Ore, 25.

CORRESPONDENCE.—How our Swamp Land may be Reclaimed; Foreign Corporations and American Mines, 18.

SCIENTIFIC PROGRESS.—Ozone—A New and Correct Method of Supply; Audible Safety Lamp; Sound; Facts and Fancies about Heat; The Moon and Vegetation; Naphthaline; Flame; Tellurium, 19.

MECHANICAL PROGRESS.—Making Match-Sticks; Metallic Floors; Fish Scale Ornaments; Steel Boilers; Lacquer; Coating Metals; Penholders, 19.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 20.

MINING SUMMARY from various counties in California, 20-21.

USEFUL INFORMATION.—Etching Iron; Preserving Iron; Preserving Wood with Tannin; Spurious Coins; Ozone; Fixing Pencil Drawings; Linseed Oil; Sharpening Razors; Spontaneous Combustion of Hay; Water-Proof Cement, 23.

GOOD HEALTH.—The Human Frame; Rice Water; Air and Bathing; Milk as a Diet and its Effect on the System; Statistics of Intemperance, 23.

MISCELLANEOUS.—Incombustible Paper; Cleopatra Ore, 18. Fair of State Agricultural Society, 1874; A Novel Cure for Dyspepsia; Prospecting; Idaho Mines; The Hazard Mine; Olive Growing; Protection to Game; Pioche Mines; Gold Mining; Accident at the Belcher; No Water in the Sun, 22. Selling Out; Plute District; Nevada County Mines; A Second Comstock Ledge; Alameda Coal Beds; A Word for Miners; Clearing Steam Pipes of Condensed Water; Saline Water and Lead Poisoning, 26. A New Enterprise; The Amador Consolidated Mine; Scientific Education; Alteration of Wines in Vats of Masonry; Butter Made by Steam, 27.

Removal.

July 13th, 1874, the business office of this Journal will be removed just one block east of our present location, to No. 224 Sansome Street, southeast corner of California, over the Bank of British Columbia, where we have secured large and elegant quarters. This removal is made in consequence of the sale of the building in which we are now located, to parties who will proceed immediately to demolish the present structure, and erect a new and magnificent block in its place.

BAR FORMED.—The waters of the Yuba have deposited an immense sand bar at the junction of the Yuba and Feather rivers. The bar extends straight across the Feather river, and is a formidable barrier to the passage of the waters.

WATER POWER.—The present manufacturing company, at Los Gatos, will not replace the woolen mill recently burned. The splendid water power should attract outside capital sufficient to restore the woolen enterprise.

SLUICE ROBBING.—According to the Idaho *World*, some Chinamen in the employ of the Buena Vista Bar company, cleaned the flume up lately in the absence of the watchman, and it is thought got away with about $2,000.

THERE is still a good deal of ore being taken out of the surface of the mines at Gold Hill, almost at the top of the ground. In this way the surface has been lowered 20 or 30 feet in many places.

CHARLES DURNING, an old and experienced mill man, has received the appointment of Superintendent of the mill of the El Dorado South Company, at Belmont.

THE Coos Bay and Oregon coal mine is to be properly opened immediately, under the supervision of Dr. Henry, the manager.

B. PHILBRICK has purchased ground in San Luis Obispo on which to erect an iron foundry and machine shop.

SIX hundred and forty men are at work for the railroad company at Sacramento.

"Who is this that Cometh from the North?"

The Comet! He is on his way,
And singing as he flies;
The whizzing planets shrink before
The specter of the skies;
Ah! well may regal orbs burn blue,
And satellites turn pale,
Ten million cubic miles of head,
Ten billion leagues of tail!

Thus sang Holmes of a big fellow of a comet which visited our solar system many years ago; and now "Who is this that cometh from the North?" may well be asked by every one who, as deepening twilight brings out the "starry hosts," turns his eye to the north, and there, amid the old familiar stars, beholds a stranger flaunting his fiery banner in the face of the venerable polar star, while "threatening a flank attack on the very nose of the celestial grizzly!" No wonder that such apparations have in past ages caused more or less consternation among people in the common walks of life, and perplexed and even frightened to desperate straits men of science, and powerful monarchs, even, with fears of physical or political change, or calamity. But in the presentage of enlightenment and astronomical research, these sublime wanderers in the infinity of space are having their motions defined, their paths mapped out, and their masses scientifically interrogated in such a manner that the scientists not only able to determine their approximate weights, but so to analyze their substance, as to determine the very elements of which they are composed, and their actual conditions of existence.

Instead of the present appearance, all imposing and majestic as it is or promises to become, being a cause of dread or fear, it is now welcomed as presenting a most unexpected and fortunate occasion to add a new and important leaf to the pages of science. How great is the joy, to-day, of the many patient night watchers on their lookout towers, at the appearance of this celestial visitor! The busy world at large, which has no taste or opportunity for holding snob intimate communion with the starry hosts, cannot indeed conceive of the extent of this joy; but all who have any general knowledge of the opportunity which is now for the first time presented to the astronomer of applying the recently devised instruments and newly discovered principles of research to this class of heavenly bodies, must feel a marked gratification at the probability of soon finding a new lesson in the science of astronomy, prepared and spread out by the patient star gazers for their leisurely and ready comprehension.

The present aerial perambulator promises to become the comet *par excellence* of perhaps the age. Although we know not whence he comes or whither he goes, his rapid increase of brilliancy and extent of caudal appendage, which his course evidently proves must yet be vastly increased, cannot fail to soon render it one of the most remarkable heavenly wanderers which have visited our system for many centuries—if, indeed, ever before. Its approach to the earth will be amply near for the most careful application, in all its details, of that most wonderful instrument, the spectroscope, which, in its present high state of improvement, has never before been applied to a comet, under anything like the present favorable circumstances.

Comets' Tails—What are They?

There is nothing about a comet, or in all nature, more mysterious than the appearance and motion of the tail or train of a comet. Theories by scores, and wild enough to make one's hair stand on end, have been suggested to account for these phenomena, but almost invariably the propounders soon find themselves utterly disregarding all the workings of known physical laws, and are compelled, one after another, to abandon the theories they have conceived.

When a comet is first seen by the telescope in the far off regions of space, it is generally without any tail. That appendage is developed and grows more and more conspicuous as the body approaches the central luminary, and is always observed upon the side opposite to the sun, or pointing away from it.

Of what does that appendage consist? Is it matter? If so how can we account for the inconceivable rapidity of its motion, especially when "swinging round the circle" at its perihelion passage. If these appendages do consist of matter, emitted from the comet's body, it must be under the control of forces incomparably more energetic than gravitation, and of a nature entirely different. Professor Pierce and Prof. Bessel have each, independently of the other, offered the suggestion that they may consist of electricity. Some have supposed they might be simply the result of light—that the sun's rays, in their passage through the unknown substance of the nucleus of the comet, may acquire some new power, analagous perhaps, to polarization, by which they become visible; while those rays which simply penetrate space, are, as we know, invisible. This latter theory has received a powerful impetus in connection with some marvelous results which Prof. Tyndall has obtained in his researches upon the actinic power of light. By passing a beam of light through a certain chemical substance—the vapor of liquid, hydrochloric acid—the Professor found that in even the most attenuated form to which he could reduce the amount of that vapor, a luminous white actinic cloud was formed, resembling in all known respects and phenomena the substance of the tail of a comet—and particularly in its absolute transparency and luminosity. The cloud, which was formed within a glass tube, did not present the smallest conceivable obscuration to any object placed behind it. And still the cloud itself gave off a large amount of light. Nothing could give a better idea of the substance of the tail of a comet than such an actinic cloud.

The Phenomena Explained.

The application of Professor Tyndall's discovery to the explanation of the cometary principle under discussion is as follows: A comet is held to be a mass of vapor, decomposable by solar light—the tail being an actinic cloud, resulting from such decomposition, and projected into space. The tail is therefore not matter projected from the comet, but simply a beam of *actinic light* (the other rays being mostly absorbed by the comet) projected from the sun into space, and upon which interplanetary matter, or cosmic dust, is precipitated, and thus made visible, precisely as the atoms of dust are made visible by a beam of light passing through a dark room.

This explanation, of course, supposes that the sunlight has a different power, on being passed through a vapory comet, from that which it possesses when it has not traversed such a medium; otherwise all space would be lit up like a comet's tail. It seems to be the *actinic* rays alone which possess this power, the other rays being absorbed by the vapory mass upon which they have fallen, rendering that mass even more bright than the cosmic dust illuminated in the track of the penetrating actinic rays. Thus the caudal appendage of a comet is in a perpetual state of renovation, as is a beam of light thrown into a dark room by means of a movable lens. The beam of light only is in motion, not necessarily the particles of dust, either in the room or in space.

Nearly all the phenomena observed in these mysterious bodies are readily accounted for by Professor Tyndall's theory, which will undoubtedly be carefully studied, and, if possible, verified during the continuance of the present illustrious stranger within our reach of vision.

Society of Engineers of California.

The regular monthly meeting of the Society of Engineers of California was held on Tuesday evening last, President Allardt, C. E., in the chair. The attendance was quite large and considerable interest was manifested in the proceedings. The principal feature of the meeting was the paper "On the Mechanical Condensation of Vapors" by James R. Smedberg, consulting engineer of the San Francisco Gas Light Company. Mr. Smedberg's paper first considered the physical structure of vapors themselves, at some length. He next considered the mechanical condenser of Messrs. Pelouze & Audoin, which is based upon Halley's vesicular theory, and whose second and subsequent plates, or "plates of percussion" as they may be appropriately termed, open up the possibility of many uses by the mechanical engineer. Mr. Smedberg exhibited models of a plate condenser, remarking upon the direction of flow and compact arrangement of the machine. This condenser is derived from that of Pelouze and Audoin; but has no feature in common with it except the vital one of the percussion plates, and that of the moving drum.

The attention of the audience was then called to the practical effect of the latter machine in liquefying the viscous and obstinate coal-gas vapors; and the paper closed with one or two speculations as to the value of the instrument in purging other vapors of their entangled vapors. In this connection, Mr. Smedberg suggested that the vapors of mercury might be condensed on the same principle as this condenser operates, viz: by impact. He also made some suggestions regarding the utility of the principle if applied to the drying of steam of ordinary tension. His remarks on the latter subject occasioned some little discussion among the members of the Society. He gave an instance in support of the grounds he took as follows: Mr. E. F. Molera, Assistant United States Light House Engineer, justly attributing the lack of sonorousness of certain fog horns on this coast, to the presence of water in the steam used to sound them, caused a plate perforated with small apertures to be thrown horizontally across the base of the dome of the supplying boiler. The suspended molecules of liquid water, were, of course, brought more or less completely into contact as the steam passed through these restricting apertures, and a far drier and more elastic vapor was thus passed into the horn. The useful effect was greatly increased at a stroke, as its valuable warning was found to cover a circle of more than double its previous range.

Mr. Smedberg's paper described in detail an improvement of his on the principle brought forward by Messrs. Pelouze and Audoin, of the condensation of vapors by percussion of its molecules. Mechanical difficulties have heretofore prevented its operation, but Mr. Smedberg has overcome these obstacles and perfected a machine which will be of great use in gas works. We regret that want of space forbids our giving even a synopsis of the valuable and interesting paper.

A DISPATCH, dated July 2d, states that the Abbott Co. have struck a new deposit of cinnabar, which promises to be something grand.

Patent Rivet Pocket Fastening.

Alfred Rix, a well-known San Francisco lawyer, and M. A. Wheaton, a noted patent lawyer, are now in Austin taking testimony in regard to who first invented the patent riveted overalls. A large amount of money is dependent on the issue, one heavy San Francisco firm having sued another for damages for infringement of patent, for which the plaintiff paid the sum of $20,000 and refused an offer of $150,000. The evidence taken before United States Commissioner Shannon at Austin tends to show that the article is no novelty at all—a humble tinsmith, Billy Rowe by name, in the employ of Smith & Starratt of that place, having been engaged in riveting overalls with the same rivets and in the same manner for years past, which fact will probably invalidate the patent—on the ground that the riveting is no novelty—and anybody can wear riveted overalls without the "$2 per ton royalty."—*Exchange.*

Our exchange probably is not aware that the recent decisions of our United States Courts do not justify its statement that the above "fact will probably invalidate the patent." On the other hand we very much doubt the possibility of defeating the patent referred to by the "facts" stated above. It is always easy to find some one who is willing to swear to prior use after an inventor has made a success of his invention. If the party referred to, "Billy Rowe by name," has used the invention for the past five years the said "Billy Rowe by name" is a very foolish "Billy Rowe" that he didn't secure a patent on it and reap the advantage which the patentee is now doing. If "Billy Rowe" did casually fasten pockets with rivets it is very evident that he did not make an invention. If he did he didn't know it or he undoubtedly would have secured a patent on it. Davis, the patentee, was an independent inventor and, being also a sensible man, he did what any sensible inventor would do—secured his invention by patenting it. Further, after securing his patent he has succeeded so far in making a success that his riveted overalls have driven all of the common overalls out of the market; and the consequence is, he has the combined capital and influence of our wholesale clothing merchants pitted against him. No wonder under such circumstances that they were able to find some one willing to testify that he has made the article for several years. We believe Davis has a good and substantial patent.

Recent Patents.

Among the patents recently obtained through Dewey & Co's., MINING AND SCIENTIFIC PRESS, American and Foreign Patent Agency, the following are worthy of mention:

UNLOADING HEADER WAGONS.—Henry Klehn, Crow's Landing, Cal. An improvement in that class of false bottoms for header wagons, in which the load is lifted bodily, as in a sack, from the wagon. Consists in making the false bottom or netting in two parts, which are united on the under side of the load by a detaching apparatus. To deposit the load, a pull upon a cord releases the apparatus, so that the bottom opens and allows the load to fall out.

CAN OPENER.—A. H. and C. J. Hall, Suisun city, Cal. This patent covers a simple and cheap device for cutting open the tops of tin cans, and consists of a cutting roller mounted upon a shank at the end of which is a prong. The prong is stabbed through the center of the can top, and serves a fulcrum about which the shank is operated while the cutter cuts out the top of the can in a circle.

BRAKE SHOE.—Henry C. Deering, Hope Valley, Cal. Covers an arrangement for applying and securing a rubbing face on the contact side of a brake shoe. The device consists of two straps which are hinged at the opposite corners of one end of the block, so as to shut down against the opposite edges of the block, and clamp the face or rubbing piece to the block, leaving a sufficient space between the straps for the rim of the wheel to bear.

ANIMAL TRAP.—Aug. M. Gass, Campo, Cal. This patent relates to a very simple and cheap, yet effective trap for catching gophers, squirrels and other animals.

TAP AND FAUCET FOR BEER CASKS.—Jno. G Schiffer, S. F., Cal. Relates to an arrangement for tapping beer barrels without danger of losing the contents. Consists of a faucet provided with a driving spindle. A metal bung with central opening is permanently secured in the barrel head, the faucet can be screwed into this bung. A wooden plug is secured in the opening before the beer is placed in the barrel; when the barrel is to be tapped, the faucet is screwed into the bung, and the wooden plug driven into the barrel by striking the projecting end of the spindle.

TICKET CLASP.—Hiram N. Rucker, Plainsburg, Cal. This patent covers a very neat and useful clasp for holding tickets, and is intended for the use of conductors, passengers and other persons who carry cards or tickets about their persons. It consists of a box for holding the ticket or card, which is made in two parts. These parts are so united that they can slide upon each other, in order to increase or diminish the size of the holder to accommodate any sized card or ticket.

Aaron's Amalgamation Process.—No. 2.

[Written for the Press by the Inventor.]

Chemical Treatment.

The similarity between this process and the fondo consists in the action of the copper chlorides on silver compounds and the reduction of resulting silver salt by metallic copper. There the resemblance begins and ends. The modification of the chemical treatment, the complete change in mechanical means, above all, the vastly greater economy in mercury, give it a title to be considered a distinct process.

The essential "chemical" is copper dichloride. The protochloride acts equally well on the ore, but it also acts injuriously on mercury. Moreover, it is inevitably reduced to dichloride in the course of working.

When the ore contains no copper oxide or carbonate, or not sufficient, it is best to prepare the dichloride by boiling, by means of a jet of steam, in a wooden vat containing scrap copper, a solution of copper sulphate, and sodium chloride (salt), till the color of the solution is no longer green, but brown; and a little of it, cooled in a test tube, deposits a copious white precipitate. Or, a solution of copper sulphate and salt may be boiled with just enough iron borings to precipitate one-half of the copper in the solution. When the precipitated copper is re-dissolved, the dichloride is formed. The solution must contain an excess of salt above the quantity requisite to convert the copper sulphate to chloride; and, if not used immediately, should be kept secluded from the air, to prevent its conversion to insoluble oxichloride. A little of the latter may, however, be beneficial in some cases.

It will answer, though not so well, to put the copper sulphate and salt directly into the amalgamating barrel, with the pulp; either leaving the copper balls, which are always used in the barrel, to do the work of forming the dichloride, or adding the proper quantity of iron borings. It must be observed that when iron boringe are used for this purpose, double as much copper sulphate is required as when copper is used. A "sodic chloride of copper" may be made in the dry way, but this does not seem to be convenient.

With ores containing copper in the form of oxide, or carbonate, a solution of sulphurous acid in water, with the addition of salt, produces copper dichloride at very little cost. This method is patented. The next best way, which is now used in Mono county, is to add to the pulp in the barrel a quantity of iron protosulphate (copperas) and salt, producing iron protochloride, which, reacting on copper carbonate in the ore, forms a mixture of copper protochloride and dichloride; thus, $3CuOCO^2+2FeCl=CuCl+Cu^2Cl+Fe^2O^3+3CO^2$.

Acids may be used with this class of ores in conjunction with salt, but as they are disagreeable to handle, and produce only copper protochloride, they are not preferable, unless when the ore contains copper dinoxide, in which case I presume sulphuric acid might be used with advantage. Salt, in excess of the quantity decomposed by the chemicals, is always necessary. The copper and iron sulphates require rather more than half their weight of salt to convert them into chlorides, and at least 50 pounds more should be used to a ton of ore. From 5 to 50 pounds of copper sulphate, or its equivalent of the other substances, will generally be found sufficient.

In whatever way the copper dichloride is finally obtained, there must be enough of it dissolved in the hot pulp to show a distinct coat of copper on a clean piece of iron.

With the class of ores just mentioned, containing copper, it is usual to put in, together with the chemicals, a quantity of iron borings. It acts by precipitating rapidly an equivalent of cement copper, at the same time producing iron chloride, which dissolves an equal quantity of copper from the ore.

The precipitated copper acts in two ways. First by reducing to dichloride any copper protochloride which may be present; second, by reducing to metallic state the silver salt formed by the action of copper chlorides on the ore. This silver salt, if not a simple chloride, is so far similar as to be reducible by copper; for which reason, as the quantity of iron could not be accurately adjusted, and moreover, an excess of copper is necessary in practice, a quantity of metallic copper, usually in the form of balls, or small bars, is used in the amalgamating barrel.

The quantity of iron borings which may be used with advantage may be as much as 50 pounds per ton of ore, varying with the quality of the ore and the kind and quantity of chemicals. Its effect is to hasten the operation, to protect the mercury which unavoidably may remain in the barrel when discharged, and to economize the consumption of the copper balls. Its use must be regulated by the quality of amalgam obtained, as too much causes the production of coppery bullion.

Mercury should not be put in till several hours after charging, except when the copper dichloride is made beforehand, or when, with copperous ore, the solution of sulphurous acid is used; in these cases there is no danger of its being granulated.

Authorities differ as to the manner in which copper chlorides act upon silver ore. Some even doubt if silver chloride is formed, but it seems singular that they all speak of silver sulphide only. My own experiments show; 1st, that silver sulphide (natural) is reduced to metallic silver by copper oxychloride; 2d, that silver sulphide (artificial) is converted to chloride, by copper chloride and dichloride; 3rd, that quartzite digested with copper chloride, dichloride, or oxychloride and salt, produces a solution of silver, and yields nearly all it contains to leaching with sodium hyposulphite. I also find that calomel acts on silver ores. As to the reduction of calomel by copper subsulphids, which Gratzner says takes place thus, $HgCl_2+Cu_2S=CuCl+CuS+2Hg$, I have not been able to verify it, as on digesting calomel with copper glance (natural), I obtained copper dichloride and no metallic mercury.

English Companies and Titles to Mines.

The letter of Mr. Lewis Chalmers, on the subject of "Foreign Corporations and American Mines," published in another column of this issue, brings before us some questions of great importance to the mining community.

TRAPICHE, OR CHILIAN MILL.

The discussion of these questions at the present time is especially important, inasmuch as Congress meets again in December, and the various new mining bills will again come up for consideration. While amendments to the mining law are in order, some of our Pacific Coast Congressmen should introduce a paragraph in the mining law of the United States, which would allow foreigners to protect the mines they have bought in their own names.

Surely, as Mr. Chalmers says, these foreign corporations are in a peculiar position—they can not get a patent legitimately, if they want to. If either of the proposed bills, compelling miners to patent their claims, passes Congress, then the position of these foreign companies will be still more embarrassing, since the bill says they must apply for a patent, and the mining law contains no provision by which they may do so. However, the instructions from the Commissioner, accompanying the mining law, say that proof of citizenship is required, but where the applicant is a corporation, a copy of their charter or certificate of incorporation may be filed in lieu of evidence of citizenship. Whether these foreign companies could apply for a patent by this clause, is a question for a competent lawyer to decide; but they probably cannot, since those who have patented their claims, under the Act of May 10th, 1872, have been compelled to transfer their property temporarily to an American citizen. No company likes to do this, for it is a risky business to transfer property worth thousands of dollars, even for a short time. We have heard of one instance at least where the company was made to suffer severely, from lack of honesty in the party to whom the transfer was made.

Of course, those foreign companies buying mining property now are safe, since they can insist on a patent before purchase, but those companies owning ground bought before the passage of the Act of May 10th, 1872, are unable to procure a legal title to their mines legitimately. The Government of the United States ought to put beyond all question the title to the property bought by the English and other foreign companies, where they are doing a great deal to develop the mining resources of the country. They have sent their capital freely and, we are sorry to say, have not as yet made much out of their investments here. Be that as it may, those that are here ought to be protected in their rights fully, and the Government should take such steps as are necessary to do so.

While pursuing the inquiry into this subject, there is also another one to look into of importance to us all. We ought to know definately the *status* of these "Limited" companies, of which there are so many on this coast. We see the term on their letter heads, business signs, and always tacked on whenever the company is mentioned. It is "limited liability," of course, but how it stands in the eyes of the law of this country is a question. If the trustees are only liable for the amount they invest, in the paid up capital, when that is exhausted, who is responsible? There are so many companies of this class in our midst at present that the subject is of interest, and we shall deal with it more in detail at a future time. Perhaps some of our readers will favor us with their views on the matters spoken of above.

RUDE ARASTRA FOR CRUSHING ORE.

AUTOMATIC RAILWAY SWITCH.—A patent has been granted to Pierre Bourgeon, of this city, for an improved device for operating railway switches, by which the car, as it approaches the switch, will automatically throw the switch rail so as to make the desired connections with the proper track. Mr. Bourgeon is desirous of communicating with any company or party who would be willing to become interested in its introduction. Any communication addressed to Charles Moise, agent, at No. 335 Montgomery street, this city, will meet with attention.

THE MECHANICS' INSTITUTE FAIR matters are going on favorably. The managers are very busy arranging details of no special interest to the public. The programme of the opening day has been so far fixed upon as to select Col. W. H. L. Barnes as the orator of the day.

THE Bull creek diggings, Butte county, are paying from $2 50 to $50 to the hand per day. The miners complain of a scarcity of water.

CHARIOT. — $12,000 was received at San Diego Thursday from the Chariot mine, the result of eighteen days' run of ten stamps.

Primitive Method of Quartz Crushing.

In our issue of June 27th, we gave an illustration of the method of crushing ore by the old Mexican process, which was probably the first step above breaking it with hammers. This week we produce two engravings, one of the Chilian mill and the other of an arrastra, both primitive methods of quartz crushing.

The Chilian mill, or *trapiche*, shown in the upper cut, is not so common in this country as the arrastra. It consists of a vertical runner, frequently of granite, revolving on a horizontal arm projecting from a perpendicular shaft, to which motion is given by either water or steam, but usually by horse power. The basin in which the runner revolves is usually slightly conical and is made of stone, though sometimes of cast-iron. In this arrangement the grinding area is regulated by the difference of the circumference of the circles described on the bed stones, by the inner and outer edges of the runner. In the majority of cases the Chilian mill has two runners instead of one, so that there is one runner on each side of the vertical shaft; and in such mills that are fastened to the shaft at different distances from the center. The method of working by this mill is similar to that of the arrastra; but the latter is a much more efficient machine. Mr. Darlington describes in "Ure's Dictionary" the size, etc., of a Chilian mill in Constanti, Spain, as follows: Diameter of edge runner, 6 feet; width of edge runner, center, 20 inches, edge 16 inches; weight of edge runner, 3 tons, 15 cwt.; speed of runner, 200 feet per minute; diameter of inner circle, 4 feet; size of stuff previous to being ground, 10 holes to lineal inch; size after leaving mill, 60 holes to lineal inch; quantity of stuff reduced in 10 hours, 350 lbs.; horse power employed, 7.

The lower cut shows an old-fashioned Mexican arrastra. Those in use in this country vary somewhat in detail, and in some cases two and even four horses are employed. The whole of the space within the circle, except where the upright pole in the center is placed, is available for crushing space, and two, four, six or eight drags are used, according to the size of arrastra and number of horses employed. The arrastra works slowly, and consumes a large amount of power in proportion to the work it accomplishes, but is a first-rate amalgamator, better even than it is given credit for. It is used on this coast now, even more than formerly, for testing new discoveries, when they are at a distance from custom mills, and is of great value for that purpose. We venture the assertion, that if this simple arrangement had been used oftener, it would have saved millions of dollars which have been wasted; since in many cases expensive mills have been erected to work a class of ore which a simple arrastra would have proved worthless.

In building an arrastra a circular pavement of stone, 12 or 14 feet in diameter, is laid, on which the quartz is ground by means of two or more large stones or mullers, dragged continually over its surface, either by horses or mules, but more frequently by the latter. The periphery of the circle is surrounded by a curbing of wood or flat stones, forming a kind of tub about two feet deep. In its center is a short, wooden post, firmly imbedded in the gravel. Working on an iron pivot in the central part is a strong, upright, wooden shaft, secured at its upper extremity to a horizontal beam by another journal, which is often merely a prolongation of the shaft itself. This upright shaft is crossed at right angles by two strong pieces of wood forming four arms, of which one is made sufficiently long to admit of attaching two mules for working the machine. The grinding is performed by large blocks of hard stone, attached to the arms by chains or thongs of rawhide, in such a way that their edges, in the direction of their motion, are raised about an inch from the stone pavement, while the other side trails upon it. These stones weigh from two to four hundred pounds.

Some arrastras, for testing quartz veins, are readily put together, like the one shown in the cut, the bottom being of unhewn flat stone laid down in clay; but in a well constructed arrastra, intended to be permanently employed, the stones are carefully dressed and closely jointed and grouted in with hydraulic cement. The ore is broken up into small pieces and placed in the arrastra. Where fuel is plenty the rock is burned and slacked, as this facilitates the operation of crushing. The machine is set in motion, water is admitted, and in the course of time a thick, pasty mass is formed. As the ore becomes finer quicksilver is added, and after that the grinding is continued until it is thoroughly mixed with the pulp. When amalgamation is considered complete, water is added to thin down the pulp, the tailings are drawn off and the amalgam and heavy particles settle down to the bottom. Another charge is then added, and the process is repeated until it is necessary to clean up.

THE Rocky Mountain Co. have decided to discontinue the shipment of coal to Virginia City, owing to an increase in the railroad freighting rates.

THE acid factory of Rice & Duffy, of Carson City, was burned on Saturday last. Loss, $25,000. It will be rebuilt immediately.

THE Phœnix quicksilver mine in Napa county has declared a dividend of $3 per share. It is proposed to do the same monthly for the future.

Selling Out.

The *Mountain Democrat* contains the following truthful article, which we commend to the attention of onr mining readers: In our last issue, commenting on n letter from our Spanish Flat correspondent, we tried to present some of the reasons why our section has failed to make progress propertionate to its evident capabilities and advantages, and why many of our old residents lack confidence nnd energy for works of development. There are some other difficulties, which may be best illnstrated by examples which have fallen within the range of a 20 years' residence in the foothills and mountain regions of California.

One obstacle to the development of this section and contentment or patient effort on the part of old residents, is what we choose to call the "sell-out sentiment." This sentiment is a relic of the "finsh-times" mining era. In the breast of your pioneer miner, so long as he sticks to the old stamping grounnd, it is chronic and incurable. Transplant him, and in many instances the cure is instantaneous. The old miner, in his familiar haunts, never values his possessions according to their yield. nor according to the comforts or blessings by which they do or might surro und him, but only according to the price for wbich he can "sell out." A gravel claim may yield an ounce a day; a quartz ledge may prospect $50 a ton; a tract of land may yield or be capable of yielding huudreds of dollnrs per acre per annnm; his home may be as salubrious, as fertile, as delightful in every respect as the fabled Eden or Elysium, but none of these have the slightest value in his estimation, unless he can "sell out." If nobody wants to buy his property, it is valuelese, and he is wretched and hopeless. If anybody dops happen to want to buy it, he generally doubles or quadruples the price they are willing to pay, and thirteen times out of a dozen won't sell unless he is absolutely certain, or thinks he is, tbat the price offered is more than the property can possibly be worth. He won't develop property, for fear he can't sell out afterwards; he must be convinced that he is gouging a stranger, or he won't sell out to him. But if you once can get him sold out and removed from his old haunts, all of these peculiarities vanish, and he generally develops into an enterprising, driviug, successful citizen. We will ventnre an example or two.

George B. was a pioneer locator in a rich mining camp. He was full of energy and soon had control of the butchering bnsiness and the principal stopping place for teamsters and travelers. Money poured in like water. His liberality and public spirit were equal to his energy and prosperity, and he was ever foremost in contributions for any scheme to improve the locality; nssisted libersslly iu running tunnels, "staking" prospectors, etc. In the course of time the placer diggings were worked out, the population became reduced, business ran down, and George, while struggling still with an opeu and free hand, against the adverse current, found himself thrown high and dry with nothing left but the old traveler's rest nnd teamster's home, the travelers and teamsters all "gone where the woodbine twineth." But the old estahlishment was a roomy, commodious and substantial strncture, splendidly bnilt, hard-finished throughout, two stories high, with a spacions cellar uuderneath, hewn out of the solid rock. In his "hours of ease" George had, chiefly by way of diversion, occasionally turned impecunious stragglers and hangers-on to aocount in plantingtrees, vines, shrubs, etc., aronnd his house. Thus the revulsion found the premises studded with some thousands of unconsidered vines, fruit and ornamental trees, berry patches, etc., to say nothing of a glorious well of clear and ice-cold water. Tbough the teamster and traveler business was gone, their old rendezvous was still a lovely place. But in the first years of depression George couldu't, no matter how hard he tried, "sell out" the entire place for much more than the doors and windows in the house were worth. He measured and deplored his downfall, not by what the place was worth, but by what he couldn't get for it. He couldu't "sell out," therefore it was worthless. While he was in this mood, an old Germau, who had slowly laid up a little money by labórious teaming, took a fsnoy to the place and commenced negotiations for its purchase. Before he came along, George would nave jumped at a $1,000 for tbe place, but as soon as a purchaser appeared he commenced a different kind of jumping, a jumping to this and that higher price, until he thought that he had "socked it to the old Dutchman good and heavy" when he sold him the place for $3,500. The next year the "old Dntcbman" realized half the cost of the place, besides furnishing his family a comfortable home and maintenance; the secoud year he deposited $2,500 in bank from the profits on its products; the third year he sold $5,400 from the produce of that place, whioh is reliable for a permanent income of $5,000 per annum. George, who would never have made an effort to do anything with tbat place, went off to a remote portion of the State, of which he has become one of the most enterprising and flourishing residents. The change was beneficial to all concerned and to the commonwealth.

Oue more case: Henry —— had prospered at blacksmithing and mining. He had a two-story brick house, splendid surroundings, was comfortable and doing well. But the town in which he lived had run down. He became fearful that he couldn't "sell out" if he stayed much longer. Therefore he sold for a few hundred dollars and went to Oakland, where he can make but little, if any, more at his trade, and where he cannot for less than tens of thonsands of dollars supply himself and family with the same comforts that he sold in the monntains for a few hnndreds.

Plute District.

The Inyo *Independent* says: We have several times referred to this as yet unknown but promising district. It is located, as we have before stated, on the western slope of the White mountains, à little east of uorth and about 12 miles distant from Sneden's on Bishop creek. Good mineral bearing lodes are to be seen in every portion of the district, and from the aocounts we hnve of some of them we readily believe it offers a first-rate field for mining men. John Westerville, Page and others made locations and did some work there 11 years ago, and at that time found notices dating back three years, or to 1860. These parties incorporated a company inclnding two mines known as the Maranthan and Ancho. One E. C. McComb was Secretary, and managed things so well that the company were soon all frozen out, since which time until recently nothing has been done in the district. At that time these parties considered themselves in possession of fortunes, as the ledges were of fair size and prospected splendidly, hut for reasons hinted at above everything was allowed to lapse into idleness. Later locators have demonstrated the trnth of these legends. They find an abundance of gold ores, which by actual working in the arrastra at Fish springs yielded $63 to the ton. This is from an 18-inch ledge known as the Golden Era, all of that kind of ore. Another, a silver galena ledge called the Babe, yields a splendid looking ore of the smelting class; it carries 54 per cent. of lead and $709 in silver, average assay value. This ledge plainly connects with a monster ledge 300 feet distant. The latter, some 12 feet wide, extends for several hundred yards. It shows some galena, but is principally a kind of an iron quartz, of little or no value so far ns surface tests will determine. The shaft on the Babe is only 12 feet deep, nnd that is the deepest in the district; it helongs to W. Keplinger, A. Doss, T. M. Brady and James Morris, who are workiug away on it, satisfied that it is a hig thing, as the ore from it, exhibited to us hy Mr. Morris, certainly indicates. These parties, with others, are at work constrncting an arrastra, which will he ready to run in ahout three weeks. Should this prove measurably successful, as we donbt not it will, Piute district will begin to attract the attention its very flattering surface indicatious so strougly invite.

Nevada County Mines.

The Nevadn *Transcript* pertinently says: The mines of this county are all at work, and have been employing all the men that could be worked to advantage throughout the season. Many new mines have been oponed, and the result is that the gold yield is much greater this year than for many years. We understand that up to the end of this month, the shipments exceed those of last year for the same length of time over $400,000. The present month exceeds those of the same month of last year over $70,000. This speaks well for the district and proves whst we have repeatedly said, that mining was never more prosperous about here than at the present time. The new mines being developed and the number of ledges being prospected give proof that the yield will continue to increase, and the next yenr may safely be expected to exceed the shipments of this yesr as much as this year exceeds last. There nre new ditches and tunnels being run into new fields where gold is known to exist in large quantities, and new ground is going to be opened in several places in the county, which, taken altogether, give the brightest prospects for the future. If the whole yield of tue county could be accurately obtained, and we hope to obtain it before long, it would surprise those unacquainted with the county. When these figures are given, they will prove Nevada the banner mining county of the State.

A Second Comstock Ledge.—Over a year ago, when a gold and silver quartz vein was discovered in St. Helena mountain, five or six miles from this place, the mining men of the State said that the Coast Range contained no auriferous quartz in paying quantities, and that the mine would prove to be only a surface spur. The energy and money of the Calistoga Silver Mining Company have entirely disproved this exploded theory. A tunnel has been run into the mountain at a point where the ledge crops out boldly, and all the distance in pay ore. A level of nearly three hundred feet has been attained in six feet of ledge matter that assays from $300 to $400 per ton. The mine is open to all visitors, who help themselves to specimens of the ore, and in all oases the retorts far exceed their nticipations. We were skeptical ourselves until occular proof carried conviction as to tho great value of this wonderful discovery. The open manner in which the mine is being worked, aud the freedom ehown to all persons inclined to examine the ledge, disprove the idea advocated by a few that this is nothing more than another grand "stock operation." The owners are all well known, and repntable gentlemen. They inform us that none of the stock will he offered for sale until the mill is in full operation, and the results of the milling known.—*Calistoga Press.*

The Dutch have met with a severe reverse at Sumatra—in fact their expedition has been well nigh destroyed.

Alameda Coal Beds.

A great deal of attention has been paid of late to the discovery of coal in this county. For nine years past pieces of coal have heen fonnd in the ravines and oreeks by different parties, who have reported the facts from time to time; this has led to often repeated prospectings by amatenr miners, which have invariably resulted unsuocessfully, for the reason that prospecting has been confined too near the eurface, and when small seams have been brought to light and samples presented to experts and geologists, they have emphatically pronounced it folly to follow up these seams, one and all declaring that the strata and formations are snch as to preclnde discovery of the much needed mineral. Examples are held up of Mt. Diablo and other bituminous regions, their stratifications, etc., and at one time we were told that coal did not exist in California. To refute these assertions, not being ourselvee mining experts or practical geologists, we think proper to present the views of an experienced coal miner, who has at various times made the suggestions upon which this article is based.

The region of Mt. Diablo is different from that of the foothills of the Coast Range, the former being clssed as mesozoic and oretsceous formation, whilst in the latter daily proofs are being given to show that it belongs to the mesozoio and palæozoio, with csrhoniferons formation. The strata of the former run differently from those of the latter. The coal strata of the H. A. mine runs southeast and northwest; that of the Black Hawk, near Niles' station, now being prospected, follows the same direction, and in the Hayhn mine, nine miles north from here, the strata maintain the same course, with the seams of coal in each case running perpendicular without any dip so far as explored—110 feet deep—and the coal veins have increased from one inch to twenty-four inches in thie depth. The increase of coal in the H. A. mine has more than trebled since it was opened, and each week's work is more favorable for oosl in psying quantities. Such English miners as are now at work express themselves positive of striking a coal bed within 15 to 30 feet further in depth. The opinion is expressed actually from experience in the coal mines of their native lnnd, and they speak of the present millstone and lime formation as being similar to the coal covering of otber mines.

Before the opening of this shaft, it was said that no real coal existed in this State; that it was only bitumen that had heen found. The coal of this mine has been tested, and npon examination it proves to be almost an exact counterpart of the Cumberland coal, being somewhat lighter in color and weight—a first-rate article for blacksmith's use. Regarding the stratam passed through in the shaft of this mine, the first was soil; next came a hard sandstone followed by hard clay, slate and clay with gypsum. This has been followed by millstone grit and lime formation, all badly shattered, probably by the upheaval of some great earthqnake, and throngh the formations run the coal veins and seams, followed down as near perpendicnlar as a plnmb line the whole width and depth of the shaft.

The most skeptical, upon visiting the different mining localities of our county, must acknowledge that we have coal of a superior quality, and it needs only a little energy on the part of our people to supply the capital with which to develop our mines and rednce our present heavy expenses in fnel.

The theory advanced that the altitude is greater than that of Santa Cruz and Santa Barbara, that our foot-hills cover large beds of coal formed from marine plants, and that our seams run in the direction of the before-mentioned places, and that the asphaltnm formations derive their being from here, that the coal oil which escapes off the harbor of Santa Barbara runs from our beds of coal, which extend to the next county, may appear ridiculous to eome; but it is firmly believed in by many of onr intelligent miners, who have little faith in the geologists of this State, as their experience has shown them that in this conntry nearly all such theories fail, and practice alone perfects. Coal oil has been found in small quantities in different places, as for example, at "Currel Place," and in the pasture on the Redwood road a few miles from Haywood; this is also suggestive of coal in the vicinity.

Let tho circumstances be as they may as to coal existiug in this stratnm or not, that is of very little importance at this time, for coal has been discovered in this county in many places; the best, however, so far, is that of the H. A. mine, and none differ in opinion as to its being the best coal yet found on the Pacific Coast. Each day's development brings forth more positive proof of the desired quantity, and of the shareholders being remunerated for tbe ontlay; and we consider the enccess of this undertaking as one of the most important to the interests of this county, as a fully developed, paying coal mine will instigate the opening of others in different placee along our coast foot-hills. As the present stratnm of coal has been traced from Fruit Vale to Washington Corners, we eee no reason to doubt that another class of indnstry will be added to our many othere, and will bring to our side of the bay much of the manufacturing interests of the State, and add largely to the resources of the commonwealth. —*Alameda Advocate.*

The Rhode Island Legislature has adjourned to meet January next, without electing a United States Senator.

A Word for Miners.

The yield of gold and silver on the Pacifio slope during the past 25 years amounts to $1,583,644,934. Of thie snm California produced $1,094,919,098; Nevada, $221,402,412; Utah, $18,527,537; Montana, $119,308,147; Idaho, $57,249,197; Colorado, $30,000,000; and Oregon and Washiugton Territory together, $25,504,250. Besides this Arizona and New Mexico have commenced a yield which will greatly increase with settlement and safe and cheap communication with that country. British Columbia has furnished $9,000,000. This is the resnlt of but a quarter of a century, and the amount steadily increases every year. The effects of snch an accumulation to the wealth of the world cmnot be comprehended. It has reduced the value of gold one-half. That is, it has so increased the valne of everything else that it takes two dollars now to buy what one dollar purchased 25 years ago. It is a complaisant thought in the minds of a great many Esetern people that they have, on tbe whole, done better than those who came West 20 years ngo. They will tell you how tbeir lands and stocks have doubled and quadrupled in value; bnt not many of them realize thnt because in the far West, in deep ravines, in tunnels, drifts and shafts, strong men were wearing out their lives, they unconsciously have been gaining wealth, that every dollar they have accumulsted is indeed a certificate, surely affirming that those who left them, and sought this Coast, in the years gone by, did not come in vain.

No army ever bronght home such conquests of treasnres; no host ever before so ohanged the face of things. It is almost as though nature hsd passed through another of those periods which geologists mark. and brought its corresponding change upon the face of the earth. Because of the miners' work the great city hy the Golden Gate has burst npou the world. Half the magnificence of the cities of the Eastern States; half the luxuries enjoyed by the people of the East are due to the same cause. Our miners' toil has bnilt new palaces in Europe, and made more gorgeons the mosques and harems of Egypt and of Asia. It wss becanse of their labor that when the great rebellion came, the Government's security for the ultimate redemption of her debts was manifest. It was becsnse of them that, when M. Thiers called on the people of France for five milliards, from Field Marshal to stable-boy, from Princess to chambermaid, all were able to unearth their purses of hoarded silver and of gold, and to ponr them into their country's ceffers, while the world, astonished, looked on. While this has been done for the world at large, a wilderness has been subdued, flonrishing states created, and an empire in extent opened to settlement.

This is no fancy picture. Indeed it is bnt a mesger outline of what these brave men have done. Books might he filled with records of what they have snffered and endured. Strange tales could be written of the etrnggles of great hearts, toiling throngh the years, while youth fled, and hopes which it was bnt just and natural to nurture, one hy one sickened and died; and of the thousands who, their natnres nnappreciated, their depth and worth concealed by a rough exterior and brusque address; of those for whom no record is kept, as year by year they grow weary, and folding their rough robes around them pass, uncomplainingly, away. Snrely these men shonld not be forgotten; surely the people of the whole country shonld think of tbem kindly; and the government ought to listen with patient ear to their petitions, especially when we consider it is not often their wont to ask for anything, except a fair field within which to work, snd six feet of barren soil in which to sleep when the long day's work is done.—*Enterprise.*

Clearing Steam Pipes of Condensed Water. —The *Bulletin* of the society of the former pnpils of the Arts and Metiers, Paris, gives an accouut of an apparatus planned to clear tubes of condensed water, nutomatically, without any sensible loss of steam. It consists of a cast-iron hood, three parts filled with water, with a free discharge pipe and a stop-cock which is in communication with the tube to be cleared. The body of the cock, which oscillates around its spigot, is furnished with a syphon tube which ends in a hollow float. This float is in communication with the water by means of a small hole at the lower part, and is furnished slso with a tnbe plsced in the line of its vertical diameter, open at both ends, and which is prolonged almost to the sides. The tnbe-syphon communicates with the aperture of the spigot of the cock by an orifice which is only covered when the float is drowned, which occnrs when it is two-thirds full of water. As soon as the steam arrives in the rear of the condensed water it fills the float, drives ont the water, and lightens it; the float then rises and closes the communication; it then descends, because the water in the basin fills it anew hy the small orifice below. Thus the float is continually oscillating, opening the cock to receive the condensed water, and closing it when the steam appeare.

Saline Water ann Lean Poisoning.—Champouillon shows that all the barracks and all the military hospitals in Paris receive their water throngh leaden pipes, and that from 1845 to 1869, out of 108,000 sick soldiere treated in the hospitals, there was not one single case of lead disease (intoxication satnrnine). The watere furnished to the garrison contain from 15 to 60 milligrammee of saline matter per litre, and on this account are safe.

A New Enterprise.

For some time past there has been a desire, on the part of the Tuolumne County Water company, to extend their works and infuse new life in the company and its management. As a result of this purpose, the present Board of Trustees has deemed it advisable to endeavor to bring water into the section of country around Montezuma higher than the present line of the ditch, which extends to that place, commands. They have purchased the pipe formerly used by the Chinese Camp Pipe Co., which was incorporated to bring water from the Phœnix ditch, across the depression at Wood's creek, into Chinese camp. This pipe—9,000 feet—is 11 inches in diameter and of iron ranging from 12 to 16 in quality. Dr. Pownall, Superintendent of the company, is having a survey made, (under the immediate direction of Trustee McLeod) from the tunnel that goes through Table mountain—at the Blue Gravel Co.'s works—to the high ground at Red Hill and vicinity, some 150 feet higher than the present line of ditch at Montezuma. The distance will be about six miles, and at a point between Chicken ranch and Looney's ranch, where the new ditch will end, about 4,700 feet of pipe will be used to convey the water across the depression at Turner's flat to the top of Red hill, the objective point at present contemplated. This new canal, by means of branch ditches and connecting pipes, can also be made to command other high mining sections in that vicinity.

This new enterprise, by getting the water high enough, will open a large district of gravel diggings known to be good, and which could not be heretofore worked for lack of hydraulic power. It will infuse new life into that whole section of country, and largely increase Tuolumne's harvest of the yellow gold.

As other opportunities offer for opening new sections to mining enterprise, the company will not be found backward in taking advantage of them, for the benefit of all interested in developing the mineral resources of the county.—*Tuolumne Independent.*

THE AMADOR CONSOLIDATED MINE. — The Reese River *Reveille* says: Work on this mine is being vigorously prosecuted under the superintendence of Captain Kidd. On the upper level six men are engaged in extracting chloride ore from the ledge—which at this point is six feet in width—which runs all the way from $50 to $500 in value per ton. The ore streaks in the ledge vary from two inches to one foot in thickness, some of the ore being of a remarkably high grade. We have seen specimens of sulphurets extracted from this level which will work up as high as $2,500 per ton. There are 250 feet of water in the incline, which will be pumped out as soon as the machinery, which it is contemplated to erect, is in working order. The ledge at the bottom is six feet in width, carrying ore of an average grade, and when drained will be systematically worked. The company intend, should the development warrant, to either erect or purchase a mill for the reduction of their ores. The Amador is but one of many localities in this district which have for a long time laid idle, and which only require energy and a little capital to make them productive; and it is to be hoped that the efforts of this company will be successful, that they may act as a stimulus to the reopening of other mines which are placed in similar circumstances.

SCIENTIFIC EDUCATION. — Prof. Williamson, in a paper read before the British Association, proposed the following plan for more general scientific training: Let the most intelligent and studious children from every private school be sent, free of charge, to the most accessible secondary school, for one year; let the best of these be selected and allowed to continue for a second year, and so on. Let the best pupils from these secondary schools be sent to college, and let those who graduate, after a similar system of weeding out, be supplied with an allowance sufficient for their maintainance for one year, on condition of their devoting their undivided energies to research, under the inspection of competent authorities, while allowed such facilities as the college can supply, with the addition of money grants for specific purposes. Let all who do well the first year be allowed similar advantages for a second, and even a third year.

ALTERATION OF WINES IN VATS OF MASONRY.—The lime and other bases in the mortar are found, by A. Poitwin, to saturate the acids of the wine, and injure its quality. Small amounts of lactic ferment were discovered by the microscope in the wine which had been in a vat of masonry. The difficulty was gotten over by thoroughly drying the masonry, giving it a few coats of potassic silicate, washing out the excess of potassa with water, drying, and finally washing with dilute tartaric acid.

BUTTER MADE BY STEAM.—Mr. C. S. Abbott, the owner of the Abbott House, has a dairy ranch on the Salinas river, three miles from the city. He has 1,500 cows, and makes butter altogether. He gets an average of 100 pounds per cow, and produces 150,000 pounds of butter annually. This, we believe, is the largest butter ranch in the State. The churning, and the regulation of temperature in the milk house, is wholly done by steam; and he makes, as we know, a number one article of butter.

General News.

Joeeph Newman, the well-known raiser of silk-worms, ie now feeding a large uumber of worms at hie house on Shotwell street, near Mission. He hae recently petitioned the Board of Supervisors to plant large uumhere of mulberry trees in Golden Gate Park, for the use, nnder certain restrictions, of such as may desire to raise silk-worms iu thie city. He says the trimmings of the leavee of euch trees are wortb to the feeder $20 per ton, and in the tenth year a tree well taken care of will yield during the eeason $5 worth of leaves, hesidee snetaining its growth. Tbus the Park, if planted over the portione of its eurface not reeerved for drives and walke, might be made to yield in teu years, from $100,000 to $150,000.

The Mill Riven Disaster.—The verdict in the Mill River disaster censures the Legislature for inadequate and defective legislation on the subject; the reeervoir and mill owners for pareimonious disregard of life and property; tbe engineere for ambiguous and inefficient specifications; the contractors for manifest delinquencies and want of thoroughness in their work, and the Couuty Commissioners for accepting a dam eo shabhily built, wheu they had the power to order its entire reconstruction.

Alfalfa as a Disinfectant.—We have heen assured tbat the introduction of alfalfa on our low lands is destined to prove the great dieinfectant of the malaria eo much dreaded in our valley. Alfalfa will grow anywhere on Kern Island, and it smothers out all wild vegetation. Our sloughe are to be dried up and the waters thrown into channels which will carry it all off and leave no more green frog-ponds. Old elough-beds are to be seeded in alfalfa. This ie the proeramme, adopted for the future.—*Southern Californian.*

The Cincinnati Industrial Exposition.—We have received a copy of the report of the Board of Commissionere of the fourtb Cinciunati Industrial Exposition of 1873, also the premium list for the exposition of 1874, both of wbich are fiue specimene of workmanship. Tbe Commissioners will pleaee accept our thanks with our best wishes for the success of their approacbing exposition, wbich will be open to the public on Wednesday, September 2d, aud continne until Saturday, October 3d.

Several expeditions have been sent out to explore the Black Hills country, but they have all had more or less trouble with the Sioux Indians, and been compelled to returu witbout having accomplished that ohject. The force that hae juet started out, under General Custar, from Minnesota, will cross the alkali plains of Dakota, and on reaching the Black Hille will make a thorough topographical eurvey of that wonderful region, which is said to abound in precious metals.

Poor Cuba.—Misery and want are extensive. There is the greatest excitement in consequence. Crime has increased to a fearfnl extent. The papers are daily filled with aseaults and robberies. The jail is literally packed with criminals. The Governor has ordered a part of the Ielo of Pinee to be converted into a correctional or penal colony for traitors, vagrants and incorrigibles, and a military colony will be established there.

Serious Railroad Accident.—A train approaching New Haven, on the Lake Shore railroad, ou Monday laet, ran off the track near Stony creek, and fell a distance of some ten feet upon the marsh below, killing one man, and wounding 78 others. None of the wounded were dangeroucly hurt. The accident was caused by the switcb being changed hefore the last car had passed. Starting with this, the whole train was dragged off the track.

A late telegram from Prestcott says tbe Hualapai Indians, who were compelled by nn Indian agent to leave their ancient home in the mountains and move to a reservatiou in the Colorado bottom, are not thriving. They are unable to cultivate the land, their horses are dying, and they are siokly and miserable. They protested earnestly against the transfer, and the military officers, who were familiar with their mode of life, predicted that the change would he disastrous.

The Iowa Railroad Laws.—The roads geuerally are conforming to the new railroad law, hut under protest. They eay it is useless to enter into continued litigation until the question of railroad righte reachee a decision in the Snpreme Court of the United Statee; then there remain but two courses in case the decision is adveree to the railroad interest, namely, to ohey the etatute or qnit the business.

The Montana etage was rohhed, July 3d, at Big Dry creek, 25 milee south of Pleasant valley, hy fonr masked men, armed with ehot-guns. The eouth coach was stopped first and run into tbe hrush and held until the north coach came, when both were overhauled. The rohbers got ahout $60 in money and Wells, Fargo & Co.'s expreee hox.

The Illinois legielature has paesed a law providing that whoever adulterates milk with water, chalk or other eubstance, or sells such milk, sball be confined in the county jail uot exceeding one year, or fined not exceeding $500.

Lieutenant Charles P. Egan, of Califoruia, who waa wounded in the Modoc war, haa heen appointed Captain of tbe Subaistenoe Department.

The tornado seaeon has commeuced in the East, and the destruction of life and property thue far reported is moet appalling. Honsee hy the hundreds have been unroofed, crops deetroyed, trees torn up by the roots, and people killed and maimed by ecores. Truly these visitations are a hundred-fold woree than earthquakes.

Appeal to Patrons.—The Governor of Minneeota, recognizing that the Patrons are ever ready to relieve the sufferfng and oppreseed, has issued an appeal to the Patrons of Minnesota to forward relief to the farmers of the southwesteru countiee of that State, who have loet their crops by the grasshopper plague.

The Carlists in Spain etill refuse to be put down. They eeem to have takeu new courage at the death of Concha, their ancient enemy, and appear now to he increasing in numbers and etrength. The Repuhlicans are trying to hem them in hy surrounding tbeir front and flanks with permanent fortificatione.

The overland railroads are reducing freight rates to San Frnncisco, just before the departure of each steamer from New York, and increasing them again afterward. The steamers are consequently carrying freight at twenty-five dollare per ton.

Thomas Kelp, of New Brunswick, New Jereey, took his three children to the canal, Monday, and pitched them in, jumping in himself afterward. The oldest child, a girl, was drowned, hut the father and the other children were rescued.

The great bridge over the Mississippi river at St. Louis is finished, and wae dedicated on tbe Fourth inst., that being the ohief feature of the day'e celebration. The construction of this bridge ie one of the leading engineering features of the day.

The Harhor Commiesioners have purchased Taylor's Dredger for $34,000. The Commiesioners eay tbey oan have dredging now done for 10 cents a yard, for which they formerly paid 24 cents.

The wheat crop in Illinois ie suffering seriously in the central counties from the ravnges of the chinch bug, aud all the growing crops are said to be unfavorably nffected hy the drouth.

The report of the loss of the cahle steamer "Faraday," by coming into collision with an iceberg, off Nova Scotia, is denied. She has since been eeen quietly at her work, picking up the cable.

Most of the sheep raieers in Oregon have eheared their last sheep. The wool clip is hetter than ever hefore, both as to quality and amount.

The secoud crop of etrawherries in Santa Clara county ie coming on slowly, and it is believed that the yield will be as light as the other was heavy.

A nugget taken, laet week, from the claim of Weher, Hooker & Windere, at Whisky Flat, Butte county, weighed fourteen ouuces, and was valued at $250.

The property in Clifton dietrict, or Deep creek, in Utah, known as the Filberson property, has just heen eold to a St. Louis Co. for the sum of $90,000 cash.

The model for the proposed equestrian statue of General Thomas has been accepted. It will he erected in Washington.

The frame of the new hall for the Danville Grange of the Patrons of Husbandry, 30 hy 60 feet upon the ground, is already up.

Table for Vessels.—Edward P. S. Audrews, Havilah, Cal.

Transplanter.—Timothy Carroll, Anaheim, Cal.

Atmospheric Power Hammer.—Wm. Maneon, S. F., Cal.

Atmospheric Hammer.—Wm. Manson, S. F., Cal.

Re-issue.

Process of Separating Silver from Other Metals.—Conrad Wiegand, Virginia City, Nevada.

———*The patents are not ready for delivery by the Patent Office nntil some 14 days after the dete of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent husinese for Pacific coast inventors transacted with perfect aecurity and in the shortest time possible.

Amendment of the New Code Incorporation Assessment Law of California.

[Furnished Free from the Mining and Scientific Press Office.]

Directors May Levy Aesessments.

The Directors of any corporation formed under the laws of this State, for the purpose of payiug expenses, conducting business, or paying debts, may levy and collect assessments upon the capital stock thereof, in the manner and form and to the extent provided herein.

Limitation.

No one assessment must exceed ten per cent. of the amount of the capital stock named in the articles of incorporation, except in the cases in this sectiou otherwise provided for, as follows:

How Levied.

1. If the whole capital of a corporation has not been paid up, and the corporation is unable to meet its liabilities or to satisfy the claims of its creditors, the assessment may be for the full amount unpaid upon the capital stock; or if a less amount is sufficient, then it may be for such a percentage as will raise that amouut;

2. The Directors of railroad corporations may assess the capital stock in installments of not more than ten per cent. per month, unless in the articles of Incorporation it is otherwise provided;

3. The Directors of fire or marine insurance corporations may assess such a percentage of the capital stock as they deem proper.

Levy of Aesessment.

No assessment must be levied while any portion of a previous one remains unpaid, unless:

Old Asseement Remaining Unpaid.

1. The power of the corporaiion has been exercised in accordance with the provisions of this Article for the purpose of collecting such previous assessment;

2. The collection of the previous assessment has been enjoined; or

3. The assessment falls within the provisions of either the first, second or third subdivision of Section 332.

What Order Shall Contain.

Every order levying an assessment must specify the amount thereof, when, to whom, and where payable; fix a day, subsequent to the full term of publication of the assessment notice, on which the unpaid assessment shall be delinquent, not less than thirty nor more than sixty days from the time of making the order levying the assessment; and a day for the sale of delinquent stock, not less than fifteen nor more than sixty days from the day the stock is declared delinquent.

Notice of Aesessment.

Upon the making of the order, the Secretary shall cause to be published a notice thereof, in the following form:

Form.

(Name of corporation in full. Location of principal place of business). Notice is hereby given, that at a meeting of the Directors, held on the (date), an assessment of (amount) per share was levied upon the capital stock of the corporation, payable (when, to whom, and where). Any stock upon which this assessment shall remain unpaid on the (day fixed) will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on the (day appointed), to pay the delinquent assessment, together with costs of advertising and expenses of sale.

(Signature of Secretary, with location of office.)

Personal Notice and Publication.

The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the corporation is situated; and be published once a week for four successive weeks in some newspaper of general circulation and devoted to the publication of general news, published at the place designated in the articles of incorporation as the principal place of business, and also in some newspaper published in the county in which the works of the corporation are situated, if a paper be published therein. If the works of the corporation are not within a State or Territory of the United States, publication in a paper of the place where they are situated is not necessary. If there be no newspaper published at the place designated as the principal place of business of the corporation, then the publication must be made in some other nowspaper of the county, if there be one, and if there be none, then in a newspeper published in an adjoining county. [*This paragraph contains the amendment of July* 1st, 1874.]

Delinquent Notice.

If any portion of the assessment mentioned in the notice remains unpaid on the day specified therein for declaring the stock delinquent, the Secretary must, unless otherwise ordered by the Board of Directors, cause to be published in the same papers in which the notice hereinbefore provided for shall have been published, a notice substantially in the following form:

Form.

(Name in full. Location of principal place of business). Notice.—There are delinquent upon the following described stock, on account of assessment levied on the (date), (an assessment levied previous thereto, if any), the several amounts set opposite the names of the respective shareholders, as follows: (Names, number of certificate, number of shares, amount). And in accordance with law, (and an order of the Board of Directors, made on the [date), if any such order shall have been made), so many shares of each parcel of such stock as may be necessary will be sold, at the (particular place), on the (date), at (the hour) of such day, to pay delinquent assessments thereon, together with costs of edvertising and expenses of the sale.

(Name of Secretary, with locetion of office.)

Contente of Notice.

The notice must specify every certificate of stock, the number of shares it represents, and the amount due thereon, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued, must be stated.

How Published.

The notice, when published in a daily paper, must be published for ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, it must be published in each issue for two weeks previous to the day of sale. The first publication of all delinquent sales must be at least fifteen days prior to the day of sale.

Jurisdiction Acquired, How.

By the publication of the notice, the corporation acquires jurisdiction to sell and convey a perfect title to all of the stock described in the notice of sale, upon which any portion of the assesement or costs of advertising remains unpaid at the hour appointed for the sale, but must sell no more of such stock than is necessary to pay the assessments due and costs of sale.

Sale to be by Public Auction.

On the day, at the place, and at the time appointed in the notice of sale, the Secretary must, unless otherwise ordered by the Directors, sell or cause to be sold at public auction, to the highest bidder for cash, so many shares of each parcel of the described stock as may be necessary to pay the assessment and charges thereon, according to the terms of sale; if payment is made before the time fixed for sale, the party paying is only required to pay the actual cost of advertising, in addition to the assessment.

Highest Bidder to be the Purchaser.

The person offering at such sale to pay the assessment and costs for the smallest number of shares or fraction of a share is the highest bidder, and the stock purchased must be transferred to him on the stock books of the corporation, on payment of the assessments and costs.

In Default of Bidders, Corporation may Purchase.

If, at the sale of stock, no bidder offers the amount of the assessments and costs and charges due, the same may be bid in and purchased by the corporation, through the Secretary, President, or any Director thereof, at the amount of the assessments, costs and charges due; and the amount of the assessments, costs and charges must be credited as paid in full on the books of the corporation, and entry of the transfer of the stock to the corporation must be made on the books thereof. While the stock remains the property of the corporation it is not assessable, nor must any dividends be declared thereon; but all assesaments and dividends must be apportioned upon the stock held by the stockholders of the corporation.

Dispoeition of Stock Purchaeed by Corporation.

All purchases of its own stock made by any corporation vest the legal title to the same in the corporation; and the stock so purchased is held subject to the control of the stockholders, who may make such disposition of the same as they deem fit, in accordance with the by-laws of the corporation or vote of a majority of all the remaining shares. Whenever any portion of the capital stock of a corporation is held by the corporation by purchase, a majority of the remaining shares is a majority of the stock for all purposes of election or voting on any question at a stockholders' meeting.

Extension of Time of Delinquent Sale.

The dates fixed in any notice of assessment or notice of delinquent sale, published according to the provisions hereof, may be extended from time to time for not more than thirty days, by order of the directors, entered on the records of the corporation; but no order extending the time for the performance of any act specified in any notice is effectual unless notice of such extension or postponement is appended to and published with the notice to which the order relates.

Aeseesments Shall not be Invalidated.

No assessment is invalidated by a failure to make publication of the notices hereinbefore provided for, nor by the non-performance of any act required in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, are void, and publication must be begun anew.

Action for Recovery of Stock, and Limitation Thereof.

No action must be sustained to recover stock sold for delinquent assessments, upon the ground of irregularity in the assessment, irregularity or defect of the notice of sale, or defect or irregularity in the sale, unless the party seeking to maintain such action first pays or tenders to the corporation or the party holding the stock sold, the sum for which the same was sold, together with all subsequent assessments which may have been paid thereon and interest on such sums from the time they were paid; and no such action must be sustained unless the same is commenced by the filing of a complaint and the issuing of a summons thereon within six months after snch sale was mede.

Affidavits of Publication—Affidavits of Sale To be Filed.

The publication of notices required by this Article may be proved by the affidavit of the printer, foreman or principal clerk of the paper in which the same was published; and the affidavit of the Secretary or auctioneer is primary evidence of the time and place of sale, of the quantity and particular description of the stock sold, and to whom and for what price, and of the fact of the purchase money being paid. The affidavits must be filed in the office of the corporation, and copies of the same, certified by the Secretary thereof, are primary evidence of the facts therein stated. Certificates, signed by the Secretary and under the seal of the corporation, are primary evidence of the contents thereof.

Waiver of Sale—Action to Recover Assessment.

On the day specified for declaring the stock delinquent, or at any time subsequent thereto and before the sale of the delinquent stock, the Board of Directors may elect to waive further proceedings under this Chapter for the collection of delinquent assessments, or any part or portion thereof, and may elect to proceed by action to recover the amount of the assessment and the costs and expenses already incurred, or any part or portion thereof.

This law, as amended, took effect July 1st, 1874.

GENERAL MERCHANDISE.

WEDNESDAY M., July 8, 1874.

Bags and Bagging are firm at noted rates. A lot of 75,000 second-hand English Wheat Bags changed hands, it is said, at 9@12½c; sale on private terms. An improvement has been made in Eastern Cod, while Salmon and Mackerel are nowhere. Spices are dull, and prices lower. The Sugar war seems to have ended, for a time at least; and during the cessation of hostilities rates are ½c higher throughout the line. Syrups and Molasses are also firmer.

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & CO.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

H. W. RUCKER, M. D.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* Tn day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

PLAINFIELD, July 4th, 1874.

MESSRS. DEWEY & CO.—*Dear Sirs:* I acknowledge receipt of yours of 2d inst., inclosing my Letters Patent. I thank you for the interest you have taken in obtaining the same. Yours truly, M. W. COON.

And in accordance with law, and an order of the Board of Directors, made on the 18th day of April, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 123 Post street, San Francisco, California, on the 25th day of June, 1874, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. O. C. MILLER, Secretary.

Office—No. 123 Post street, San Francisco, Cal.

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the twenty-third day of July, 1874, at the same hour and place. By order of the Board of Trustees. O. C. MILLER, Secretary.

San Francisco, June 22d, 1874. jn27

Electric Mining Company — Principal place of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 10th day of June, 1874, an assessment of Ten Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, in San Francisco.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the fifth day of August, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

A. B. PAUL, Secretary.

Office—318 California street, San Francisco, California. Room No. 13.

Enterprise Gold and Silver Mining Company.—Principal place of business, San Francisco, California. Location of works, Meadow Lake District, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of June, 1874, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 411½ California street, room 3, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 22d day of July, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 15th day of August, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

E. E. RICE, Secretary.

Office, Room 3, 411½ California street, San Francisco, Cal. jn27

Land Purchasers' Association—Office, No. 425 Kearny street, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Directors, or Trustees, of this corporation, held on the 9th day of June, 1874, an assessment of ten dollars per share (being the 41st monthly installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 425 Kearny street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of July, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 4th day of August, 1874, to pay the delinquent assesment, together with costs of advertising and expenses of sale.

C. S. WRIGHT, Secretary.

Office, No. 425 Kearny street, San Francisco, California. Room No. 2.

Hereafter stockholders allowing their stock to be sold as delinquent, cannot redeem it, except at the option of the Board of Trustees. jn13

Manhattan Marble Company of California—Principal place of business, San Francisco. Location of works, Oakland, Cal.

Notice is hereby given, that at a meeting of the Board of Directore, held on the 16th day of June, 1874, an assessment of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at his office, 212 Sansome street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpnid on the 20th day of July, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 11th day of August, 1874, at noon, to pay the delinquent assesment, together with costs of advertising and expenses of sale. SAMUEL B. POPE, Secretary.

Office—212 Sansome street, San Francisco, Cal.

Ohio Consolidated Gold Mining Company.

Location, West Point, Calaveras County, Cal. Principal place of business, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the Thirtieth day of May, 1874, the several amounts set opposite the names of the respective shareholders as follows:

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an improved LITTLE GIANT.

Metallurgy and Ores.

E. N. RIOTTE. JAS. L. BEYEA. S. O. BROWN

AUBURN MILL COMPANY,

Reno, Nevada,

Purchase Silver Ores in quantities of ten tons and upwards, delivered on board the cars at San Francisco or Oakland at the annexed Net Rates, WITH NO CHARGE FOR SAMPLING OR REDUCTION. On lots of less than 10 tons, freight to Reno will be deducted.

Special Rates for Gold Ores.

On Gold *contained in Silver Ores* to the amount of $30 and upwards, 63 per cent. will be paid. When less than $30, and above $10, the amount will be added to the Silver value. Sacks promptly returned free of charge. Ores sampled by Battery or Sampling Mill as shipper may elect, and returns made promptly by cheque on San Francisco.

Rates:

Assay Value.	Per Cent.	Assay Value.	Per Cent.	Assay Value.	Per Cent.	Assay Value.	Per Cent.	Assay Value.	Per Cent.	Assay Value.	Per Cent.	Assay Value.	Per Cent.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsrates as Follows:

The pan being filled, the motion of the mullar forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excal all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Morris' Settler and Amalgamator.

PATENTED MARCH 25, 1873.

An important improvement in milling. Cheap, light, efficient and durable. Gains Quicksilver on working tailings. Is discharged from the surface in the center instead of the side, by means of a Syphon which extends to near the center of the Settler. Heaviest casting weighs only 135 pounds. The sides and bottom of the Settler are made of wood, as also Mullers, placed vertically—the friction of which brightens the quicksilver.

One of these machines is in daily operation at No. 616 Merchant street, (basement), San Francisco, Parties desiring information as to rights of use, purchase, etc., can address, FREDERICK MORRIS,

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

The best, speediest, and surest metbod for you to obtain patents, file caveats, or transact any other important business witb the Patent Office at Washington, or with foreign countries, is through tbe agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal ageuts on this side of tbe continent. Tbey refer to the thousands of inventors wbo bave patronized them, and to all prominent business men of the Pacific Coast, wbo are more or less familiar with their repntation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend tbe points and secure mnch more fully and quickly tbe patents for our home inventors, but witb tbe influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public wbo are more ready to give a fair trial, and adopt a good thing, upon the recommendation of bonest and intelligent publishers.

To Obtain a Patent.

A well-constructed model is generally first needed, if tbe invention can well be thus illustrated. It must not exceed 12 inches in length or higbt. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address npon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting tbe improvement describiug tbe various parts and tbeir operations.

Also send $15 currency, amount of first fee of tbe Government. Tbe case will be placed on our regular file, tbe drawings executed, and tbe documents made up, aud soon sent to tbe inveutor for signing.

As soon as signed and returned to ns with the fees then due us, it will be sent straightway to tbe Patent Office at Washgton.

For designs no models are necessary. Duplicate drawings are required, and tbe specifications and otber papers sbould be made up with care and accuracy. In some instances for design patents two photograpbs, with the negative, answer well instead of drawings.

For furtber information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mecbanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of tbe separated ingredients, sufficient to make tbe experiment (unless they are of a common and well-known character), and also of tbe manufactured article itself, must be furnished, with full description of tbe entire preparation.

For Processes, frequently no model or drawings are necessary. In sucb case, tbe applicant has only to send us an exact description, and wbat is desirable to claim.

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

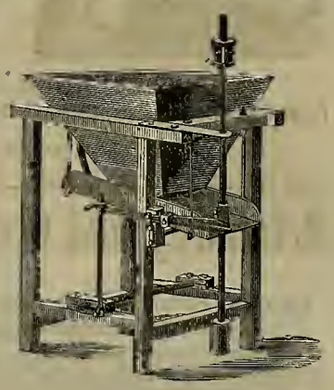
THE ONE-PLUNGER JIG,

Delivered on R. R. Car at Denver, Col., or St. Louie, Mo.,

CONTAINING SIX SIEVES, END TO END,

Separates in one and the same operation—1. galena and sulphide of silver; 2. pyrites or blende; 3. tailings, containing no valnable parts; or, 1. gold; 2. pyrites; 3. tailings (quartz, etc.) containing no valuable parts; or, 1. copper; 2. tailings, containing no valuable parts. The One-Plunger Jig can be combined with existing stamp-mills with highly important advantages, as after amalgamation it will recover completely all fine meta and all hase ores and all mercury out of tsillngs. It concentrates all fine metal ores to such cleanness that low grade ores can he shipped, after concentration, as first-class ores. Its feed and discharge are automatic. Its construction offers better guarantee against loss and repairs than any other apparatus in use. For particulars, apply to the inventor, F. CAZIN,
Mining and Civil Engineer, Denver City, Col.
L. Box 2225. 13v28-1y

Tulloch's Automatic Ore Feeder.



At the request of Mr. Jas. Tulloch, we have carefully examined his patent Ore Feeder for Quartz Mills, now on exhibition in this city at the Pacific Foundry, and in view of its simplicity of construction, directness of action, durability and compactness, as well as its small weight and the low price at which they are held by the patentee, so as to place them within reach of all mill owners, are free to state our unqualified opinion that we regard it superior to any Ore Feeder of which we have any knowledge in actual work. We are confirmed in this opinion by the severe tests to which it has been put, doing its work thoroughly well on ores of all kinds. We find the delivery to the mortara of the ore-stuff, whether dry, damp or wet, to be entirely uniform and regular, and that even alimes and slush can be worked in them under perfect control.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

VOLUME XXIX Number 3.

Aaron's Amalgamation Process.—No. 3.

[Written for the MINING AND SCIENTIFIC PRESS by the Inventor.]

Amalgamation, etc.

Barrels appear to be, as yet, the most convenient for this process, though I have another machine in view, which has not yet been tried. Pans are not admissible, because the iron decomposes the copper dichloride, preventing it from doing its work on the ore, and contaminating the bullion with copper. It is true that iron is used frequently, as already shown, but it is in such a way that its effect is under control, as it cannot be in a pan.

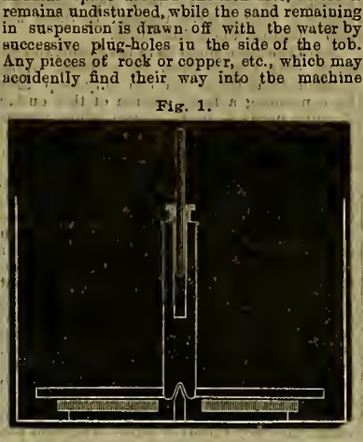
The common Freiburg barrel, with a hole bored in each journal, one to admit steam, the other as an outlet, to prevent danger of bursting, will answer well. It should be lined with wooden blocks, placed so that the grain of the wood is vertical to the axis of the barrel. To make the blocks, a three-inch plank is cut into pieces two inches long, which is best done at the saw-mill. The blocks thus made are then beveled with the jack-plane to suit the circle of the barrel. There is no need of great nicety in this work, and they should be put in as loosely as they can be made to stay, to allow for swelling. A manhole in the head of the barrel is necessary to allow the entrance of the workmen, and when the lining is worn through it is removed, and renewed. The lining may be dispensed with if the copper, in the form of long bars, is fixed lengthwise in the barrel at the distance of about half an inch from the staves. This arrangement answers very well, and saves room and weight, as well as avoiding the wear of copper, which, in working poor ores, is apt to reduce the fineness of the bullion, thus entailing a double loss; but it necessitates the use of enough mercury to wash the amalgam from the copper bars, on which it is inclined to stick, or the barrel must be cooled occasionally so that a man can enter, and the accumulated amalgam beaten off the bars; or again, so little quicksilver must be used as only to moisten, so to speak, the reduced silver, in which case it will not adhere to the copper. Working in this way quicksilver must be used in the settler to gather the floating amalgam. When loose copper is used, small flat bars, or pieces about three inches long out from a round bar, are preferable to balls, as they cause a more even wear of the lining. A lining two inches thick will last, with a little repairing, several months. The best arrangement of the barrels is that seen in all works treating of the Freiburg process, where a V trough extends lengthwise under one or a dozen barrels conducting the discharged pulp, etc., to the separator. The main portion of quicksilver and amalgam must be arrested in the trough or sluice, by a riffle or recess, and not allowed to go into the separator, unless two separators are used one after the other. The reason of this will appear shortly.

The Separator.

The usual style of separator is objectionable for reasons already given. The kind I prefer for this purpose is shown in Fig. 1, and consists simply of a wooden tub six feet in diameter and four feet deep, in the bottom of which is an iron annular disc, raised an inch and a half from the bottom of the tub by a smaller disc of wood under it, which leaves the iron disc projecting about two inches. The muller is made of scantling in the manner shown in Fig. 2, and the arms are short, not reaching to within six inches of the side of the tub.

The mortises are arranged with keys, so that the muller can be clamped tightly to the square wooden shaft, the lower end of which runs on a low wooden cone having a core of mountain mahogany, and rising from the bottom of the tub up through the iron disc to a hight of several inches. The upper end of the wooden shaft is connected with a short iron shaft, working in boxes attached to the framing, and carrying the pulley or gearing. The wooden shaft should be arranged to slide upon the iron portion, so that the muller may drop as it wears away, or may be raised with a lever in case of accident. The shorter the arms are the higher speed is used; and it should be such that the sand and particles of quicksilver are kept in continual suspension, till the latter, gathering together in a mass, settles into the annular space around the iron disc, where it remains undisturbed, while the sand remaining in suspension is drawn off with the water by successive plug-holes in the side of the tub. Any pieces of rock or copper, etc., which may accidently find their way into the machine

Fig. 1.

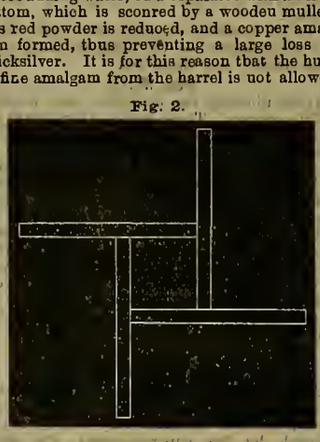


lodge under the projecting edge of the iron disc.

Now as to the loss of quicksilver. In the foudo, as already stated, it is enormous, being, according to Phillips, from one to four pounds for each pound of silver obtained. When I was using a separator made entirely of wood, I lost as much as nine pounds to the ton of ore. This loss was not simply mechanical, for the most careful panning failed to show more than the usual quantity. I was quite puzzled for a time, as there was no indication of the formation of much calomel, nor, indeed, did it seem probable in view of the precautions used. I however observed a reddish powder in the tailings, very heavy and easily separated from sand by washing in a saucer; but no amount of rubbing, nor acids, nor alkalies, would develop visible quicksilver. Nevertheless, on drying a little of the powder on the warm stove, it was resolved mainly into quicksilver, with a residue consisting of a black powder, which, under the blowpipe, gave indications of copper, lead and chlorine. On further examination I found that this red powder (it is sometimes purple) would not yield quicksilver on being stirred in water with a piece of clean copper, but, on adding bluestone and salt (copper proto-chloride), the piece of copper became amalgamated, and quicksilver soon appeared in globules, which readily united. I next found that a piece of iron, in presence of copper dichloride, gave the same result, and the remedy was found.

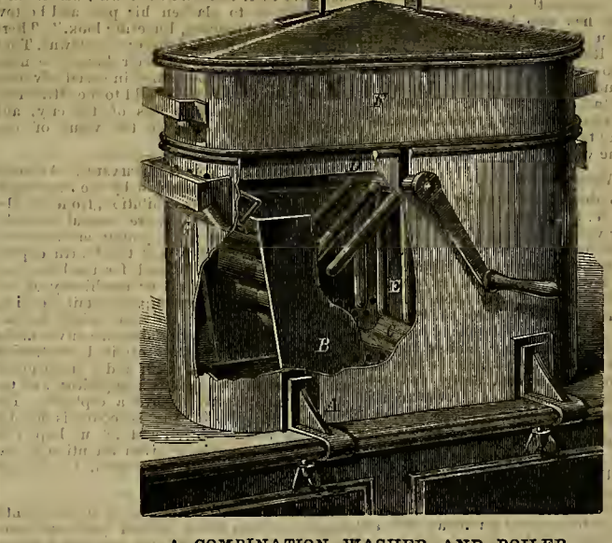
The pulp, as discharged still warm from the barrel, always contains copper dichloride in solution. By working it for an hour or two before adding water, in a separator with an iron bottom, which is scored by a wooden muller, this red powder is reduced, and a copper amalgam formed, thus preventing a large loss of quicksilver. It is for this reason that the bulk of fine amalgam from the barrel is not allowed

Fig. 2.



to enter the separator, where it would become mingled with the base amalgam there produced.

The low amalgam obtained from the separator contains a good deal of silver, chiefly due to a portion of fine amalgam which unavoidably passes with the pulp from the barrel. It may be used in the barrel in place of a portion of iron borings, or retorted, and either sold as low bullion, or melted into balls for the barrel.



A COMBINATION WASHER AND BOILER.

In retorting this kind of amalgam there occurs, to a certain extent, a separation of copper from silver, which is more complete, as the retorting is urged more speedily; so that the spongy mass of metal may be separated into three classes: one nearly fine silver, one nearly pure copper, and a medium.

Conclusion.

This process is not, like roasting, a panacea for all the ills that silver ores are heir to. Its suitability for any particular ore is best determined by digesting a weighed portion of the pulverized sample, dosed with chemicals in accordance with the explanations already given, in a glass or porcelain dish, with a piece of copper and some quicksilver, till it no longer gives a precipitate of silver on a piece of clean copper. The resulting silver, referred to the quantity of ore worked, and compared with the assay value of the ore, will give the percentage extracted.

In testing the pulp with iron, to ascertain if the proper quantity of chemicals has been used, it will sometimes give a black coat instead of the copper color. In this case it will often be found that by letting the barrel run a couple of hours, the proper appearance will be got, but if not, more chemicals are needed.

The bullion obtained will, with good management, be from 900 to 990 fine, no matter what the ore may contain. The quicksilver is always clean and bright, and the loss need not exceed two pounds per ton of ore. The expense of chemicals is light—in most cases, far less than that of roasting, while the percentage of silver extracted is not surpassed, if equalled, by any other process; being, in Benton, from 80 to 97 per cent. of the assay value. It is clearly the best process for certain classes of ores. Whether all the ores of the Comstock vein can be worked by it or not, I am not prepared to say, having only made two tests, which were quite successful; but it is certain that the experiments made some time since by a scientific commission, to determine the action of copper salts on those ores, were not conclusive, as the presence or absence of metallic copper makes a great difference.

Combination Washer and Boiler.

The accompanying illustration represents a washer and boiler combined, which is the invention of Mrs. Mary A. Barnes, of Olympia, Washington Territory.

The boiler proper is akin in shape to that usually employed, and is supplied with clamps, *A*, so that it may be firmly secured to the edge of the top of the stove or range by means of set screws. Inside of the main receptacle is a vessel, *B*, the sides of which are vertical and support a circular corrugated bottom, as shown at *C*. In the lower part are a number of perforations, to allow of the free passage of the water. *D* is a shaft, one end of which is secured in a socket on the main receptacle, and the other passes through a vertical slot made in the edge of the latter, carrying at its extremity a crank. The shaft is provided with radial arms, *E*, which project from its lower part, so as nearly to touch the corrugated bottom of the vessel, *B*. The water and soap being placed in the boiler, the clothes are laid in the inner receptacle, and the crank being rocked, are caused by the arms, *E*, to sweep the corrugations, and are quickly cleansed.

It is necessary to remark that the extension, *F*, does not constitute a part of the washer proper, but is used in rinsing, to prevent the spattering of water; and the spout, *G*, is attached to a cleat to receive a wringer, the water pressed from the clothes being conducted by the spout back into the boiler. It is claimed that this is a labor and time-saving machine, while its operation will not injure the slightest fabric. It is operated by merely vibrating a crank, and the garments may be washed, rinsed and wrung ready for the line almost without wetting the fingers.

It is constructed entirely of metal, so as to be durable, and as there is no shrinkage or warpage which would cause a necessity for repairs. The Combination Washer and Boiler presents several features peculiar to itself, among which is the gripper motion, over a corrugated surface, the nearest approach to the old process by hand. It supplies, in one article, the place of three hitherto indispensable articles in every household—the boiler, the tub and the wash-board. For further information, in regard to price, rights, etc., address Mrs. Mary A. Barnes, Olympia, W. T.

THE Manhattan Mill and Mining Company suffered a severe loss this week. Incendiaries set fire to the wood ricks on the company's principal wood yards, situated 16 and 25 miles from Auburn, respectively. Over 1,800 cords of wood were destroyed, worth from $12 to $15 per cord in Austin. The two piles of wood were fired in several places, and before assistance could be rendered the wood was all consumed.

LIEUTENANT WHEELER'S surveying expedition has left for Pueblo, Colorado, where the party will rendezvous on the 19th inst., and whence they will start for their field of operations.

A COAL vein, seven feet wide, has been struck on the old Bond farm, in Oregon.

CORRESPONDENCE.

The Coal Beds of the Weber River, Summit Co., Utah.

[Special Correspondence to the MINING AND SCIENTIFIC PRESS.]

I msde a very interesting tonr in Snmmit county a short time sincs—visited the celebrated coal beds in ths valley of the Weber river, and examined a number of the minss in the vicinity of Coalville for the express purpose of becoming psrsonally acqusinted with the extsnt, formation, and gsneral characteristics of thsss important mineral deposits. Summit connty has long bsen justly celebrated for its coal bsds, many of them hsing of very remarkable bresdth and thickness, the veins generally averaging 12 feet thick and all solid coel. Abont 20 minss havs besn opened, a numbsr of which ars worked at pressnt with very grsat success, yielding an average of nearly 200 tons of coal per day. As only a comparativsly small portion of thia county is well adapted to agriculture, the principal source of wealth must be derived from its mineral dsposits. At pressnt the most important branch of indnstry is coal mining; bnt the development of other minsral will follow in dne courss of time. Iron is said to have besn discovered in largs quantities in ths eastern part of the conty in close proximity to the coal heds, together with large snpplies of limestone, sandstons, gypsnm and fire clay. There exist also quarriss of huilding and flagging rock, which will he extensivsly sxported; and in ths southsstern part of the county are fins forests of fir, pine and tamarack, which can bs nssd for all mining purposes, and where a considerable lumher trade alreedy exists with towns on the Union Pacific railroad.

Professor McFarland, in his able and exhanetive report upon the coal mines of the Rocky mountains, gives it as bis opinion tbat the coal beds of Colorado, Wyoming and Northern Utah are all of the same formation, and helong to the tertiary period. The coale of this period can scarcely ever be made into a firm coke, and consequently are not in great favor or demand among railroad men. Many emall seams of slate are also found in some of the beds, which not being easily separated from the coal impairs its value to a certain degree; bnt this would be generally overlooked in analysing epecimene of the coal, which could always be seleoted free from the slate. Iron pyrites are also ahundant in some of the beds, and spontaneons combustion of a waste heap has occasionally occurred, which is no doubt attributahle to the decomposition of the pyrites. Mineral resin has also been discovered in the coals, and other foreign substances; hut very rarely in snfficient quantities to he injurious. All the coale of the tertiary period poesess one common quality—they tend to crumble eoon after being exposed to the weather, but will remain for a long time unchanged if properly protected. This tendency to crumble might occasion great waste if proper precautions were not taken, especially as the coals are not capable of being made into a firm coke, which ie quite the reverse of the coals discovered in the sonthern part of the Territory. Railroad engineers complain that the tertiary coal does not burn np clean, that it clinkers and sticke to the bars; etill, it is used very satisfactorily by blacksmiths, who manage to get np a welding heat with it, and for domestic use it ie unrivaled. For thie purpose it is best adapted, and as it can he obtained in any desired quantity, and at a minimum of cost at the mines, it is evident that the businesa is destined to become very extensive, eapecially when there is a reduction in the rates of railroad transportation to Salt Lake city.

Following is an analysis of some specimens of coal from the valley of the Weber:

	Car.	Hy.	Nit.	Oxy.	Total Sulphur.	Water	Mineral Matter.
No 1..	64.824.	4.363.	1.288.	15 518,	1.502.	9.415.	2.999.

No. 3..	64.992.	3.792.	1.736.	15.199	1.066.	11.565.	1.680.

Color of ash No. 1 white, No, 2 gray, No 3 yellow-brown.

The principal mines examined were in the vicinity of Coalville, the connty eeat of Summit county, a flourishing town situated a little above the right bank of the Weber river, abont five miles south from the U. P. R. R. at Echo Station. It is located in the center of a region producing in ahundance different other minerals heeides coal, eome of whioh are the most important beds found in the county. The population is estimated at ahout one thousand, the majority of whom are engaged in the coal mines. As this industry is rapidly increasing, tbe town ie also constantly improving and cannot fail of eventually becoming a place of greal importance.

The first mine I visited was the

Crismon Coal Mine,

Where I was cordially received by Charles Crismon, general manager, who afforded me every facility for examining the property. This mine is situated in a narrow valley or gulch called Spring Hollow, about two and a half miles distant from Coalville. The mine is opened in the hottom of a ravine, entered by an adit level, and again fnrther un by a slope. The dip is to the northwest, and so gentle that a mulo csn haul a ton weight up the iron covered track. The vein being mined at prssent is from 11¼ to 13 feet in thickness, all solid coal, and by careful calcnlation, the amount of coal in sight is computed to be over 200,000 tons. From all appsarances this bed must extend under large areas which have not yet besn explorsd, snd its present dip if continued would carry it under the sandstone cliffs of Echo cañon. The roof is of sandstone, and the coal is very sound in the mine, and also prssents a fine appearance aftsr bsing extrscted; but as befors remarked, if expossd long to the weether, it will not remsin so firm. It is principally adapted for domestic pnrposes, and for tbis use it is in stsady demand in the Salt Lake market.

The mine is developed by a numbsr of inclinss, tunnels, levsls, shafts and coal ohambers, exceeding 2,000 feet face. It was first opensd in 1864, but not worked to any extent until 1867, since whsn it has bssn in constant operation and supplying the adjacent conntry and Salt Lake city. The mine is perfsctly dry, and is kspt in thet condition by a fine steam engine of fiftesn-horse power, wbich is rnn every day for a few hours only. The steam pump is from the manufactory of R. T. Crans & Brothsr, Chicago, and is the first and only pump of this description employed in the coal minss of Utab. It can be recommended as performing most excellsnt work, and shonld bs employed in every mine requiring such a pnmp.

Some valuable improvements have lately been oommenced in the Crismon mine, called the Crismon and Groesbeck

New Works,

Which illustrats the enterpriss and liberality of the owners. Thsse works, which are in process of erection, will comprise stsam hoisting mschinsry with pnmp power, by which the coal wiH bs all extractsd by steam agsncy. This machinery will grsatly fecilitate the lehor of mining, and entirely discontinne ths use of mnle powsr, which has hssn heretofore smployed. These works are being bnilt snbstantially of stone, and whsn completed, which will be in a short time, will increase the yield from its present oepacity of fifty tons of coal to one hundred tons per day. The mine ie a valnable property, and has been worked very successfnlly by its owners.

I next vieited the

John Robinson Mine,

Which is sitnated in the eame gulch and below Crismon's mine, on the left of the cañon going west, where I was also very courteonely received by the euperintendent, Mr. James Sslmon. This mine was opened ahout two years ago, and is developed by levels and rooms to the extent of about 1,000 feet. The company have three mines, two of which are in active operation. The quality of the cosl is the same as in the other minea in the seme locality, and is nged in the surrounding country and shipped to Salt Lske city. The average width of the vein is 10 feet, and the qnantity of coal in sight ie estimatsd at 50,000 tons. There ie a capacity for raising 50 tons daily, and 15 men are at preeent constantly employed. A fine vein of fire clay has also been discovered in this mine. John Rohinson'e lower mine, in charge of L. C. Richardson, the able superintendent, is also actively worked, and is developed by an incline slope of 300 fest following the vein, and a tnnnel of 75 feet. There are two roome of 60 feet, and the present capacity of the mine is 10 tons of coal per day.

The next mine visited was the

Wahsatch No. 2,

Where I was condncted throngh by the snperintendent, Mr. W. E. Chappell. Thie property is developed hy various levels and roome, and hae a face of 180 feet. The width of vein averagse ahont the same as contiguons mines, and the capacity of the mine is 50 tons of coal per day. About 500 feet down the cañon another level hae been rnn, which ie alsq snccessfnlly worked. This ie a very valuable property. Further down, bnt in another hollow to the right, is the old Allen mine, which is now in active operation, shipping coal daily, and one or two other mines whioh time prevented me from examining personally.

The Summit County Railroad

Rune directly to these mines, and connecte with the U. P. R. R. at Echo, where the coal ie re-shipped without change of cars over the Utah Central to Salt Lake citv. It is a very great loss to the general publio as well as to the mine owners that the ratee of freight on the coal from the mines to Salt Lake city are so exorbitant. With the facilities, preeent and projected, for extracting the coal, if rates of freight were at all reasonable, it could he retailed in Salt Lake city at not more than $5.00 per single ton, and in large quantities at a considerably lower price. In view of thie fact, a number of prominent citizens of Salt Lake city have lately organized a company for the purpose of extending the Summit conuty R. R. from Echo city to Salt Lake via Parley'e park and Parley's cañon, which route is very practicable for a narrow-gange road. Thie enterprise is one of the most important ever inaugurated in Utah, and cannot fail to prove profitable to the company and exceedingly advantageons to the people of the Territory. By the constrnotion of this road the distance to Salt Lake city would be lessened nearly 40 milee, and a plenty of good coal at moderate prices would be ensured to the inhabitants, besides tending to develop a region of conntry rich in many other minerals. An extension of this road running south of the Great Salt lake would also communicate with some of the principal mining districts, which in the conrse of a comparatively very short space of time would he joinsd by numerous narrow-gange lines from different points. It is to be hoped thet this enterprise will soon be completed, as msrchants, mine owners and the gensral pnblic are each and all equally interested, and will bs eqnally bsnefitsd thereby.

B. A. M. F.

Sslt Lske city, Utah, Jnly 5, 1874.

The Lawns of San Francisco.

People generally are ready to acknowledge that the soil of California osn prodnce as fine a orop of grass here as csn be grown on any portion of American soil; bnt the greatest admirers of this country will hardly claim that the meadows here are so lasting, or that we can show as good a sod as in some of the middle States. This being admitted by Californians, and San Frenciscans, espscially, bsing aware that this locality is particularly unfavorable to grass, they have set thsmsslves at work to ovsrcome these natnral disadventages, ths result being snch as may often hs found under similar circnmstances. For it often happens that the labor and persevsrance which the presence of difficnltiss calls forth securss a dsgres of snccess never reachsd by those who know nothing about difficnlties.

San Francisco would have her lawns, bnt ahe could only ohtain them by a liberal outlay of monsy and lahor, and can only kśep them by continuing a large portion of this ontlay. It only needs a hasty glance while passing along our streets to see that the lawns of San Francisco are snoh as can not be exoslled; bnt it needs a more extended observation to form a jnst estimate of the means by which they ars brought up and kept un to their present condition. In the first place, they have a liheral sesding on soil that is in the best possibls condition to receive it; and aa soon as there is sufficient growth to distingnish the weeds from the grass, the former are carefully plucked ont. The grass is allowed to attain a pretty etrong growth before the first cntting, bnt is afterward cut more freqnently; this frequent cutting stimulating a root growth, which finally produces a compact sod. When this is secured the lawn mowèr is rnn over them every week—in many cases, oftener; and they are thus worked down to a clean, soft, velvety surface. Meanwhile, the daily supply of ample irrigation promotes a vigorous growth of grass, and gives to it that rich, deep green, which is so refreshing to the heholder.

The reader will perhaps say, "Why, anybody could prodnce a fine lawn in that way." Very true; and it is jnst what anybody who owns a plot of gronnd near their residences ought to do. The ownere of fine residencss in San Francisco have snrrounded them with lawns which cannot be eurpaseed; and there are also many of the smaller dwellinge and cottages that have their tasteful little lawns, which csnse the passer-by to slacken his pace and hestow upon them a "longing, lingering look." There should he mauy more of these pretty lawns. They wonld attach people to their homes—a most important point to be gained in social advancement—they would greatly add to the attractione and eveu the healthfulness of the city, and would materially enhance the value of real eetste.

PREMIUMS FOR YOUNG MECHANICS.—Amongst the preminme to be awarded by the State Agricultnral Sooiety, at its exhibition, from the 21st to the 26th of September, are several specially offered to encourage the young mechanics of this State. In olase nine of the fonrth department a gold medal is offered for the best original design of an engine, or machinery of any kind, accompsnied by complete detail, working, drawings, from which the same might be constrncted. For the second design a silver medal is offered. For the best original mechanical drawing of any kind, $10; and a eilver medal will reward the sucoessfnl competitor, and the second in rank will receive a diploma. The money thus spent hy the Directors is devoted to a most worthy object, and let us hope that young men who have given attention to mechanics, will not fail to respond to the call made npon them.

DENTISTRY.—The triumphe of modern dental snrgery we may point to with pride and satisfaction. In no country has so great a degree of perfection heen reached in the dental art ae in this. American dentists in Europe are patronieed by nearly all the orowned heads, and fortnnes have been made by onr dentists practicing in the Enropean capitals. Thirty or forty yeare ago, quite one-half the people we met in our business and eocial connections were writhing in the agony of "toothache." Children were expected to pase throngh a period of a dozen or twenty ysare tormented almost continuonaly with dental pains, from which there was no relief save by cruelly uprooting the teeth from their bony eockets. Now, instances of toothache are rare among thoee who take proper care of their teeth, and who promptly call to their aid the dentist when the first aighs of decay are noticed.—*Jour. of Ap. Science.*

N. DOWELL discovered a honlder at Virginia city, lately, containing gold valned at $500 or $600. The gronnd in the neighborhood is completely covered with quartz and qnartz bonldere, which, no donbt, would pay liberally, if properly worked.

Fresno County Mines.

Soms years ago a vsin of qnartz, known as the Champion lead, was discovered nsar the ranch of R. M. Keyes, on the head of Big Dry cresk, and was located by bim and his brother. The ledge showed woll in free gold, and also contsined silver, lead and oopper. After working it for a time, they sold it to other partiss, who worked it for a time and then abandonsd it. Some two years ago, Messrs. Cartwright, Barnss and othsrs located an sxtension to ths original claim. They have worked on their claim from time to time with very sstisfactory results. They have sunk a sbaft some 40 fest deep on the lode, and at the bottom of the shsft ths ledge is ovsr four feet in depth, snd the rock seems much richer than at the surfsce, and has changed in appearance from hard quartz to that of a decomposed natnre. Unlike most veins that have bsen discovsred in this county, ths gold seems gsnerally diffnsed throughout the quartz, and not in pockets, a sign which miners claim is an indication of a good mine. Mr. Cartwright has worked soms of the ore during the past winter and spring, which yielded on an average $14 per ton. Ors of this olass with a good mill, if it could be obtained in qnantities snfficient, would pay largsly for working. It is the intention of the owners to sink the shaft to a depth of at lsast 100 fest this summer and fall, and if the prospects continue good they will endeavor to erect a mill. The original location on ths vein has bssn relocated by Mr. Jenssn and R. M. Keyes, but we have not learned whsthsr they intend doing any work of importance this season or not. It ssems to us that it wonld pay to thoroughly prospect some of the msny quartz veins that sxtend throngh ths foot-hills and monntains of the oounty. In all of them gold and silver abonnds, yet in noue of them has it bsen found in sufficisnt quantitiss to pay at the surface, or at the lowest depth whioh they have been prospected—about 100 fset. Some of the bsst paying ledges in the State did not carry gold in paying qnantities at the depths we havs mentioned. It may be that a world of wealth exists in gold-bearing qnartz veins of Fresno county.—*Expositor.*

El Dorado's Prospects Brightening.

It does not require the vision of a prophet to discern the faot that the tide of prosperity hae set in in good earneet in old El Dorado, and that the time is not very remote in the future, when the lethargy of the past will give place to activity, enterprise and thrift. It is impossible to keep a section of country, combining the natural elemente of wealth whioh we possess, in the hackgrounnd for any great length of time, thongh circumstanoes have seemed to combine to prevent a fresh etart for a long time. It ia only necessary to reflect upon the auperiority of our land and climate for produoing frnit; the great advantages for etock raising; our immense forests of pine, better than which cannot be fonnd in the State; our exhauetless mineral resonrces; the immense amonnt of land suitable for diversified farming; facilities for water power for mannfaotnring pnrposes, etc., to eee that the day is not far distant when all will be profitably utilized. The new ditch now being constrncted will greatly haeten the prosperity of thia portion of the conuty by furniehing a greatly increaeed amonnt of water at much lese than present rates, thns etimulating mining, horticulture, agricnlture and other indnetriee. This ditch is being constructed of sufficient size to float lumber, and it will be but a short time before this will become one of onr leading industries. This will lead to other and diversified manufactnres. The railroad will be compelled to extend its line here to accommodate the bnsiness. Placsrville will grow, not rapidly, but permanently in wealth and importance until she will become the gem of the mountains. Let old fogiee mark these predictions, and see how far wrong we are ten years hence. —*Republican.*

HEAT OF COMBUSTION OF EXPLOEIVES.—It hae been found by MM. Roux and Sarran, in testing the heat dieengaged hy the combnetion of variona kinds of gunpowder, that fine eporting powder prodnced 807.3 heat unite to a given measnred weight; cannon powder, 752.9; musket powder, 730.8; common blasting, 572.2. Thns it will be seen that the better the powder the higher tbe heat caused hy its combustion; while, on the other hand, the weight of the reeulting gaee forms a series of relative figuree running in tbe oppoeite direction, heing .337 to .499 for the fine and blaating powder, respectively.

THE LONGEST ROPE IN THE WORLD.—We have jnst had an opportunity of seeing, at Shadwell (England), a grapnel rope of 10,000 fathome length, without a eplice—that is, a little over 11 milee and a qnarter—made for Siemene' Telegraph Company. The coil formed by thia monstrone object ie five feet high, and its diameter is 24 feet. The rope is three-strand, six and a half inches in circnmference, or two inchee thick.—*Iron.*

THE Virginia coal company, in El Dorada cañon have their machinery np and in running order, and have all the water out of the shaft, which ie 80 feet deep. They are now engaged in opening the old drifts, and have a qnantity of coal of a medinm qnality in sight.

THE pottery of the Bergmann Brothers, at Sacramento, manufactures etone ware and Rockingham ware snfficient to supply the State, and of quality superior to any imported.

SCIENTIFIC PROGRESS.

Aerolites.

In modern times it has been conjectured that aerolites came from the sun, and also from the moon. Many have supposed them to be of terrestrial origin, the material being taken up in the form of dust by whirlwinds, and condensed into a solid by some unknown chemical or physical process. This view is disproved by all reliable investigations which have ever been made. About a hundred years ago, the eminent mathematicians of the time took up the subject, and by a course of elaborate calculations proved, that meteoric stones could not come from the moon, as by careful measurements of their velocity they were found to move, when near the earth, at the rate of 114,000 feet, or about 21¾ miles, per second; whereas, if they came from the moon, they would start with an initial velocity of 8,292 feet per second, and reach the earth with a velocity of only 35,000 feet per second. It was clear, therefore, that they came from a more distant region in space than that occupied by the moon. Biot, Laplace and Poisson, three of the most eminent mathematicians that have ever lived, engaged independently in these investigations, and after 12 years of labor reached results very nearly alike. These investigations alone are quite sufficient to prove the celestial origin of meteoric stones.

The metal iron enters largely into the composition of aerolites. In some specimens it has been proved to be present to the extent of 92 per cent. Seven other metals—copper, chromium, nickel, cobalt, molybdenum, mangsnese and tin—have been found, and the earthy substances, augite and hornblende; also carbon, sulphur and alumina. Altogether, out of the 63 elements recognized by chemists, 20 have been found in meteoric masses. It is to be observed that no *new* elements have been detected, a fact which is significant and interesting. Regarding aerolites as of celestial origin, the only difference we have to note between them and terrestrial substances is in the respective methods in which the component parts are admixed. The minerals are the same as those which are distributed throughout the rocks of this earth, but we have none in which they are held in similar proportions. Aerolites differ widely in chemical constitution, but in one characteristic there is remarkable uniformity. They are all of them covered with a black fused crust, or rind, which extends into the substance no more than a few tenths of an inch. This peculiar physical condition is due to the circumstance that when they strike the oxygen of our atmosphere, in their descent, they instantly ignite, but they do not remain long enough in contact with the air to become fused deep into the mass. If they traversed 300 or 500 miles of atmosphere, the small portions of the largest masses that might reach the earth would be but scoria or cinders. It is probable that millions of small stones, those weighing but a fraction of an ounce, are burned in the atmosphere every year, and nothing but an impalpable dust remains, which is scattered by the winds.

It is certain that meteoric stones are not of terrestrial origin, and that they do not come from the sun, moon, or visible planets. Modern science has quite satisfactorily proved that these bodies are little planets, so to speak, traveling around the sun in orbits of greater or less eccentricity; and that our earth in plunging through space encounters them, and they become entangled in our atmosphere and are rapidly drawn to the earth's surface. The larger masses, though probably very numerous, are yet relatively few in number, compared with the minute meteorites which flash out upon the darkness of night, as fire-balls or shooting-stars. If but six or seven falling stars are seen in an hour, it must be that the earth is passing through clusters of meteors, containing more than one hundred thousand in a region of space equal to her own volume. It cannot be otherwise than that the interplanetary spaces are thronged with these fragments, and it is probable that the stellar regions are likewise filled with them. They constitute the material of which worlds are made, and it is possible that the sun's heat is due to the incessant rain of these projectiles upon his incandescent mass.—*Boston Journal of Chemistry.*

RAPIDITY OF ELECTRIC TRANSIT. — In regard to the rapidity of transmission of electricity through conductors, the experience of telegraphing at great distances has disclosed singular facts. So through land lines on high poles the velocity is at the rate of 14,000 miles per second, but is less when the poles are lower, by reason of the reaction of the induced currents through the earth, while subterraneous or submarine cables transmit the electric wave with only half that velocity. If an electric wave is sent over a conductor consisting first of a land line and then a sea cable, it will travel quicker than if it is sent in the other direction, passing first through the sea cable and then through the land line. It is also found to be a fact that everywhere that the wires run east and west there is a diminution of speed when the sun crosses the meridian.

THE use of Epsom salts is found to give brighter tints to certain aniline colors, especially primula and methyl violet. Sulphurous acid is also beneficial for these colors, the tints being brighter and less readily rubbed off.

ANOTHER CALCULATING MACHINE.—A useful contrivance is the "computing telegraph" introduced by J. E. Fuller, of Boston, who first produced it some 30 years ago, and who since that time has been continually improving it, so that at the present moment it is a most complete instrument. It consists of a square board made of old tarred rope, a material which is not given to expansion or warping; upon this is posted an engraved card, which has a graduated circle of the diameter of 8½ in. Within this circle there is an inner circle, which revolves, and is graduated in the same manner as the outer circle. The divisions are from 0 to 10, completing the circle, and are the same for both; the divisions are similar to those of the ordinary slide rule, and decrease in a perfectly regular logarithmic order. In fact, the instrument is a circular slide rule. It possesses a great advantage over the ordinary straight slide rule, in consequence of its length (the actual length of the rule being 26.7 in.); this advantage is further increased from the circular arrangement being endless, only one scale of 0 to 10 is required, whilst in the ordinary rule, one wants 0 to 10 and 10 to 100. The instrument forms a slide rule of a very perfect character, and enables one to work out the simplest and most complicated arithmetical questions. In calculations where the same factor has to be used many times, the saving of time is enormous. For engineers of whatever kind, such a calculating machine must prove useful.

THERMO-ELECTRICITY IN IRON SHIPS.—There is a curious point, says *Broad Arrow*, in connection with the deviation of the compass on board iron ships, which is now beginning to attract the attention of scientific men, and may therefore perhaps be new to some of our readers. It is now believed that some of the sudden and hitherto unaccountable changes in the deviation of the compasses of iron ships—which are often unsuspected until alleged as the only conceivable cause of the vessel running ashore—are the effects of an unequal and varying distribution of heat over the iron hull; for it is well known that electricity is generated in a metallic substance by heat applied in a certain way, and, in fact, there is a branch of electrical science called thermo-electricity, devoted to the investigation of phenomena of this kind. Sudden slight changes of compass deviation, not exceeding five degrees, have been noticed on board iron ships on the North American coast, and these are now attributed to changes in the temperature of the hull, occasioned by the vessel passing from warm to cold water, and *vice versa*. The warm temperature of the Gulf stream, taken in connection with the cold counter-current, is considered to be quite sufficient to account for many of the suspected compass errors on board iron ships.

A SCIENTIFIC SELL.—The following item is going round the western papers in regard to a supposed aerolite discovered on an extensive farm in Tippecanoe county, Ind. It says: "The aerolites heretofore found are of a solid and metallic nature, having evidently struck the earth as compact bodies. This one is different. The fragments are honey-combed, like a cinder, and vary greatly in their weight. The outside presents the appearance of a soft body that has struck upon solid particles, as the indentation of grass blades, straw and sticks are plainly discernible. One of the fragments had fallen on a large stick of wood, and conforms to it exactly. The very texture of the wood can be seen. They can be accounted for upon no other hypothesis than that the rapid revolution of the liquid mass in its descent threw off these particles by centrifugal force. A box of these fragments will be shipped to the Smithsonian Institute, and the remainder are intended for the Purdue Agricultural College." We are satisfied that when the specimens arrive at the Smithsonian Institute, they will be recognized for what they are—cinders from a burned up haystack.—*Manufacturer and Builder.*

ELECTRIC LIGHT.—A light produced by frictional electricity was recently exhibited in England which was stated to have been equal in intensity to that from 7,000 candles, and we are informed that a light equivalent to 10,000 or 14,000 candles has been produced. But the great value of the light is that it is constant. The current is absolutely unintermittent. What the light is at the end of the first five minutes it is at the end of the hour, or so long as the carbon points remain unconsumed, and the process of the production of the current is so simple that it is marvelous that it has not been before discovered. Two or two and a half horse-power are ample to produce the rotation of three bobbins or broad-edged discs covered with copper wire, and acting upon six pairs of soft iron parallel bars, similarly covered. Magnets are entirely dispensed with in the production of the power, which is derived altogether from friction, there being no battery brought into the circuit in any shape or form.

PAINTS.—An improved vehicle for paints, to be used in house, ship and general work, has been patented, which is composed of 100 parts by weight of hot water, four parts of potash and six parts of carbonate of soda. This mixture when dissolved is boiled, and, two parts colophony and 10 parts oleic acid are then added separately, after which the whole is boiled until completely dissolved.

NATIVE SILVER AMALGAMS.—Some researches, by M. Pisani, on the amalgams of silver occurring at Konigsberg, in Norway, show that two distinct amalgams are found.

MECHANICAL PROGRESS.

Making Match Sticks.

[Concluded.]

The quantity seems enormous, and almost staggerers belief, but such is the velocity with which the machines are driven, and the multiplication of the sticks so rapid, that there is no difficulty in producing the number stated. When the wheels are in motion, the sticks fall from the cutters in a regular shower, and are caught in a trough below, through which passes a belt or elevator, which carries them to a series of machines, called shakers, with small latticed bottoms, in which they are subjected to a violent shaking as they pass through. This operation is for the purpose of removing all imperfect sticks and pieces of shavings. As they pass through, they are deposited in large cases ready to be carried to the drying rooms. These rooms are three in number, each fourteen by fourteen feet, the floors of which are covered with a series of steam-pipes. The boxes containing the sticks have latticed bottoms, and are placed upon these pipes in tiers, one above the other, four or five deep, when the heat is forced through the entire mass. Here they are allowed to remain for a day and a night, subjected to a temperature of 120 degrees, which effectually dries the wood, rendering it almost as light as a feather. As great care must be used to guard against fire in these rooms, perforated pipes, with an independent connection, are liberally provided, through which a sufficiency of steam can be forced in a moment to extinguish fire in case of combustion. After going through the drying process, the sticks are carried to another series of shakers. Here, by an ingenious arrangement, the sticks, as they are shaken up by a lively motion, are straightened, when they are deposited in metal boxes at the lower end of each machine, with circular bottoms. These boxes are made to hold as many sticks as can be grasped by the hand, from whence they are taken, and packed in cases ready for shipment to the finishers, who apply the compound to the tips. After tipping, the matches are placed in boxes for sale. The plain match-stick may be looked upon as an insignificant item at first sight, but a moment's reflection will convince the reader that an enormous quantity is required to supply the daily consumption. The making of these match-sticks is a distinct manufacture, the match-makers in large cities purchasing the sticks for tipping. The American Match-Stick Company, at Williamsport, Pa., employ the process described above, and when fairly under way, expect to make and ship a full carload of match-sticks per day to their various customers. It is estimated that in Europe and the United States, the amount of wood annually consumed in the manufacture of match-sticks is, at the lowest calculation, four hundred thousand cubic yards. One of De Bowens' machines, requiring three horse-power to drive it, will, it is claimed, cut in ten hours fifty-two millions of match-sticks. This machine is also claimed to consume less lumber by one half than that consumed for the same number of sticks by any other machine yet invented.—*Journal of Applied Science.*

Inventions Anticipated.

A most singular sketch of certain inventions has come to light in an article published in an English magazine of more than a century ago. The writer heads his claims with "The Art of War, discovered by me, John Cross, for the benefit of that king who will give me employment." The particulars promised by Mr. me, John Cross, are as follows: 1. To fix gunpowder in the water, if a ship or vessel should touch the same, it will instantly be blown up. 2. To convey a cannon along the bottom of the sea, and fire the same at the distance of one mile and half from the land, under a ship's bottom. 3. To convey a floating battery, the same distance from the land, alongside of a ship, and fire balls into her under the surface of the water. 4. To convey fixtures the same distance, along the bottom of the sea, which will catch ships' moorings and drag them on shore. These inventions are to be made use of, when an enemy's shipping comes to cannonade or bombard a town. 5. To fix gunpowder and bombshells under the earth, so that when an enemy treads upon the same it will instantly blow up. 6. To fix the same materials under the earth, so that when an enemy comes thereon, I will stand two miles from them, and blow them up without using either match or train. 7. To fix the same materials under a gate, and by opening the same, a whole army may be destroyed. 8. To fix the same materials under the earth, and when enemies lift up any thing that I may lay thereon, will be blown up. These inventions may be made use of when an enemy is on the march. 9. I have also brought to perfection a moving battery, which is to be drawn by horses, and it may reasonably be expected 50 men can withstand 1,000 men, firing cannons, small arms, hand grenades, etc. This invention is extremely useful against an enemy when landing or in the field of battle. 10. I will fix a cannon upon a level with the earth, against the walls of a town or shipping that the greatest force of an enemy cannot dismount it or hurt any of the people belonging to it, and is as handy to be worked as a swivel. For this cannon I will take upon me to account for it to be the most masterly and warlike invention yet discovered.

Finishing Bronzes.

When the casting is completed, the bronze must be cleansed, which is generally accomplished by washing it with a very dilute solution of oil of vitriol. The casting is then repaired, the core marks taken off, and the bronze rifled over. Some founders sand-paper their bronzes to produce a smooth appearance, but it is claimed that in artistic work this should never be done.

That peculiar kind of bronze work called galvano-plastique is produced by depositing a heavy coating of bronze by the galvanic process upon a plaster of Paris model, and afterward removing the model.

The greenish or olive hue which bronzes acquire by age and exposure, known as verd antique, is very much prized by *connoisseurs*, and there are various washes used to develop the color at once. The different shades of verd antique depend upon the nature of the wash used. The following recipe can be used with very good results: Two drachms of sol-ammoniac, and one-half a drachm of binoxalate of potash are dissolved in 14 ounces of colorless vinegar. The solution is applied with a hair pencil in a very thin layer, the object having been previously warmed gently, and the operation is repeated until the desired color is produced.

There are various other treatments applied to bronze, in order to obtain the many shades of color necessary to suit the varied tastes of the community. Coloring is also applied to give a uniformity of appearance to the bronze, which, when it first comes from the mold, often presents an irregular appearance as regards shade and color. Another object to be attained by this treatment is to vary the light and shade in the different parts of the surface. Thus, where a fold in drapery is represented, it is necessary to give quite a dark appearance to those parts which would be naturally shaded. —*Iron Age.*

MACHINERY WITHOUT LUBRICATION.—Our attention has been called to a recent invention, the object of which is to entirely dispense with the use of lubricants in all classes of machines, and which is now on its trial with a good prospect of success. The value of such an invention cannot be over-estimated when the resulting cleanliness, saving of the cost of lubricants, and of time and attention in oiling bearings are considered. For the ordinary metal bearings are substituted others of a peculiar composition, less than half the cost of metal, but which can be turned, bored, and is otherwise susceptible of treatment similar to metal. Should this invention realize the expectations reasonably formed from its application thus far, the liability to accidents will be greatly lessened; for it is well known that these frequently occur in oiling bearings. Another source of consolation will be that these new bearings are not likely to find purchasers at the old metal shops, to which their more attractive looking rivals now frequently gravitate. The thanks of those that "go down to the sea in (steam) ships" will also be gratefully rendered to the inventor, for who has not felt nausea from those most gross and fetty smells from the engine room. As to the comparative durability of these bearings with the metal ones, it should be stated that the first bearings at Vienna, now nearly nine months in use, do not exhibit any signs of wear or deterioration.—*Colliery Guardian.*

AN OYSTER PATENT.—One of the great troubles which oystermen have to contend with is the starfish. This rapacious enemy destroys thousands of bushels of oysters every year, and no device has heretofore proved effective as a protection. But the ingenuity of a Connecticut Yankee has at last triumphed. Mr. Oliver Cook, of Darien, Conn., has lately obtained a patent on the subject. His invention consists in spreading a net, under water, on the ground composing the oyster bed. Mr. Starfish puckers his fingers together, squeezes himself up through the meshes of the net, and then extends his digits again. Being now upon the upper side of the net, he will be infallibly captured whenever the oysterman raises the net to the surface. This is to be frequently done until the enemy is cleared from the coast, when the oysters at once begin to laugh and grow fat.—*Scientific American.*

ICE MANUFACTURE.—A Scotch inventor claims improvements in apparatus for the manufacture of ice. In these hollow partitions are made of cast iron; the passages are oblong in cross-section, and bars of wood are placed along their middles to reduce the actual passages for the freezing fluid to very narrow spaces along the sides. The hollow partitions which hold the brine are fixed with their bottom edges some distance above the bottom of the tank, and bars of wood are placed along the bottom edges to prevent the formation of ice round those edges. Steel, malleable iron, brass or zinc may be used instead of cast iron for forming the partitions. Brushes or flexible wipers are made to reciprocate over the surfaces of the ice whilst it is forming, to remove air bubbles.

COMBINED SAIL AND DRAG FOR BOATS.—This invention consists in a novel construction of drag or drag-sheet, which not only has an improved hold upon the water to keep the boat's or other vessel's head to the sea, or act as a floating anchor to a life raft, as the case may be, but which is readily convertible into a sail when its use as a drag is unnecessary, and may otherwise be used to advantage in saving life and property.

Mining Stocks.

Another bad week for stocke hae just closed, everything having gone down pretty low. Nobody knowe any reaeon for it, since reports generally are pretty favorable from the mines. On the Comstock affaire are going on very smoothly and with encouraging proepects. The *Enterprise* of last week says: Here, at home, there ie no exčitement in regard to any stock on the list, and our people appear to be quietly awaiting the conrse of events in the San Francieco Stook Market, feeling that they can endnre a dnll market as long ae any dsalers in stocks on the Pacific coast. Meantime our leading mines are looking unnsnally well, and prospecting and all other mining operatione are being prosecuted with untiring energy. The developments made in the lower levels of all of our leading mines are very enconraging to the owners of neighboring claims, and all are going down with their shafts and inolines ae rapidly as possible. Many of our outside minee are meeting with very favorable indicatione in the shape of feeders and hnnchse of ore, or bodies of water which show a near approach to large bodies of qnartz, if not of ore. In several instances the reservoirs of water tapped have bsen so large as to greatly interfere with the progrese of mining operations, and in a few casee it hae been found neceesary to at once make preparations for the ereotion of new and more powerful machinery. But finally all dificultiee will be overcome, and at length no nook of any of our minee will remain unexplored. In all directions the utmost activity prevaile among ench companies as are engaged in prospecting. Theee occaeionally meet with accidents and detentione of variove kinds, but on the whole the majority of them manage to keep pretty conetantly at work.

Fluctuatione in prominent stocks have been as follows during the week: Belcher varied hetween $72 and $85; Best & Belcher, $22 and $24.50; Caledonia, $17.50 and $18.50; Chollar, $60 and $68; Confidence, $10.50 and $12; Cons. Virginia, $78.50 and $82; Crown Point, $73.50 and $82; Exchequer, $59 and $65; Gould & Cnrry, $18.50 and $21; Hale & Norcross, $45.50 and $51.50; Kentuck, $13.75 and $15; Ophir, $16.75 and $18; Overman, $30 and $33; Savage, $75 and $88; Sierra Nevada, $20.50 and $24.50; Yellow Jacket, $76 and $88.50; Eureka Cons., $14.50 and $17.50; Raymond & Ely, $14.50 and $19.50; Golden Chariot, $8 and $10.50; South Chariot, $11.25 and $12.25.

Declinee from highest prices of last week were ae follows: Best & Belcher, $1.50; Caledonia, $1.25; Chollar, $4; Gonld & Cnrry, $2; Hale & Norcrose, $2.50; Overman, $3; Savage, $2; Seg. Belcher, $6.50; Yellow Jacket, $2.50.

The mills along Carson river will this year have what wood they require floated down to them. At the Eureka mill abont 2,000 corde will be taken out, and other mills will take out what they need as the drive passee down the stream. This will he mnch cheaper than hiring the wood hauled either by rail or by teams.

The Manzanita mine, Nevada county, yielded $30,000 at a olean-up last week.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

California Reduction Works.—July 9. Object: The purchase and sale of real estate, huying mines, mining claims and property of every description, etc.; the manufacture of paints, drugs and dyes of every description; to give and take promissory notes for the procurement of money. Directors: H. H. Eames, H. P. Minear, George R. Dodge, William Willis and C. E. Scott. Capital stock, $600,000.

Agricultural and Mechanical Fair Ground and Race Track Association.—July 10. Object: To construct and maintain Agricultural and Mechanical Fair Grounds and a Race Track, etc. Directors: H. R. Covey, Jasper N. Killip, James R. Dickey, E. M. Chase and Daniel Z. Yost. Capital stock, $260,000.

The Alabama Silver M. Co.—July 13. Location: Panamint mining district, Inyo county. Capital stock, $6,000,000, in shares of $100. Directors: John Copely and J. N. Parker, Inyo; J. A. Pritchard, S. A. Raymond and W. E. Hale, San Franolsco.

Hudson River Silver Mining Co.—July 13. Location: Panamint district. Capital, $6,000,000. Directors: John Copley, D. G. Tipton, J. A. Pritchard, S. A. Raymond and W. E. Hale.

Dempsey Silver Mining Co.—July 13. Location: Panamint district. Capital, $6,000,000. Directors: John Copely, J. A. Pritchard, Henry Gibbons, S. A. Raymond and W. E. Hale.

Harrison Silver M. Co.—July 13. Location: Panamint district. Capital, $6,000,000. Directors: W. S. Hobart, J. A. Pritchard, S. A. Raymend, W. E. Hale and John Copely.

Good Friday M. Co.—July 16. Location: Placer county. Directors: J. M. Bogart, Mark Leonard, W. F. Bogart, A. Treadwell and R. B. Noyes. Capital stock, $1,250,000.

Red Hill Hydraulic M. and Water Co.—July 16. Object: To mine for gold and other metals, sell water, transport wood, etc. Directors: J. G. Swift, Geo. Swift, W. B. Douglass, G. F. Whitem and T. B. Wingard. Capital stock, $500,000.

James Lick M. Co.—July 16. Object: Mining for gold and silver, huy and sell the same, etc. Directors: Wm. Gibbons, James Ellsworth, H. C. Blake, Robert Armstrong and James Du Bois. Capital stock, $1,000,000.

The following articles of incorporation were filed in the office of the Secretary of State, Sacramento:

Tauckee Reduction and Refining Co.—Capital stock, $350,000, in shares of $100 each.

Cedar and Pilot Knob Quicksilver M. Co.—Capital stock, $3,000,000, in shares of $100 each.

Meetings and Elections.

Best & Belcher M. Co.—July 13. Directors: J. C. Flood, W. S. O'Brien, Edward Barton, L. S. Rose and Robert Sherwood; William Willis, Secretary; James G. Fair, Superintendent. Eight assessments of $225,000 have already heen collected on account of this mine, and another of $11,200 was levied at the close of the meeting on Monday, to further prosecute the discovery for pay ore. The claim is hetween Gonld & Curry and Consolidated Virginia, and consists of 224 feet.

Central Pacific Railroad Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., Rohert Robinson, C. H. Cummings, harles Crocker.

Sacramento Valley Railroad Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., C. H. Cummings.

California Pacific Railroad Co.—July 16. Directors: George E. Gray, R. P. Hammond, Moses Hopkins, Jo. B. Gunn, C. J. Robinson, N. T. Smith, J. L. Willcutt.

Stockton and Copperopolis Railroad Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., Robert Robinson, C. H. Cummings, N. T. Smith.

Stockton and Visalia Railroad Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., Rohert Rohinson, C. H. Cummings, N. T. Smith.

San Pablo and Tulare Railroad Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., C. H. Cummings.

Northern Railway Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., C. H. Cummings.

Terminal Railroad Co.—July 16. Directors: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Miller, Jr., Robert Robinson, E. J. Rohinson, Chas. Crocker.

Quicksilver in Mexico.—There is no metal which cansee more attention in Mexico than quicksilver; and ite high price, ae well as the premiums offered by several States, has doubled ths exertione to find new deposits; the lateet discoveries of thie kind are at Hnitzuero, State of Guerrero, and if report ie trne this new mining district will vie with Almaden.

Six echoonere are employed in shipping chrome iron ore from Petalnma to San Francisco, where it is to be pnt on the ship "General McClellan," preparatory to ehipment to New York.

Mining Summary.

The following ia mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

Ite Progress. — *Chronicle*, Jnly 11: The McGlew farnace, at the M. and N. W. Co.'s mill, below Bnlliona, ie progressing finely under the enperintendence of the inventor, who proposes to show, in abont two weeks, a successful reduction of our rebellione ores. The progrees of thie furnace ie watched with unnsnal interest.

AMADOR COUNTY.

The Lincoln Ditch.—*Dispatch*, July 11: The work of cntting the Linoln ditch was finished last Friday, and the water will be let into it in a few daye. The ditch ie eeventeen milee in length, and was constrnoted for the pnrpoee of furnishing water to the celebrated Lincoln mine, at Sntter creek. The water ie taken from the month of Grase Valley creek.

CALAVERAS COUNTY.

Rich Specimens.—*Chronicle*, Jnly 11: Some very rich specimens of qnartz, taken from the Wallace & Fergnson mine, at Sheep ranch, were on exhibition recently. The rock taken from the Wallace & Ferguson averages better than any other mine in the State, paying $75 per ton. The ledge hae been opened for a dis-

tance of 1,400 feet, showing a continuous vein of unprecedentedly rich ore.

Good Clean-up.—Veith & Co., the Tunnel ridge hydraulicists, have recently made another good clean-up after a short run. The yield of the mino was $2,000, in a very short space of time.

EL DORADO COUNTY.

Mining.—El Dorado *Republican*, July 11: Mining operations are being diligently prosecuted all about us, and although but little is said, miners generally look and act as though everything was satisfactory.

INYO COUNTY.

Bullion.—*Independent*, July 4: Since January last 65,000 hurs of bullion have been shipped on teams from Cartago. The teams take 400 bars every day, which is about the number turned out hy the two Cerro Gordo furnaces. There are now 5,000 burs on hands.

LAKE COUNTY.

Quicksilver Mines.—*Bee*, July 9: The Great Western Co. have just completed a 30-ton furnace, and expect to run out from 600 to 800 flasks of quicksilver per month.

The American mine will soon have their reduction works finished, and will undouhtedly have plonty of metal to ship, as they have fine ore in large quantities.

The Kearsarge is developing finely. They have one small retort now in operation, and intend putting up others soon.

The London, Almadra und Pacifio mines, on the "No. 2" lode, are working a large force of men in the development of the same.

LOS ANGELES COUNTY.

Petroleum.—*Express*, July 7: The Los Angeles Petroleum Refining Company are proceeding with energy to organize their oil works in connection with the Carreras process, and in a short time we may look to see Los Angeles illuminating oils amoug the regular commeroial articles of this market. In this connection we have nothing hut good news from the oil regiou. The prospecting is proeeeding satisfactorily.

MENDOCINO COUNTY.

Quicksilver.—*Independent Dispatch*, July 10: We lesrn that work is beiug vigorously prosecuted on the Sodu Spriug quicksilver mine, near Anderson valley, and that late assays show a prospect of five per cent. of quicksilver. The McGimsey lead, about one and a half miles from the Soda Spriug lead, is also reported to be good.

NAPA COUNTY.

Calistooa Items.—*Free Press*, July 11: Recent explorations have developed excellent cinnabar indioations in Alexander valley, on Sunsal creek, about 20 miles west of this place. At least a hundred looations have already been mude.

One of the largest yields of qnicksilver yet recorded in Napa county is that of the California compauy. On last Satnrday they shipped 67 flasks of this metal from their miue, all the result of one week's work.

NEVADA COUNTY.

Dartmouth Mine.—The Dartmouth company have closed down their mill for the preaent, for want of water—the mill being run by that power. The explorations carried on during the last year satisfy the company that they have a large and rich hody of blue lead, sulphur, oement gravel. A thirty-six-hour run on promiscuous gravel, not selected gravel, gave the handsome yield of $600. They intend to enlarge their preaent working shaft so as to raise the gravel by car and cage, instead by buckets aa at present. The Dartmouth's finonoial standing is first-olaas. always promptly paying all bills on the 5th day of each month, and the managemeut of mill and mine is most energetically and efficiently done by Captaiu Miller, the Superintendent.

Milton Mining Company.—The Milton company operates in French Corral neighborhood, in this county. The Manzanito tunnel belonging to the Milton company will he 1,700 ft. in length when completed. Only about 150 ft. of the tunnel remains to he run, and that is being worked on two faces from a shaft. From the mouth of the tunnel a grade is being made for the purpose of setting the flume. This grade will be a mile or more long and will run to the Yuba river. When the tunnel is completed a very large body of rich gravel will be opened for profitable work.

Idaho.—Grass Valley *Union*, July 13: The old abaft of the Idaho mine is being repaired and re-timbered for the purpose of putting a pump down to keep the mine free from wuter. There is not a great deal of water there now, but as the nndergrouud works become more extensive of course the amount becomes greater.

Seven-Thirty Mine.—A rich strike has been made at the Seven-Thirty mine. Some of the heaviest and best rock we have ever seen was brought from the mine yesterday. The three owners are in luck, and they are the kind of men who deserve fortunes—Rohert McCook, David McCook and Elmer Sunford being the owners.

New York Hill.—Work is stoadily progressing on this mine in both tunnels, aud good ledges are found in hoth. Very satisfactory results have come from all the crushings of ore, all paying a handsome profit on expenses. The lower tunnel is in ahout 500 ft. The present contraot will carry the tunnel 200 ft., with a bsck of 350 ft. An air shaft is nearly completed in the tunnel. Rich specimens are beiug so constantly taken out that they are no longer chronicled.

A Good Clean-up.—Nevada *Transcript*, July 14: We heard it stated arouud town that the Manzanita mine took out at its last clean-up, the nice little sum of $30,000. Such clean-ups are oommon around the county, but we cannot alwaye obtain the figures.

Pushing Ahead.—The ditoh being out by the Blue Tent Consolidated compsny, under the euperintendence of C. W. Tozer, is being pushed ahead as fast as possible. The oompany are now working a huudred meu on the line of the ditoh. There will be four miles of fluming to build, and several long tuunels to run. They have one mile of flume already completed.

PLACER COUNTY.

Dutch Flat.—*Herald*, July 11: Parties from Dutch Flat inform us that the tunnel, which has been run from Bear river to tap the bottom of the deep gravel deposits near Dutch Flat, is so far advunced as to be serviceable. They have already commenced piping on a deep stratum, the tailings from which are washed out through this tunnel.

From a short run, of 100 tons of average rock, from the Orleans mine, there was oleaned up last Thursday, what is safely estimated at $4,500.

PLUMAS COUNTY.

Sale of the Buckeye.—*National*, July 4: We learn that the Buckeye claims, at Sawpit Flat, were sold last week to a Mr. Breed, of New York, for the sum of $50,000.

Conly & Gowell have stripped about six acres of hed-rock in their La Porte hydraulic claims this season. They are now hiring a large number of hands, and cleaniug np.

The Bluckhawk company (Miller, Musick & Shaffer), are making first-rate wages—from five to ten dollars per day.

SISKIYOU COUNTY.

Good Yield.—Yreka *Union*, July 11: The Bunker Hill company on the Klamath below Happy camp oleaned up $800, as the result of six days run.

Cornish & Clurk are running a tunnel to strike their ledge at a lower level. The quartz taken from this ledge has heen about the richest of any ever found in the conuty. Some 60 or 70 tons croshed about a year ago averaged a good deal over $100 to the ton.

TULARE COUNTY.

Tulare.—Visalia *Delta*, July 9: That exaggerating reports should he set afloat in regard to the new mines is nothing more than should be expected. The report that $300,000 had been offered for the discovery clsim on the White Chief was, of course, almost pure fabrication. There is much truth in the statement, however, that the agent of a rich mining company is on the ground, and is willing to contract for the claim in the sum mentioned if snbsequent developments should prove it as rich as a certain other claim owned hy the company. The report that Creighton offered $50,000 for the Lsdy Franklin is not so. Good judges ure of the opinion that the White Chief is a large lead; but a large stream of water sinks in it, and coming out some two miles below, it would require a lsrge outlay of oapital to drain the lead below this water level. It is helieved, however, that the lead will ultimately prove one of the most valuahle discoveries of modern times.

TUOLUMNE COUNTY.

Tuolumne Silver.—*Independent*, July 11: Jack Kuowles haa started for the Summit Silver vein with six men, determined to try its hottom.

The Knox & Boyle is paying splendidly. For the months of April and May, they shipped bullion amounting to over $10,000. The shaft is now over 400 feet down and the rock shows first-class.

The Heslep mine started up on the 16th of June. They are takiug ont rock on top now, and will commence taking out of the shaft in about a week. Everythiug is ready for the latter. The mine, worked as it ahould be, is a valnable one, and we hope those interested will give it a chance to show itself.

Good Quartz.—P. Eastman, of Cherokee, has a vein of quartz six feet wide, which he calls the "Mother Vein," sitnated near the Laurel mill. Two tons were tested in his arrastra from a 60 ft. incline from a 300 ft. tunnel, and panned out $25.50. We hope, as he goes down on it, it will increase in size and quality.

The Telegraph Mine.—Superintendent Murphy has twenty men at work in and about this mine. Two tunnels are being run on the hill aide. The upper tunnel, which is about 500 ft. in, has struck the vein, and they have already run 140 ft. on the chute and are getting out $25 and $30 rook; are every day expecting to strike the chute in the lower tunnel. The ten-stamp mill which is being erected will be in readiuess to crush in about three weeks, when another ten-stamps will be added. Tulloch's self-feeders will be employed in the mill.

Tulloch's Self Feeders.—*Union Democrat*, July 11: The proprietors of the Spring Gulch mine recently placed two of these "feeders" in their mill. They report them as being all tbat is claimed hy the iuventor, saving the labor of a man and keepiug the battery evenly fed, with great saving in the wear of shoes. Mr. Whitto informs us it is one of the best, simplest and most practical improvements he has seen introduced to facilitate the crushing of ore, during his experience of many years. The same is said of them by Judge Preston, who runs them in the various mines under his control.

TRINITY COUNTY.

Indian Creek Quartz.—*Journal*, July 11: Further developments on the Bullychoop ledge are of an encouraging character. The vein is from two to four feet in width and well defined. An assay from average rock shows $241.17 gold to the ton. It is the intention of the locators to prospect the ledge extensively.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, July 9: Daily yield 300 tons of ore. The ore hreasts on the 1,300-foot levels are both looking well and yielding splendidly. The bottom of the winze from the 1,300 to connect with the 1,400-ft level is still in rich ore. Three drifts are being extended on the 1,400-ft level for the development of the ore hody—one north, one south and another east, all of which are in rich ore, with no indication whatever of a ohange. The north winze from the 1,400-ft level is sinking through high grsde ore. The grading and other necessary preparations for the erection of u new 60-stamp mill, is making rapid progress.

Hale & Norcross.—Sinking the main incline below the 2,000-ft level goes steadily on. A large water-tsnk for the pump is heing erected 50 feet below the 2,000-ft station. Both the main north and west drifts are being driveu vigorously ahead, with favorable prospects of ore developments. The ore found in the west drift on this level last week, although of excellent qnality, proved to be only two or three feet in thickness, but may yet lead to the development of a large and extensive hody.

Ophir.—The suit in the Distriot Court for the settlement of the dispute in regard to the control of this miue has been postponed until the 18th. In the meantime work has again heen resumed in the miue under the control of the present superintendent, Samuel T. Curtis. This is highly gratifying, as, hsd the mine remained shut down three days more, the Empire State mill, which was being run on the reserve ore in the dumps, would also have been ohliged to stop. The extraction of ore from the ore breasts on both the 1,300 and 1,465-foot levels has been resumed. Sinking the winze from the 1,465-foot level, to connect with the up-raise from the 1,700-foot, has been stopped on acoonnt of the intense heat.

Gould & Curry.—The face of the north drift on the 1,500-ft. level is in low grade quartz, aud shows a slight improvement since our last report. Sinkiug the double winze below the 1,000-ft. station is making good headway, with some good indications in the hottom. The east drift, spoken of in our last report as just having beeu commenced, was run in a distance of 8 ft., when it was discontinned on acconnt of nndoubted indiostions of the close proximity of a heavy body of water.

Globe Consolidated.—The ore body in the north drift from the head of the incline has widened out to 15 and 16 ft. in width, and is of an excellent quality. The winze from this drift is down 69 ft., also in ore of a fine quality. The pay streak in the hottom of this winze is about 5 ft. in width, the grain of the quartz coarse, and has a very promisiug look. The grading for the erection of the new 20-stamp mill has been oommenced, and is being pushed with all the vigor possihle. Daily yield, 20 tons of ore.

Sierra Nevada.—The erection of the new hoisting and pumping machinery is making steady and very favorable progress. The hydranlic worka are doiug good execution, and continue to work spleuidly. Many pieces of ore extremely rich in gold are found, and it is the opinion of many that a rich chimney will yet be found somewhere in the vicinity. Daily yield, 60 tons of ore, keeping the mill steadily running. The ore hreasts are all looking well and yielding finely.

Yellow Jacket.—The work of cross-outting on the 1,540-ft. level is being prosecuted vigorously. The winze which is being sunk from this level, has attained a depth of 120 ft. The oompany have commenced sinking a sump below the 1,740-ft. level station. As soon as this sump is finished, prospecting that level will be commenced.

Belcher.—Daily yield, 550 tons of ore. The ore hreasts throughout the entire mine are looking well and yielding splendidly. Sinking the main incline is making fair progress, notwithstanding the extreme hardness of the rock. It is now down 20 feet below the 1,500-ft. level. The works are to be ahut down for a day or two, to ohange some of the hoisting gear, aud put in new rails in the main inoline shaft. A spleudid new cable rope is now on its way from San Francisco, and will be put in as soon as it arrives.

Crown Point.—Daily yield, 550 tons of ore, which is heing extracted from the 1,000, 1,200, 1,300 and 1,400-ft. levels. Since our last report, another wiuze, called the south winze, has been started from the 1,400-ft. level, and is now down 14 feet in good ore. The various ore hreasts throughout the mine are looking as well as nsual.

Chollar-Potosi.—Daily yield, 90 tons of ore, the assay value of which is $30 per ton. The cross-cuts, No. 1 and No. 2, at the fourth station level, have both reached the west country rock without developing anything of material value.

Savage.—Sinking the main shaft for the 2,100-ft. level is makiug steady progress, the rock in the hottom blasting out finely. The main south drift on the 2,000 ft. level has been enlarged and timhered up in good working condition, and is now being steadily driven ahead to connect with the north drift on the same level from the Hale & Norcross.

Goodman.—This mine is situated about a mile west of Silver City, near the Red Jacket mine and the American Flat tunnel of the railroad. The company have sunk a shaft about 160 feet, developing a good-sized ledge, which assays well in silver and gold. The Goodman oompany have a valuable piece of mining property, which only lacks full and proper development.

Julia.—Work on the 900-ft. level has beeu discontinued for u short time, pending the erection of the new pumping machinery. The excavatiou for the machinery is nearly oompleted.

Baltimore Consolidated.—The water has been drained from the shaft and the sinking resumed, which is now making favorable headwsy. The new machinery is all working with the utmost perfection, and the development of the new level is being looked forward to with intense and hopeful expectation.

Imperial-Empire.—Sinking the main incline is makiug fair progress, and has only 8 ft. more to sink, when everything will he in readiness to open the 2,000-ft. station. The south drift, from the main east crossout, has penetrated the ore body, mentioned in our last report, 40 ft. showing it to be $30 to $35 ore, and giving fair promise of the development of a large body.

Utah.—The flow of water has ountinued stronger in the shaft than wae at first suspected. However, the steady and persistent efforts of the management are beginning to tell, and the water is slowly and gradually being drained.

Justice.—Sinking the main inoline is making good progress. The extraction of ore from the Waller Defeat shaft is ountinued at the rate of 40 tons per day. The excavations for the foundation of the new hoisting works and machinery is making steady and favorable progress.

Caledonia.—Sinking the main shaft is makiug favorable progress. It is now down 35 ft. helow the 800-ft. level.

Leo.—The ledge is becoming somewhat softer again in the face of the tunnel, and a better quality of qnartz is met with. The ledge is hearing more nearly a north and south course than at any time heretofore, and the indioations are more favorable at present than they have been for some time past.

Phil. Sheridan.—New shaft down 97 ft. today. The reqnisite steam hoisting machinery will be put in position the last of this month. No water interferes with sinking.

Dayton.—Cutting out and enlarging the shaft for a third compartment is nearly completed to the level of the drain tunnel. Preparation for the erection of the new machinery goes steadily on.

Tyler.—The main east drift has cut a fine vein of quartz, 2 or 3 feet in thickuess, which carries hoth gold and silver in very promising quantities. This streak is now being fully prospected, as the ohances are excellent for its lesding to a permanent and paying body.

Overman.—There is no change, if we except the progress made on the north drift on the 1,200-ft. level.

Succor.—The erection of the new hoisting works is making good headway. One of the hoisting engines will he in readiness to start up again in a very few days.

Daney.—The main west drift on the 400-foot level is in 149 feet from the shaft, the face in hard hlasting rock.

Silver Hill.—The oross-cut from the south drift, on the first level, is still in ore. The face of the main south drift on the second station level is still in white qnartz and low grade ore.

Nevada.—Still running ahead in the new tnnnel, with good progress, in excellent working gronnd. This tunnel will soon be into the ledge itself, and follow it until it reaches the old workings, which are in good pay ore 100 feet above.

Buckeye.—The south drift at the first station is rapidly approaching the south winze. As soon as the connection is completed hetween thia drift and the winze, it is the intention to commence the extraction of ore from that level.

Lady Bryan.—Sinking the new shaft is making good headway. There is no water to interfere.

Alamo.—Sinking the new shaft on the body of ore, struck a few days since, is making good progress, with every indication of its developing into a fine and extensive body.

Occidental.—Sinking the winze from the tunnel level is making good progress, the hottom still in fine ore. The new hoisting machinery is working to perfection.

Knickerbocker.—The water has been drained from the shaft and the sinking resumed.

Woodville.—Siuking the prospecting winze below the 300-ft. level is making fair progress.

New York.—Sinking the shaft has been again resumed, and is making favorable progress. Driving the east drift at the 600-ft. level has been commenced.

Florida.—The shaft is down 145 feet. The machiuery worka well.

California.—Driving hoth the north drifts, on the 1,400 and 1,500-ft. levels is makiug good headway.

Dardanelles.—The new ehaft is down 45 feet, the bottom in hard blasting ground.

Bullion.—The north drift ou the 1,700-ft. level is making favorable progress.

Mint.—Sinkiug the main shaft is making the usual good progress.

Sutro.—Driving the main west tunnel is still making rapid progress.

Kossuth.—The erection of the new hoisting and pumpiug machiuery is making good progress.

Pictou.—Tunnel driving ahead. Rock in face somewhat harder. No water.

Lady Washington.—Work progressiug as usual.

Ten Thousand Feet Above the Level of the Sea.

The altitude of Belmont, Nevada, is 8,400 feet above the level of the sea, being 2,000 feet higher than the city of Austin. Twelve or fifteen miles north of Belmont is a high mountain, the altitude of which is estimated to be 11,000 feet, and at the base of it are located those flourishing rich mines, known as the Jefferson mines, so recently discovered, and upon which work is now being vigorously prosecuted.

One thousand feet from the top of Mount Jefferson, and 10,000 feet above the sea, is a plateau or piece of table land from which a bird's-eye view can be had of the thriving little town of Belmont, with its mines, mills and hoisting works; and beyond, as far as the eye can reach, to the south, east and west, is a vast expanse of mineral wealth, that lies slumbering, as it were, in rocky beds that line range after range of mountains, stretching far to the southward in sinuous, undulating lines until lost in the dimness of space.

What would our friends that live down by the tidal waves think and say could they look directly up over-head to given point a mile and a half or two miles into the sky, and tell them that there, on a level with that point, 500 miles eastward, was Belmont, Nevada, and many other towns that are more than a mile above them?

In most of the larger valleys water is found in abundance, flowing from the mountain sides; arable land suitable for the horticulturist and grass for graziers, is plentiful. Here, as civilization advances into the interior, farms and stock ranches are located in the valleys and cañons, and wood ranches in the mountains. Salt marshes exist in many places, from which large quantities of salt are gathered, to be used in the extraction of ores in the mills and furnaces. Borax mines are also found, besides copper, lead and iron. Notwithstanding the bleak and barren aspect which the country first presents to the beholder when traveling over the alkali flats and through the rocky cañons, Providence seems to have ordained that it shall not be the least valued in point of wealth and natural resources, having so arranged and adapted the products of the country as to produce in one place what it lacks in another towards supplying the wants of the hardy pioneers, upon whose shoulders devolves the arduous task of unearthing and bringing to light those precious metals that are so quickly changed into the circulating medium so much coveted by the outside world, and which so naturally finds its way into the coffers of the monopolist.

One of the many features of this country is, that here and there, covering an area of hundreds of miles, can be seen those high peaks and mountains towering up above the rest, like sentinels, as it were, guarding hidden treasures that lie beneath, and protecting those that are folded in their rocky embrace. It is a noticeable fact, that wherever these large peaks or mountains are found, so also is silver ore, in more or less quantities, and some proving very rich; and yet it is not to be argued that all the silver lodes exist near these places, for many ledges of silver-bearing quartz have been discovered in lower ranges of mountains that have proven quite rich; but we may very well believe that these high points only serve as outposts, showing, in their silent way, the boundaries of mineral belts; and it is to these landmarks that the prospector directs his course, when visions of grander discoveries, to be made in other localities, persuade him to shoulder his pick and shovel, and travel.

It is very evident that at some anterior date, probably centuries ago, this whole country, comprising the Pacific slope, has been thrown into terrible convulsions at different times, by the natural workings of the internal fires and gases which exist in all mineral countries; consequently there was bound to be more or less of the mineral quartz left uncovered on and around the highest peaks. This, then, is undoubtedly the reason why float rock and ledges happen to be first discovered in and around these places.

That the entire southwestern portion of Nevada is equally as rich in mineral resources as the rest of the State, there can be no question or doubt. Does not the finger of destiny point in this direction, indicating that it will not be many years before this section will be teeming with life and activity, from the overflowed population of the Eastern States and Europe, who are forced to leave their fatherland and seek a foothold and home in the Far West? Ledges now unthought of will be discovered, towns and cities will spring up, year after year, as the magic wand of industry and enterprise waves over the land in its onward course. Even now many old districts that were discovered several years ago, and neglected or abandoned for richer fields, are beginning to attract renewed attention from capital, which, through hard experience, is discovering new characteristics in those long neglected ores, that promise safer investments, with greater percentages on the money invested, that can be found in the older localities. And so it will be as the age of science and metallurgy advances.

In order to show what sudden transitions are liable to take place in localities, we will take the mines of Eureka district for example: A few years ago these mines were discovered and work done on a great many, but all seemingly to no purpose, and finally the original locators had to abandon them, discouraged and disheartened at their failure. But now, presto, look at the change! Those same mines are worth their millions, and a city has risen second to none but one in the State. But will this story of wondrous enchantment end here? May not Morey, Hot Creek, Reveille, Ione, San Antonio, Ellsworth and Twin River districts do likewise when their turn comes in the dim future? Austin still asserts her mining dignity in the catalogue of mines, although she has been frequently down to the bed-rock during the last ten years, but, like a cork in the water, she will come up again and swim on top. Tybo is just beginning to make itself heard through a silver trumpet, to let us know that it is sleeping no more. The mines of Jefferson, Spanish Belt and Belmont speak for themselves every day. Alida valley and Gold mountain, slumbering so long near the shades of Death valley, far to the south of here, have tumbled out of their cradle at last, and though still in infancy, has shown a decided inclination to walk in the silvery girdle; and now, as General Page has extended a helping hand, we may soon hear favorable news from that remote district. Montezuma, Silver Peak, Cerro Gordo and Columbus are still on picket duty, awaiting the vanguard of progress to come up and reward them for their long and faithful watchings.—*Belmont Courier.*

Mining at Dutch Flat and Gold Run.

We condense the following matter of general interest from an extended article in the *Placer Argus:*

The mining district of Dutch Flat and Gold Run, for the two towns are so close together and their mining interests are so closely blended that we shall treat them as one, has long been noted for its yield of the precious metals, and for the certainty with which the hardy miner could count on a return for his labor. Early in the history of placer mining in this State, the gulches and ravines were filled with miners, and large amounts of gold were taken out. The existence of the great gravel banks, and the fact that they contained gold was well known at the time, but the want of water prevented working them on a scale of sufficient magnitude to pay.

Mining at Gold Run

By the hydraulic process first begun in the spring of 1865, the Bear river ditch, supplying about 650 inches of water, having been brought in. The yield that year was light, but in the succeeding years of 1866 and 1867 work was prosecuted very extensively, and about $600,000 was taken out each year. In 1868 a party of miners owning these claims bought the Beaver river ditch and organized the

Gold Run Ditch and Mining Co.,

And it is now the largest operation in that place. The company incorporated in 1870. The capital stock is $905,000, and is all owned by citizens of Gold Run and Dutch Flat. Allen Towle is President, H. H. Brown is Secretary and Treasurer, and J. L. Gould is General Superintendent. They have over $300,000 invested in mining property, of which $80,000 is in ditches. Their water comes from Bear and South Yuba rivers through 28 miles of ditches. This season they have had plenty of water, and expect to run seven or eight months. They are working five claims, use 2,000 inches of water and employ 40 men. They own the following claims:

Indiana Hill, 65 acres; North Star, 65 acres; two-fifths of the Druid, eight acres; one-half of the Gold Run, 70 acres; Church and Golden Gate, 35 acres; Kearsarge, 30 acres; Bay State No. 2, 25 acres; Pinetop, 30 acres. Thus far the surface gravel to the depth of 100 to 175 feet only, has been worked, the lower stratum of over 200 feet in thickness not being workable for want of fall to carry off the tailings. The company are now engaged in the prosecution of an enterprise that cannot fail to have a very beneficial influence on the mining interests of this section. For several years the yield of gold has been declining, and the surface beds are rapidly being worked out. The Gold Run company only has enough of ground to keep its men employed for about two years, and if something is not done, the day of prosperity would soon be over, and the prosperous towns of Gold Run and Dutch Flat would soon become dilapidated and deserted. The richest beds of gravel, fully 200 feet in depth, are yet untouched. To procure the necessary fall, and enable them to work these rich beds the Gold Run Co. is running a tunnel over 3,000 feet in length through the mountain, at a depth of 600 feet below the crest of the ridge. The lower end of this tunnel opens into Cañon creek, while the head will open directly under the great deposits of blue gravel and furnishing means of working them to the bed rock. Clambering down the precipitous sides of the cañon, we found an active little engine pumping away condensing air by which the drills are driven. A very steep and narrow wagon-road has been blasted in the rock, and the necessary buildings are perched on projecting crags. Wood is supplied by a slide on the opposite side of the cañon, and water from a reservoir, situated some 400 feet above the engine house. The main tunnel, which is 12 feet wide by 9 feet in hight, has been driven a distance of 600 feet, and when completed will be 2,200 feet in length. At a distance of 454 feet from the lower end, a branch tunnel leaves the main cut, and is now in about 300 feet from the point of intersection. The branch is eight feet square, and will be about 1,000 feet long. The whole force is now at work on the branch, which will be ready for use by the first of January, when washing will begin. The branch is run for the purpose of reaching some claims not tapped by the main tunnel. As soon as it is finished, work will be resumed on the main cut, and it will be put through in about two years, or by the time the surface gravel belonging to the company is exhausted. The Burleigh drill, driven by compressed air is the effective agent in penetrating the rock, and it is walking into the mountain at the rapid rate of 100 feet per month, on an average. Twenty-five men are employed, and some $3,000 per month is disbursed in paying expenses, and supplying the necessary materials. The total cost of the tunnel is estimated at $125,000. The vast importance of this enterprise is manifest when we consider that the ground, which by its aid alone can be worked, is far richer than the best of the gravel that has already been washed, and that there is enough of it to employ all the water that can be had for the next century. Shafts have been sunk 200 feet to the bed-rock, and good pay found the whole distance. Under the influence of this great work which is to unlock the hitherto inaccessible riches of the district, every kind of business is brightening up, and the future prospects of the towns dependent on the mines are proportionately improved. In addition to the Gold Run company the following parties are engaged in mining:

Hoskins & Brother are working a claim of 70 acres. They employ 15 men and use 600 inches of water.

The Fishhawk Company have a claim of 40 acres. Use 550 inches of water and employ 10 men.

Sachs & Company's claim contains 100 acres. They use 350 inches of water and employ six men.

O. Harkness uses 500 inches of water, employs seven men, and works a claim of 40 acres.

The Indiana Hill Blue Gravel Company is drifting on the channel, and crushing the gravel in an eight-stamp mill, driven by water-power. It is working 30 hands and is doing well. J. F. Moody works the tailings of all these claims; and, we should judge, is making a better thing of it than any of the claims. He owns about 3,000 feet of the cañon, in which he has fitted flumes and undercurrents, and now has nothing to do but to catch the gold that escapes the workmen above. His cleanups have been of the most satisfactory character, and this season's work will probably net him a larger amount than usual. In fact, all the claims have paid well, and an expression of satisfaction rests on the countenances of all the miners.

The Cedar Creek Gold Mining Company is mentioned at length in another column.

Sacramento Smelting Works Commencing Operations.

Instead of a delay of several days, as anticipated, from striking the hardpan in the artesian well, at the smelting works, it was bored through on Tuesday night, and operations in smelting commenced. An abundant supply of good water, free from alkali, and very cold, was struck below the hardpan, and a donkey-engine is employed to pump it into the pipes, from which it is taken through hydrants for immediate use. About all the impurity in the water is a slight impregnation of iron—not enough to hurt in any way, however. The fires were started in the furnace—but one of the two furnaces is run at yet—at two o'clock yesterday morning, and at seven o'clock the metal commenced flowing from the bottom. Since then, there has been a continuous flow. During the forenoon the directors of the company visited the works, examined their workings, and expressed satisfaction with their operations. There are now fifteen men employed at the works, but it will require thirty to run them shortly. Several of the new hands gave out after a few hours' work, the heat being too intense. The fires have been kept burning night and day. The ore is spread in layers upon the floor and mixed with different fluxes, scrap iron, limestone and slag. A charge is then cast into the furnace for reduction. The charge consists of two bushels of charcoal and two hundred pounds of the ore mixture. When reduced to a liquid state, the vents are opened, and the molten metal is allowed to run into large iron pots. It is then poured into iron moulds and allowed to cool. Each bar of bullion thus produced weighs about ninety-four pounds. The metal is a mixture of silver and lead, and is ready for the separating process. This is as far as the work can be done here. The slag, or melted rock, dirt, etc., flows from a vent above that from which the metal flows, and on another side, into iron pots securely fixed on trucks, from which it is dumped into the slough. At 12 M. three tons of bullion had been run out, and by 7 P. M. one hundred and fifty bars were made which is the result of the first twenty-four hours' run. A bath-house has been put up for the use of the employes, which is now ready for use. The works appear to be a success, so far as the work is concerned.—*Sacramento Union, July 9th.*

Eight car-loads of new steel rails arrived at Gold Hill, recently, from Carson, for the Virginia and Truckee railroad. A gang of men will soon commence laying them from Gold Hill toward Carson. The road between Virginia City and Gold Hill has already been laid with them.

The Perkins mill, at the mouth of Dixie cañon, Plumas county, is now running splendidly, and the rock is paying well. A run of five days last week turned out 100 ounces of amalgam.

The Cedar Creek Mines.

From an article in the Placer *Argus* we take the following concerning the property of the Cedar Creek Gold Mines Company, the principal concern doing business at Dutch Flat: It is an English corporation; having a capital of $200,000 and is noted throughout the country for its enterprise and liberality. The principal office is in London, where the President, George Batters, and the Secretary, W. J. Lavington, reside. Its business headquarters are at Dutch flat, and the management of its extensive works is intrusted to T. B. Ludlum, an energetic young Illinoisan, who has been a citizen of our county so long that he feels like a native. The company is prosecuting its work with vigor, and employs a large force of hands. The old Placer county canal, after passing into its hands, has been improved and extended until the company now owns about 60 miles of ditches. The capacity of the main ditch is 6,000 inches of water, the greater portion of which is used by the company in operating its claims. Of these the principal are the Pacific, 40 acres, the Central, 30 acres, Jehoshaphat, 20 acres, half of the Gold run, the Home Ticket, 20 acres, the Gem, 15 acres, etc. Altogether it owns 32 claims, comprising some 200 acres of mining ground, employs 150 men, and uses 3,800 inches of water, besides selling 1,450 inches twenty-four-hour water to outside parties. It is also engaged in running a

Bedrock Tunnel

For, the purpose of tapping the Dutch Flat channel, work on which has been progressing for some time with favorable results. The tunnel when completed will be 3,000 feet in length and 8 feet by 8 in size. It is now in 660, and has reached the first shaft, from which washing will begin about the first of this month. In prosecuting this important work 18 men are employed. Three Burleigh drills are used, the air being compressed by water-power. The importance of the Burleigh drilling machines to the mining interests of the State have been pretty thoroughly tested here and at Gold Run. Notwithstanding their great cost they are indispensable to the successful prosecution of such heavy work. The drill and machinery in use by the Cedar Creek Company cost $12,000, and while the work of driving a tunnel is not materially cheapened by their use, the great saving of time outweighs every other consideration and renders their general use inevitable.

The beginning of the work in the blue gravel will be watched with interest by all parties, as on its success the future prosperity of this district depends. The beds are known to contain coarser gold than the surface gravel, and are supposed to be richer, but they will be harder to work.

A blast of 300 kegs of powder is now about to be fired in the Yankee Jim claim, which is being prepared for working. It is expected to open up a large bed of gravel for working. Besides the Cedar Creek Co., the South Yuba Canal Co. is supplying water to the miners, its canal having a capacity of 3,000 inches. The water is taken from the South Yuba river, and is carried through about 25 miles of ditches.

The following claims are being worked: North Star No. 2, owned by Lakamp & Voight. They employ ten men and use 500 inches of water. Their claim is paying well. The Red Bank Co. have 60 acres of gravel left, on which it is working five men and using 450 inches of water. The Summit claim runs seven men and 500 inches of water. The Somerset claim, owned by Staples & Bro., works eight men and uses 450 inches of water. Kidder employs five men and uses 350 inches of water.

The general report is that more men are employed than ever before, that the mines are paying well, and that the prospects for the future are exceptionally brilliant.

Pacific Company.—The mines of this company are looking better at the present time than at any time for months past. The last ore worked—which came from strata in the north Star ledge below the 400-ft. level—worked $1,650 per ton at Manhattan mill. Work is being prosecuted in the cross-cut, below the break, into the north Star ledge. Small strata of high grade ore, are being encountered in the ledge, which widens as progress is being made, and the prospects are good for a large body of high grade ore ere long. We are pleased to note that the mines of Lander hill, almost without exception, are at this time looking better than at any period in their history. The Manhattan mill is pushed forward to its utmost capacity, and the extraction of ore is largely in excess of the reducing facilities of the district. One thing has been demonstrated by the system of mining pursued by the Manhattan company: That as depth is attained on our mines they increase in extent and richness. All that is required to make Reese river district one of the most prominent bullion producing sections of the State is energy and capital for the development of our mines. Mining in Lander hill is no longer an experiment; it is an established fact that our ledges are permanent and rich and improve with depth.—*Reese River Reveille.*

Eagle Mine.—Again it becomes our duty to chronicle another improvement in the Eagle mine. Now, at a depth of 60 feet, the ledge is ten feet eight inches wide, carrying a four-foot streak of ore which assays $428 in silver to the ton. Will the San Francisco expert who pronounced it worthless please take notice?—*Silver State.*

Useful Information.

An Architectural Infliction.

A few years ago the monotonous style of roof used in architectnre was agreeably varied by the introdnction of what is known as the Mansard roof, sometimes called the French attic. The splendid architectural piles in Paris received some of their best graces of expression from the handsome sky-lines the Mansard roof gave them, and almost every American traveling abroad wondered why so graceful a roof could not be adopted in our American cities, where the largo buildings usually terminated with an abrupt, sharp, and unpictnresque sky-line. The Mansard roof after a time was introduced, and its peculiar beauty soon made it very popnlsr. But, like all fashions which become the rage, and which are adopted by people imitatively, without perception of the principle that governs them, the French attic has become with na an architectnral infliction. The Mansard roof was designed for tall buildings. Its special purpose is to break the monotony of a massive pile, and to rednce in appearance its real hight. A structure that would seem awkwardly tall, with an nnvaried succession of stories, has not only, by means of the Mansard roof, a more graceful caption, bnt attains more agreeable proportions. The specific purpose of this roof being recognized, the absurdity of its use in small buildings becomes at once apparent. Onr builders, however, seem to lack all power of perception, and to have redneed the art of architectnre to indiscriminste imitations. Everywhere now the Mansard roof confronts us. Every new cottage on the roadside, new cheap villas in those extemporized villages that line our metropolitan railways, new public buildings of every sort and degree, railroad station-houses all over the country—everything of the kind now, no matter if only a story high, must have its Mansard roof, with entire disregard of fitness or propriety. It is exasperating to see a good idea thus dragged into absurd and ignoble nses. As we at first hailed with pleaanre the appearance of the Mansard roof, we shall now look with hope for the signs that will indicate the termination of its career. And yet whatever may follow will have to undergo the same experience. It is our natural way to try and appropriate every big thing for every little purpose.—*American Builder.*

Protecting Varnish.—A simple invention for the preservation of cards, photographs, and, in fact, of anything likely to be injnred by moisture or dirt, has just been announced. It consists of a preparation of gutta-percha in solntion. This liquid is thrown in a very fine spray over the article to be protected, by an atomizer. By this process a thin film is prodnced, and when the liquid part has evaporated, as is very speedily done, the object is coated with a transincent substance, impervious to water. Gutta-percha, in its pure state, is of a semi-transparent grayish color. But its transparency, as a covering for pictures, depends on the thinness of the film. The gum first needs to be purified, and then, if it has not been treated with alchohol, it is soluble in chloroform or ether. The process of dissolving it is in itself a purifying one. The ether, being highly volatile, very soon disappears when the spray is deposited on any object. A drawing or photograph thus protected can be washed, the gum not being permeable by water, and resisting any amonnt of heat so long as it is wet. It begins to soften, however, at a temperatnre of 150° Fahrenheit. But this is a temperature to which our climate naturally snbjects nothing. This simple invention might come into very practical and general use; and if it did no more than to give additional security to the work of the camera, it would be a highly valuable invention.

Nitro-glycerine.—Nitro-glycerine is an explosive oil, in many respects analogous to guncotton. It is produced by the action of nitric acid, mixed with oil of vitriol, npon glycerine, the sweet substance obtained when oils and fat are steamed. It is one of the most treacherona explosive substances known to chemists, and frightful accidents have been caused by inadvertently nsing it in its crnde state. In the course of many endeavors to counteract or redince the sources of danger attending the use of nitro-glycerine, M. Nobel made the important observation that its explosive properties were not reduced; but, on the contrary, somewhat favored, by mixing the liquid with solid substances, in themselves thoroughly inert. This led to the production of dynamite, which constitutes one of the safest, most powerful, and most convenient explosive agents applicable to industrial purposes, although it is not, in our opinion, equally applicable to military purposes. Dynamite is made by mixing nitro-glycerine with a porous, infusorial earth, known in German as "Kiesselgnhr." The earth absorbs the oil, and the result is a plastic, putty-like substance of a brick-dust color, containing about 75 per cent. of nitro-glycerine and 25 of absorbent earth.—*Jour. of Chemistry.*

Air.—In air containing not more than 0.0006 of its volume of carbonic acid, the odor from presence of organic matter is imperceptible. Pure air contains a proportion of about 0.0005 of carbonic acid.

Fruit contains germs of decay, which must first be destroyed, otherwise the formation of a vacuum about them will not snffice to preserve the fruit.

A Natural Hygrometer.—An instrument for measuring the humidity of the atmosphere, and one which, combined with the thermometer and barometer, might be of great nse to farmers, in prognosticating the weather, may be made, according to M. H. De La Blanchere, as follows: The grain of the common oat of agriculture, and also of the wild oat, is surmounted by a barb, which is terminated by a right-angled elbow. Let one of these grains at maturity be cut in half, and the upper half be attached by means of glue to the center of a circle marked upon the plane surface of a piece of wood or metal. To the extremity of the barb may be attached a fine piece of straw which will serve as a needle, and will amplify the indications. To graduate this simple little instrument, place it in very hot air, and mark 0 at the point indicated by the needle; then place it in an atmosphere saturated with humidity by means of wet cloths, and mark the point indicated by the needle 100, and divide the interval between 0 and 100 into one hundred equal parts. The straw needle may be made of considerable length, so as to give its indications clearly. Such a hygrometer costs bnt little, and is always comparable with itself.

Incombustible Wood.—Several attempts have been made at different times to render timber nnlnflammable. A new and apparently successful method has recently been tested, of which, perhaps, the most convincing of the first series of experiments was that in which a large heap of the prepared timber, about two feet high and seven or eight feet in circumference, placed on large iron sheets, was saturated with paraffin and set on fire. As soon as the paraffin was consumed the fire spontaneously went ont. The timber was then examined, and found to be scarcely injured. The pieces of wood were of various sizes, the majority being about eighteen inches long by two and three inches square. Not only does the process render timber uninflammable, but it has the not less important property of making the softer kinds of timber (such as white and yellow pine) throughout, both in appearance and hardness, like teak or oak. What adds immensely to the valne of the discovery is that the system can be applied by a simple method to ships already built, so as to render those containing incipient dry-rot almost as good as new, and absolntely arresting any further damage from these destructive fungi.

Blisters in Veneering.—Cut out the blistered part with a very sharp, thin-edged cutting instrument, and glue it on again, after soaking the piece thoroughly in hot water, and then flattening it ont between two flat hard-wood surfaces brought together firmly by heavy pressure. Before gluing, its under side should be again moistened with hot water, and, after wiping off the water which stands on the surface, the glue, which should be hot and not be too thick, should be applied; then replace the piece, and hold it down firmly to place in the usual way till it is dry. The spot where the piece is to be replaced ought also to be sponged with hot water before applying the patch. If this be done carefully, the defect will be remedied; and the joining will only be seen on the closest inspection.—*Artisan.*

Testing Belting Leather.—M. Eitner proposes the following simple method of determining the value of leather employed on belting. A cutting of the material about 0.03 of an inch in thickness is placed in strong vinegar. If the leather has been thoroughly acted upon by the tanning, and is hence of good quality, it will remain, for months even, immersed without alteration, simply becoming a little darker in color. But, on the contrary, if not well impregnated by the tannin, the fibers will quickly swell, and, after a short period, become transformed into a gelatinous mass.

Cement for Glass and Porcelain.—Two parts of isinglass are soaked in water until well swollen; the water is then poured off, and isinglass is dissolved in alcohol by the aid of heat. One part of mastic is then dissolved in three parts of alcohol and added to the above solntion; then one part of gum ammoniacum. The solution is well shaken, and evaporated to the consistency of strong glue, when it solidifies on cooling. For use, the cement and the articles themselves must be warmed.

The *American Chemist* states that a waterproof paper, transparent and impervious to grease, is obtained by soaking good paper in an aqueous solution of shellac and borax. It resembles parchment paper in some respects; if the aqueous solntion is colored with aniline colors, very handsome paper, of use for artificial flowers, is prepared.

To Soften Skins.—Soak the skins in a mixture of two quarts bran and one gallon of water, for three days; take them ont and rub them with a handful of salt (if they have hair or wool on, add powdered alum with the salt) and hang up to dry. When done in this manner they become as soft as kid.—*Jour. of Chem.*

One-half to one per cent. of fusel oil may be detected in ordinary alcohol by introducing into it, in a long test tube, a few fragments of potassic iodide, agitating gently. If fusel oil is present, a light yellow coloration makes its appearance in a few minutes. Heating develops this color more rapidly.

Gas from Clay.—Rev. Henry Moule, after a series of experiments extending over 20 years, has devised a process of manufacturing an illuminating gas from clay found at Kimmeridge, England.

Good Health.

The Human Frame.

No. 6—The Larnyx.

The larnyx is one of the most delicate and beautiful organs of the body. It is, in fact, an admirably constructed musical instrument so placed as to utilize the currents of air, passing in and out of the lungs, for the production of sound. It is a piano, flute and clarionet all in one; and all compressed within the space of a cubical inch. The lungs are the bellows which supply the air; the trachea is the tube which concentrates and conducts it to the mnsic box, while the "vocal chords" supply the place of the numerous wires which cause the different tones to be produced in the piano. But, while there are dozens and dozens of these wires required in the piano, this tiny, but unrivaled instrument has but two, and these, like the eyes and ears, are perfect duplicates. Yet, these two "chords" of yellow elastic tissue are capable of producing a far greater variety of sounds than the boasted Chickering with its seven or eight octaves. True, the human voice, except in rare cases, does not exceed two or two and a-half octaves, but the instrument of art only has a single half tone between each note, while the voice in this respect is almost unlimited—Jenny Lind, it is said, being capable of producing one hundred appreciable tones between any two major intervals in the scale. Besides this, when we consider the endless variety of expression the voice is capable of, compared with the puny "stops" of other instruments, it becomes useless to draw comparisons further.

But perhaps it may be desired to know something more of the mechanism by means of which those wonderful results are accomplished. Well, this box, placed just below the base of the tongue, and the forepart of which constitutes the well-known Adam's apple, is triangular in form, with the apex pointing outward, and is constructed ont of nine "boards," or pieces of cartilage; these being bound together by eight muscles and about a dozen ligaments. Two of these cartilages have little horn-like terminations which project upwards into the cavity of this box, and at the ends of these are attached one extremity of each vocal chord, the other being attached on the opposite side. These cartilages are movable by means of muscles which cause them to partially rotate; thus putting the chords on the stretch or otherwise. These muscles are under the control of the will; and, just as the violin string gives a shriller sound when drawn tighter, so the owner has only to telegraph down, and these cartilages are "yanked" around in a twinkling, the vocal chords put upon extreme tension, and "Come out of that, John Henry!" is uttered with a shrillness that makes the little culprit fairly jump ont of his boots.

These chords are, as we have said, composed of elastic, yellow fibrous tissue, and covered by an extremely delicate mucous membrane, the thickening of which, by colds or otherwise, causes that huskiness of voice so often observed.

Another curiosity connected with the voice, is a "sounding box," hollowed ont of the frontal bones, known as the "frontal sinus," and which communicates with the fossa of the nose by means of tiny apertures. These often become also closed through the thickening of the mucous membrane from colds, etc., and hence occasion that peculiar, flat tone of voice known as "talking through the nose." When the cold passes away the aqueducts are reopened, resonance restored, and the nasal tone ceases.

The "Open Treatment" of Wounds.—The principal maxims followed by Prof. Rose in the treatment of wounds are to secure absolute rest after arrest of bleeding, and to provide for perfect freedom of discharge and scrupulous cleanliness. Another principle is to interfere with the healing process of wounds only when special indications are afforded, and to consider stitches and bandages of all kinds as interferences to be so avoided. The air to which the wounds are freely exposed in the open treatment must, of course, be pure, and the system accordingly includes the use of energetic ventilation. In the hospital, ventilation is obtained only by constant opening of the doors and windows, a proceeding which, it is true, renders the heating arrangements often insufficient in winter. The advantages claimed for this method are: There is no pressure or constriction by dressings. An irritation of the wounds by changing the position and external applications is avoided. There is no danger of infecting the wounds by impure articles. The danger of retention of matter is small. The state of the wounds may be controlled at any time by simply lifting the coverlets. As healing by the first intention is given up, as many ligatures may be applied as are desirable, and thus secondary hemorrhage may be better avoided. The air of the wards is not infected by emanations from the dressings, as in the case of other methods, except Lister's. There is less need for materials for dressings, therefore less expense.

An infusion of flaxseed, with licorice-root and lemon juice added, is recommended as a common drink in catarrh.

Taking Cold.

The secret of avoiding the unpleasant consequences thought to spring wholly from the action of cold upon the body has very little dependence upon exposure, but a great deal upon an impure and weak condition of all the vital processes. In other words, with an average or superior constitution, and an intelligent observance of all the laws of health, men and women could not take cold if they wanted to; they might be exposed to the action of cold to a degree equal to the beast of the field, and with like impunity. But in the case of persons with feeble constitutions, and who disregard knowingly or otherwise—and most frequently otherwise—the conditions of healthy existence, no degree of care will prevent the taking of cold, as it is termed. They may live in houses regulated with all the precision of a hot-house—they may cover themselves with the most highly protective clothing the market provides, and yet they will take cold. The consumptive person does not live, nor ever will live, even if kept in a temperature absolutely uniform, and clothed in a wholly faultless manner, in whom the well known signs of one cold after another will not be apparent. But, on the other hand, there are those who, like the late Sir Henry Holland, of good constitutions and living in accordance with the laws of health, may travel as he did from the tropics to the arctics again and again, clad only in an ordinary dress coat, and yet scarcely know what it is to have a cold, or sickness of any kind. The truth is, that in order to avoid taking cold from ordinary, or even extraordinary exposure, the vital processes of the body must be made strong enough to rise above the untoward influence of external conditions. If the body is not thus superior, if it is so weak that it can only act harmoniously under the most favorable conditions, a continued state of health is not among the possibilities. No more will a weak body maintain itself without harm amid great external disturbance than will the weak machinery of a steam vessel maintain itself without injury amid a severe storm. The avoidance of elemental disturbances are not possible in the one case any more than in the other, yet it is precisely what persons by the ten thousand are to-day seeking to accomplish in the preservation of their health. The study is not how to make their blood purer, their bodies stronger, but how to dodge the ugly weather.

The conclusion from all this is, that neglecting the conditions upon which strength of constitution and purity of blood depend, and then striving to avoid in a sedulously careful manner the evil influences of colds upon the body, is like neglecting the substance for the shadow of health; or more properly, it is like one who starves his body, and then strives to keep quiet in order that his strength shall not be exhausted. Let food be taken, and the exhaustion from exercise will not ensue; let all the conditions of health be observed, and then the natural changes of the weather will fall harmlessly on the healthy functions of the body.—*Sanitarian.*

Transfusion of Blood.—In many cases, particularly those in which exhaustion had taken place from hemorrhage, transfusion has been attended with remarkable success. In cases where organic disease previously existed, failures have been frequent. Dr. Flint states that while normally a patient should have from fourteen to eighteen pounds of blood in the system to properly sustain the functions of the body, the injection of from four to seven ounces of blood into the circulation of a person apparently dying has been known to completely restore the patient to life. The introduction of portions of blood without the red blood-globules has been unattended with good results. These blood-corpuscles are the oxygen carriers. It is Dr. Flint's opinion that this operation is perfectly practicable, and that it should not only be employed in those desperate cases where favorable results are scarcely expected, but should be resorted to before patients have fallen into such a desperate condition.

Legislation and Hygiene.—The various lessons given us by Nature as to the possibility of checking or preventing disease have culminated in the fact that the State uses its moral power and material resources toward preserving the health of its citizens. As to how far the State may thus exercise authority, there is a difference of opinion; but the neglect of a city government to provide proper sewerage and the course of a common drunkard, both tending to disturb the public peace and the comfort of individuals, are alike crimes and should be considered as such in law. The existence of vile deposits which overwhelm the inhabitants with a tainted atmosphere, or the spread of the habit which strikes at the root of the physical, moral and intellectual health of the people, are both producers of disease to the community, which should be as sedulously guarded against as the visitation of a fever to the individual, and the means used to defend the people from their ravages are striking examples of pure preventative medicine.—*Sc. Am.*

Prevention in Place of Cure.—President Barnard says that the advance of modern sciences is such that the physician will eventually find his occupation gone. The people would, as they advance further in knowledge of natural laws, become more and more able to dispense with the doctor, and in brief would learn so to apply the "ounce of prevention" as to obviate the necessity of the "pound cure."

Removal.

July 13th, 1874, the business office of this Journal was removed just one block east of our former location, to No. 224 Sansome Street, southeast corner of California, over the Bank of British Columbia, where we have secured large and elegant quarters. This removal is made in consequence of the sale of the building which we formerly occupied, to parties who will proceed immediately to demolish the present structure and erect a new and magnificent block in its place.

THE Seattle Coal and Transportation company, through their agent, Mr. Hewes, are rapidly getting things in shape for the resumption of coal mining and shipping. Last week Mr. Alexander went from Tacoma with 40 Chinamen, to build the new road, and a contract was given the Freeport company to furnish nearly 200,000 feet of lumber required in the work. Next month they will be selling in the San Francisco market.

MESSRS. SIMPSON BROS., of Coos Bay, have now on the stocks, and nearly ready for launching, a 2,000-ton ship, which they expect to complete by October next, when they will send her round to Portland to load with grain for Liverpool. She is said to be of handsome model, and in all respects a first-class vessel.

THE snow is rapidly disappearing from the more prominent peaks of the Sierras visible from the Comstock range, and but little is now to be seen on any of the peaks to the eastward about the Humboldt range.

THE ice at the Stockeen mines has all disappeared, but the miners have still to thaw off the top dirt. The miners expect Dease creek to pan out big as soon as the water goes down.

THE Virginia and Truckee railroad shipped 23,780 tons of ore from the Comstock lode during June.

THE petroleum business is rapidly developing into one of the most important industries of Los Angeles county.

THE Emperor Alexander is reported ill at St. Petersburg.

THE American quicksilver mine will soon have the new reduction works completed.

A Prosperous Mine.

What the Crown Point has Done During the Past Year.

The Crown Point mine, on the Comstock lode, has, through its immense bullion production, attained a world-wide reputation. During the past year it has maintained this enviable position, and seems likely to do so for many years to come. The work of opening up the mine ahead has been prosecuted with great vigor, and attended with the gratifying results of adding reserves equal, if not more, than were developed at the time of the last annual meeting, thus insuring equally satisfactory disbursements to stockholders for the incoming year. Prospecting is still being pushed forward with every confidence of adding largely to present developments. The 1,400 and 1,500-foot levels are now open, with the stations and drifts necessary to extract the ore; and with the improved facilities for operating the mine, that they have with the new hoisting works, there is every reason to anticipate success.

Developments This Year.

The annual report of this company contains some interesting figures concerning the expenses and profits of working a large and paying mine. The figures are made up to the first of May, 1874. At the date of the last general report of the Superintendent, the 1,300-foot level was the deepest ore-producing level in the mine, although the main incline was down to the 1,500-foot level, and the necessary preparations to cut out a station there were made. Since that time, the drift in the 1,400-foot level, south, along the foot wall, has been continued south to the Belcher line, and has been connected with the 1,300-foot level by three winzes, thus securing good ventilation, etc. The north winze, which is 252 feet due north of the Belcher line, shows a continuous ore body from the 1,300 to the 1,400-foot levels, with many rich spots and streaks; and, in some places, the ore is mixed with porphyry and barren quartz. Both the middle and south winzes showed ore of a superior character and quality for about 75 feet down, when they passed into the nearly barren material lying next to the east wall. No cross-cuts have been run on the 1,400-foot level. The north cross-cut developed two bodies of ore aggregating 42 feet in width, separated by a belt of porphyry, eight feet wide. The middle cross-cut also exposed two ore bodies; they show an aggregate width of 80 feet, and the intervening belt of porphyry is 85 feet wide. These cross-cuts are 158 feet apart, but the various vein peculiarities exposed in both present convincing evidence that the ore bodies are continuous, and that the last development in the middle cross-cut is identical with that in the north cross-cut. The fact that the porphyry which separates the two bodies has contracted in the north cross-cut to a belt only eight feet wide, would seem to strengthen the story of the Superintendent, in his last annual report, that the east and west chimneys would eventually unite and form one large and compact ore body.

On the 1,500 foot-level a commodious station has been cut out, 45 feet long, 14 feet wide and 9 feet high. A double drift 10x6 was started from this station, running south 73½ E. When 250 feet long and 345 feet due north of the Belcher line the west wall was struck, in passing through which exceedingly rich ore four feet in width was struck. The drift was further continued 38 feet in low grade quartz when rich ore was again struck and continued for 10 feet, when the wall was found and the drift discontinued. The last ore struck was worth from $100 to $250 per ton. This drift will soon be pushed ahead again to find the east ore body. The developments on the 1,500-foot level are very encouraging; and it is expected that in point of richness and extent it will be equal to any yet opened.

The East Ore Body.

The first discovery of the east ore body was made on the sill floor of the 1,200-foot level, at which point it was two hundred feet long. On the sill floor it was 25 feet long. On the sill floor of the 1,400-foot level it has not been traced to its northern extremity, but it has been shown to be more than 320 feet in length. When discovered it was supposed that it extended but a short distance above the sill floor of the 1,200-foot level, but since that time drifts on the 2d, 3d, 5th and 9th floors of that level have been run, and in each drift ore has been found worth from $50 to $80 per ton and averaging ten feet in width. The Superintendent thinks this ore body will extend up to the 1,100-foot level and perhaps higher. They have already found ore enough to enable the 1,200-foot level to hold out, at present rate of extraction, a year longer than it otherwise would.

During the last fiscal year a large amount of

Dead Work

Has been necessarily done. The stations on the 600, 700, 800 and 900-ft. levels have been retimbered, etc.; 300 feet of the main south drift of the 900-ft level have also been retimbered. On the 1,000, 1,100 and 1,200-ft levels they have in the aggregate retimbered 2,200 feet of drifts, and 400 feet of winzes and timber chutes. The timber chute from the 1,100 to the 1,200-ft level, 184 ft. long and 3½x5 ft., has been retimbered four times during the year. Extensive repairs have been made in the main shaft and incline, and a new compartment has been raised from the 1,000-ft level to the surface. This compartment adjoins the north hoisting compartment on the east, and is intended as a rope shaft for the new incline hoisting machinery.

Improvements at the Mine.

The following work has been done in prospecting, working and ventilating the mine: drifts run, 1,200 ft.; cross-cuts run, 500 ft.; raises made, 200 ft.; winzes sunk, 1,250 ft.; drifts retimbered, 2,500 ft. The following outside improvements were also made: two substantial wood elevators have been erected, by which one man can deliver all the wood required in running the entire machinery of the mine. A carpenter and machine shop, 36x100 ft. and two stories high, and a building 36x100 ft. with 19 ft. posts, for the incline machinery, have been erected. A 12x24 engine in the carpenter shop drives two circular saws.

Facilities for contending with fires have been increased. The main large reservoir of the mine has been connected with the mine by new and stronger pipe. The water company supplies plenty of water, and they have no longer to pump from the mine to keep this reservoir full. The works have been surrounded by hydrants, enabling them to attack a fire at any point.

The New Hoisting Machinery.

The building for the new machinery is very substantial. The foundation consists of brick and stone masonry 17 feet in depth, and contains sixteen 2¼ inch anchor bolts for the pillow blocks and 30 two-inch anchor bolts for the engines. The hoisting reel for this machinery is the largest on the coast, being 21 ft. 6 inches in diameter, with a face of 6 ft. 6 inches. The face has a spiral groove of sufficient capacity to wind a two-inch steel rope to work the mine to a depth of 3,000 feet. The reel is heavy and strong, and will hoist 12 tons of ore at a load. It is driven by a pair of 20x42 link-motion engines, so arranged as to run singly or together. The two engines are equal to 250 horse-power. The gear and pinion wheels are all duplicated, so that in case of accident there will be little delay in hoisting.

The following statement will show the economy and advantages of the new machinery over the old used on the same incline:

The old works hoisted two tons of ore at a load; the car and rope used to hoist the same (figuring from the 1,500-foot level), weigh 11,000 pounds. The car and rope of the new machinery will hoist 12 tons at the load, and weigh 18,100 pounds. Now, taking the hoisting of 500 tons of ore per day as a basis for calculation, the following result will be shown:

To hoist 500 tons of ore by the old works requires 250 trips of the car, which, at 11,000 pounds per trip, aggregate in dead weight	2,760,000 lbs.
To hoist 500 tons of ore the new works would have to make 41⅔ trips, which at 18,100 pounds per trip, aggregate in dead weight	764,166 lbs.
	1,995,844 lbs.

Showing that in hoisting 500 tons of ore the new machinery saves over the old the expense of hoisting 1,195,844 pounds.

To hoist 1,995,844 pounds from the 1,500-foot level requires 2¼ cords of wood at $12 per cord, amounting to $30 per day, and for the year to $10,950. The old works wear out six ropes per year, at $3,000 each, aggregating $18,000; one rope, costing $6,000, will last the new works two years. Here is a clear saving in ropes per year of $15,000, and in wood of $10,950.

In addition to the above, a great saving will be made in the more speedy transportation of men and materials to the various levels, and, what is of more importance, it will be attended with much less peril to human life. The cost of this machinery, including the freight and the expenses of setting it up, will be about $50,000.

Ore Extracted.

The amount of ore extracted during the fiscal year was as follows: from the 1,000-ft. level, 16,576 tons; from the 1,100-ft. level, 388 tons; from the 1,200-ft. level, 23,636 tons; from the 1,300-ft. level, 84,000 tons; from the 1,400-ft. level, 15,000 tons; total 139,600 tons. The actual amount of the ore reduced at the mills was 140,132 tons, yielding on the average $50.96 per ton. A large amount of ore remains in each of the above named levels, and as the above figures show, the 1,400-ft. level is almost intact, while from the 900 and 1,500-ft. levels no ore was extracted.

The company's mill has been kept constantly running since the last annual report. It has been supplied with an entirely new battery. A tank 110x36 for catching slimes has been placed within 50 feet of the mill. This tank is divided into 30 compartments. In concluding his report the Superintendent, S. L. Jones, says: "I desire to say the future of the mine never looked brighter than it does at present. It is true that a very large amount of ore has been extracted during the year, but at the same time the developments in the mine have been equally great, and in my judgment there is more ore in sight in the mine to-day than there was at the time of the last annual report."

The report of the Secretary, Charles E. Elliott, shows the financial affairs of the mine in detail from May 1st, 1873, to May 1st, 1874:

RECEIPTS.

Bullion	$7,417,115 30
Mine Expense	10,487 95
Rhode Island Mill	2,575 14
Interest	2,750 00
S. F. A. and R. Works	288 54
Cash	1,873,891 41
Total	$9,306,106 26

DISBURSEMENTS.

Mine Expense (Engineer, etc.)	$1,449,301 86
Mine Improvement	31,200 00
Rhode Island Mill	172,651 16
Rhode Island Mill Improvement	1,204 00
Crushing	1,488,019 34
Legal Expense	41,604 72
General Expense	26,940 88
San Francisco Expense	11,331 14
Taxes	86,097 49
Discount	112,811 69
Treasure Freight	30,917 38
Assaying	63,410 98
Assay Office	48 16
Interest	914 63
Dividends (Nos. 31 to 42 inclusive)	5,300,000 00
Cash	490,651 90
Total	$9,307,106 25

In the disbursements for "mine expense," $912,689.75 was expended for labor; $261,312.64 for lumber; $53,978 for wood; $50,496.65 for castings, machinery, etc.; for freight and supplies, $14,532.39; candles, oils, hardware, rope, etc., $146,292.43.

On the Rhode Island mill they paid for labor $45,658.87; for wood, $28,987.25; for machinery and castings, $23,003.42; water, $8,400; quicksilver, chemicals, oils, etc, $66,601.60.

Under "legal expense" they paid out $36,147.72 for adverse claims and titles, and the balance, $5,457, for lawyers' fees.

It cost $75,498.54 for the quarterly tax on ores; $109,857.57 for discount on bullion; $30,917 for freight on bullion; $10,978 for ore assays; $14,035.23 for bullion assays; and $38,397.70 for coinage and parting bars. Following is the

Ore Statement.

Tons.	Lbs.		Yield.
16,044	820	At Rhode Island Mill (Average per ton $53.)	$ 860,360 61
37,619	1,300	At Brunswick Mill (Average per ton, $50 79.)	1,910,658 61
26,333	....	At Mexican Mill (Average per ton, $51 89.)	1,366,587 69
26,479	1,740	At Morgan Mill (Average per ton, $60 23.)	1,280,062 08
12,333	300	At Petaluma Mill (Average per ton, $60 64.)	824,644 12
10,488	650	At Pioneer Mill (Average per ton, $49 78.)	622,079 50
7,490	050	At Atlas Mill (Average per ton, $51 54.)	386,122 08
375	1,100	At Hoosier State Mill (Average per ton, $66 70.)	26,048 09
1,713	900	At Devil's Gate Mill (Average per ton, $44 25.)	75,828 87
1,804	100	At Sapphire Mill (Average per ton, $46 90.)	84,636 60
449	350	At Sherman Mill (Average per ton, $36 22.)	15,853 21
140,129	110	Total	$7,141,736 46

There were 140,129 110-2000 tons of ore worked, yielding $7,151,736.46, making average yield per ton $50.96¼.

The Bullion Statement,

As per assay certificate, was as follows:

Value of Gold	$3,107,326 74
Value of Silver	4,018,336 32
Assay, Grains and Chips	17,634 97
Reclamation, Belcher S. M. Co.	275,000 00
Wrecked ores, ores lost, V. & T. R. R. Co.	378 84
	$7,419,274 87
Reclamation on Bars Computed at Standard Value	2,169 57
	$8,417,116 30

The weight of amalgam before melting was $3,363,375.30 ozs.; weight after melting, $3,393,894.41; this equals 69,478.89 ounces, or a loss, say, of 2 1-20 per cent. The weight of bullion after melting was 329,389,641 ozs. Troy, or equal to 112 80-2000 tons; average value per oz., $2.16.

The average cost of working 140,129 tons of ore was $11.85 per ton.

Total cost of mining 140,937 110-2000 tons of ore, including all cost of running drifts, repairs to shaft and machinery, pumping, etc., was $9.24 per ton.

The assets and liabilities of the mine are as follows:

ASSETS.

Cash on hand May 1, 1874	$430,661 90
Mine Improvements, Buildings, etc	130,000 00
Rhode Island Mill	80,000 00
Real Estate	15,000 00

HEAVY BOOM CUT.—One night last week the boom at the mouth of Markleville creek broke loose, or was maliciously cut, and stampeded about 80,000 cords of wood. The *Alpine Chronicle* says that the sudden release of this immense body of wood, extending miles up the East Carson river, brought the several jams together with irresistible force, and a tidal wave of wood swept down into the main Carson river, and passed on through Carson valley, in its course strewing either bank with thousands of cords, piled up from ten to fifty feet high. On the East Carson the wood was forced upon the banks, piling it upon the toll road a depth of from twelve to twenty-five feet, large quantities lodging on bluffs forty feet high.

A DITCH, 16½ miles long, is being constructed by the Milton company, to convey water to Moore's Flat, Nevada county. It is to be seven feet wide on top, four at bottom and three and a half feet deep, and is intended to carry 2,500 inches of water.

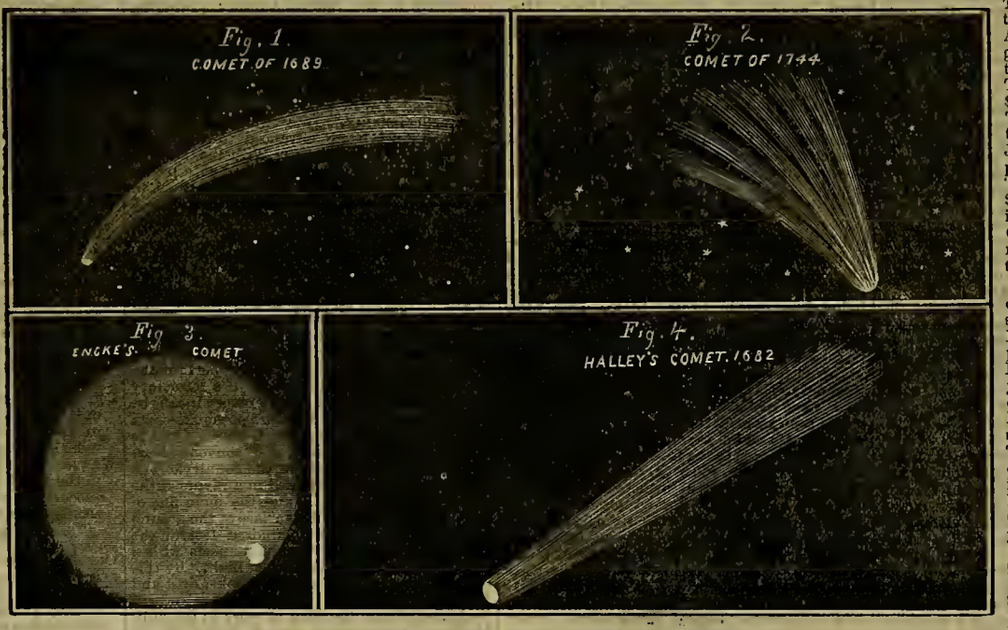
THE Phœnix mine, Calistoga, shipped 21 flasks of quicksilver last week.

More About Comets.

We gave a short chapter on comets last week, and so much interest appears to be taken in this class of heaveoly bodies just at this time, that we have been persuaded to add another chapter to-day, which we premise by calling attention to the accompanying engraving, that presents a vivid illustration of the four chief characteristic appearances which heavenly bodies of this class present to the vision. Fig. 1 represents the comet of 1689, which presented a curvilinear-shaped tail like that which accompanied the famous comet of 1858. Fig. 2 represents the somewhat unusual appearance of a double or many tails. Fig. 4 represents one, whose tail, either from its particular position with reference to the observer appears straight like a shadow, or which really is so. Fig. 3 represents the only instance we have had of a comet without any appearance of a caudal appendage, even at its nearest approach to the sun. Fig. 5 represents a portion of the ordinary orbit of a comet which it will be seen is extremely elliptical.

Notwithstanding all that has been written and said about comets, we really know but very little about them; but nearly all people, scientific men especially, are very anxious to know more. Philosophers have talked wisely, but generally very vaguely about them, and have expressed opinions in some respects quite at variance. Sometimes we are told that they are composed of such flimsy stuff, that were one condensed into a solid body, it might be readily carried in an ordinary pocket—that they are simply visible nothings! Of course such talk is arrant nonsense; because the value or weight of the mass of many comets has been approximately calculated, which have been ascertained to be bodies of large gravitating power, and in some cases the nucleus is known to consist of a dense opaque mass.

The nucleus of the comet now in the heavens is evidently a comparatively solid mass. This is known by the intense brilliancy which it presents when examined through a telescope. We have repeatedly made such examination since its appearance, with a small, but very superior instrument, having a 3-inch object glass, and find that the brightness of the nucleus is rapidly increasing as the comet approaches the sun. At this time its brilliancy is far superior to any star, and can be compared to nothing but the sun itself. But whether viewed as ephemeral or substantial bodies, comets present a most interesting subject of study and speculation.



What We Know About Comets.

We know positively that they differ widely from planets in their lesser density and very eccentric orbits. Planets all revolve around the sun in one direction, and in very nearly the same plane; while comets move in every possible direction and at every possible inclination from any given plane. The paths of comets are either an ellipse, a parabola, or a hyperbola; in the latter case they come into the solar system from one direction and go off in another, and in such tracks that it is impossible that they can ever come back to us when they have once left. They are simply wanderers in space, without any fixed track. Some comets have revolutions as short as three years; one, that of 1811, is estimated to have a revolution stretching through a period of not less than 3,000 years! Planets have a uniform speed, while the speed of comets varies according as they recede from or approach the sun. When near their aphelion or greatest distance from the sun their movements is exceedingly slow; when at their perihelion or nearest the sun they move with almost incredible velocity, even for heavenly bodies. It was calculated that the comet of 1843, when nearest the sun, moved at the velocity of 22,000 miles a minute, while the earth moves only about 1,100 miles a minute.

What We Don't Know about Them—Chances of Collision with the Earth.

It is estimated that there must be at least a million of comets, and probably several millions, which revolve our solar system; but of all this vast number not over 1,500 ever come within the earth's orbit, and of course the chances of collision are restricted to this small number only. And when we reflect that only 150 visit us in a century, and that they come in upon us from each an infinite diversity of directions, we must become aware that the chance of collision are so infinitely small that the mind can scarcely comprehend the fraction of danger. It is safe to say that the chances of any given individual being killed by lightning, even here in California, are as many hundreds of millions to one of the probability of danger of injury from any collision of the earth with a comet. Moreover, it is very definitely known that much of the largest portion of those which do reach the earth's orbit are of such extremely gaseous consistency, that even were they to come in contact with the earth they could no more penetrate the atmosphere, so as to reach anything upon the earth's surface, than could a dry sponge, if thrown upon the surface of the water, reach and crash a lobster or other slow crawling object which might at the moment be upon the earth at the bottom of that water.

Again, there is only one comet known whose orbit crosses the earth's plane at any point in the earth's orbit; and the only chance of collision is that both should reach the same point at the same time. The chances of a collision even with *that* body are enormously large against such an occurrence. The chances of collision with any other known comet are about as great as would be the chances of a street car on Montgomery street, in this city, colliding with another on Broadway, New York. The idea that comets are dangerous visitors to our system has its only support from superstition and nervousness, and not from reason or science.

The lack of danger from the approach of a comet near a planet was remarkably illustrated by the approach of Lexell's comet to the planet Jupiter in 1779. That comet evidently became entangled with Jupiter's moons, or came so completely within the influence of the attraction of that planet, as to be entirely held from its course for several months, and yet not the slightest disturbance could be observed in the equanimity of even the smallest of those satellites.

Comets' Tails.

We endeavored last week to illustrate the philosophy of the tails or trains of comets, showing that they, in all probability, consisted simply of reflected light, nothing more. There are various and diverse phenomena accompanying these appendages, for which it is difficult to account upon this or any other theory. This is especially the case with regard to the comet of 1744, shown in our illustration with six different tails. Why they are thus divided up or spread out into such a fan-shape is a puzzle for scientists. We are told that our present visitor is giving symptoms of a development of two tails.

The gradual development and disappearance of the tail of a comet is shown in the illustration of the orbit of a comet, fig. 5. When first seen by a powerful telescope a comet presents a round, nebulous mass like that shown in fig. 3. As they approach the sun the tail is gradually developed, as shown by the approaching comet, in fig. 5, and disappears in the same way as is seen by the same body on its retrocession, as indicated by the arrow in same figure.

Another peculiarity is the remarkable deflection or curvature of the tail, which is often presented, and which deflection, when seen, is greater when the comet is near the sun. The tail when near the sun is sometimes seen much more deflected than herewith shown. Cases have occurred where the tail was almost at right angles with a line passing from the center of the sun through the center of the comet. This incline is greatest when the comet is approaching the sun, as shown in fig. 5, and is always toward that region of space from which the comet is moving. In some comets either this deflection does not exist, or the tail is so presented to our vision that it is not perceptible. That such may be the case can be illustrated by holding up to the vision, some considerable distance from the eye, a curved stick. When held in the proper position the curve is distinctly seen; but when turned one-quarter round, the stick appears perfectly straight.

The tails of comets vary immensely in length—that of 1680 was not less than ninety-six millions of miles in length—a length representing the entire distance of the earth from the sun. The free movements of these immense streamers through space, and the fact that though many millions of miles in thickness, the faintest stars may be seen through them, afford abundant evidence that whatever may be their nature, they do not consist of matter of any kind. Hence, no sensible effect can be produced by their contact with the earth, or from the earth being actually immersed in them, unless it be an excess of light for the time. From the enormous expanse in space which they occupy or sweep through, it is by no means an improbability that these appendages may often come in contact with our orb. Indeed there are at least one or two instances in which there is but little doubt that the earth actually passed through a comet's tail, and without any perceptible effect whatever. Among the most singular phenomena connected with comets' tails is the remarkable trembling or pulsating motion often observable in them—something like the wave motions sometimes observed in the aurora. These pulsations seem to start from the nucleus, and run slowly along the whole length of the tail.

Distance of the Present Comet from the Sun and Earth.

According to the observations of Prof. Parkhurst, who is making the present comet a special study, that body reached its nearest point to the sun—its perihelion—on Wednesday of last week, and will make its nearest approach to the earth on Monday next, July 20th, when it will be 25,000,000 of miles distant. This distance is about 3,000,000 of miles less than that of Venus when that planet is at its nearest approach to us. Twenty-five millions of miles is quite a respectable distance, and little danger need be apprehended as our celestial visitor thus flits past us on flight to the regions of space beyond our solar system.

Timorous and superstitious people are an unhappy race of mortals under any circumstances, and the appearance of comets and all other unusual natural phenomena, are well calculated to sorely plague them; but it is to be hoped that such important discoveries may be made during the continuance of the present comet within our vision, that the old superstitions notions which still linger in the minds of many, may be entirely done away with.

Reported Attempt at Compromise in Cuba.

It is stated that two gentlemen from Venezuela arrived in New York, who have a commission from the President *pro tem.* of Cuba, to treat with Captain-General Concha about a compromise between the Cubans and Spaniards. They have already had several interviews with Concha, and have seen General Alent, of Cuba, in New York.

Mining Dividends.

The dividends from mining companies on the Stock Board for the half year ending June 30th, foot up in the aggregate the sum of $86,049,600. The following table shows the dividends paid by mining companies during the first six months of this and last year.

	1873.	1874.
Belcher Mining Company	$3,432,000	$3,120,000
Black Bear Quartz	15,000	51,000
Cederberg Mining Company	24,000	.....
Consolidated Amador Mining Co.	120,000	30,000
Consolidated Virginia Mining Co.	.....	648,000
Crown Point Mining Company	3,100,000	2,000,000
Eureka Mining Company	180,000	.....
Eureka Consolidated Mining Co.	50,000	100,000
Keystone Quartz Mining Co.	.....	5,000
K. K. Consolidated Mining Co.	12,500	.....
Lyon Mill and Mining Company.	.....	20,000
La Grange Ditch Mining Co.	12,500	.....
Meadow Valley Mining Company.	120,000	.....
Monitor Belmont Mining Co.	50,000	.....
Raymond & Ely Mining Company.	300,000	.....
Redington Quicksilver M. Co.	.....	75,600
Total	$7,416,000	$6,049,600

The sum total does not amount to so much as that disbursed in the first half of 1873, but it is nevertheless, very respectable. For the first half of 1872, the amount was $4,026,300. The Belcher has paid $5 per share each month this year. The Black Bear has paid two of 25c each and four of 30c each. The Consolidated Amador paid two of 50c each in March and April. The Consolidated Virginia paid $3 in May and June the first paid by that claim. The Crown Point paid four of $3 each and two of $4 each. The Eureka Consolidated paid two of $1 each in May and June. The Keystone Quartz paid one of 50c in February. The first quarterly dividend of $1 was paid by the Lyon mill in April. The Redington Quicksilver has paid $10 per month since the beginning of the year.

Last year the Black Diamond coal company paid in the first six months, $25,000, and the Eastport Coos Bay coal company paid $10,000. The Black Diamond company paid this year, dividends of one-half of one per cent. in February, March, May and June, but none in January or April. The Eastport Coos Bay coal company paid one per cent. in January and February, but has paid nothing since. The Cederberg paid $24,000 last year; the Raymond & Ely, $300,000; the Eureka, $180,000; the K K Consolidated, $12,500; the La Grange Ditch, $12,500; the Meadow Valley, $120,000 and the Monitor-Belmont, $50,000, yet none of these have paid anything this year. The large dividends of Belcher, Crown Point and Consolidated Virginia have brought the aggregate up pretty high.

It must be recollected when summing up these dividends that they are only from mines which are listed on our Stock Board. There are thousands of other mines paying dividends of which little or nothing finds its way into the newspapers. When mines are either worked by a small company or a few men jointly, and the profits divided among them, they are never called on the Stock Board, and are consequently seldom heard of. The owners of such mines are reticent in giving any information on the subject of dividends, so the figures do not go to swell the amount disbursed by dividend paying mines.

Virginia City and Gold Hill are fast becoming one town, so rapidly are buildings being erected. The gap on the divide, separating the two places, is fast closing. Heretofore, for some years, there has been a sort of straggling row of houses between the suburbs of Virginia and Gold Hill. Now, not only are the spaces along this straggling street filling up, but the suburbs themselves of the two towns are beginning to meet.

The Weber River Coal Beds.—We give in another column an interesting article from our Salt Lake correspondent on the coal beds of Weber river. It treats upon a section of country which has not been written up before, though it possesses merits that should have long before this been brought to the public notice, especially as it is the section from which Salt Lake city and Ogden derive their main supplies of coal for domestic use.

A rich strike has been made in the Seven-Thirty mine, at Deadman's Flat, below Grass Valley, owned by E. P. Sanford & Co. A candle box filled with rock was taken out the other day, and it is estimated the specimens are worth over a thousand dollars.

Some parties who were taking out ore from the Pioche mine on shares had 23 tons crushed at the Floral mill, which yielded the handsome sum of $5,300, being 81 per cent. of the assay value. Some of the bars range up to 920 fine.

Dr. Mucer, of La Porte, last week picked up a hundred dollars' worth of nuggets in his diggings at Gibsonville, Sierra county.

Typographical Errors.

[From the Pacific Rural Press.]

The proof-reader has the floor. It is so seldom that this much abused individual has an opportunity to speak for himself, that he may perhaps be forgiven if for once he becomes garrulous, and even a little spiteful. Any one who is acquainted with newspaper work understands the peculiar and not over comfortable position occupied by the proof-reader, but for the benefit of the uninitiated the situation is briefly reviewed. To describe it geometrically, a square may be imagined, in the center of which stands the proof-reader; at each corner are his natural enemies, the writers, the printers, the great reading public, and last and worst of all—himself. A crossfire is usually considered a very bad thing to get into; but when the cross is doubled, so to speak, it becomes more than human nature can well bear. The writers agonize if a word or a comma of their precious manuscript be altered; the compositors also row if "copy" is changed; the great public wonder how that stupid wretch of a proof-reader got things so mixed; and his own conscience troubles him because he has not been more relentless, even at the risk of offending the first two classes of critics. He stands alone, in that center of never ceasing fire. Truly it needs a martyr's courage, or a stoic's indifference, to maintain a calm front. But then, if he is thus assailed, he also has just grounds of complaint against at least two orders of foes. The writers perversely say what they evidently don't mean, or say what they do mean in a language that might as well be Syriac, or do their worst in covering errors of sense and of grammar under illegible chirography. And the printers are not much better. Time is money to them, if to any; and the first interpretation to the ofttimes cabalistic hieroglyphics they are called upon to "set" is accepted and acted on, regardless of the frenzy of the horror-stricken author, or the bewilderment of the long-suffering reader.

But as the contributors are generally the least merciful, our proof-reader proceeds to accuse them first. The most direct mode of conviction is to give a few instances of the manner in which they perplex and overwhelm both printer and proof-reader by carelessness in construction of sentences, etc., which have required only a moment's time, perhaps, to put upon paper; but which call for careful study or lucky guess-work, occupying much time, before they become intelligible to the reader. Such slips are most frequently owing merely to a want of care, but sometimes, and not seldom, are due to a perverse contempt for the simplest rules of speech. To begin at home:

An attaché of this office, whose manuscript unfortunately came to our proof-reader's notice, in a single article was guilty of the following: "Hats are manufactured in a dozen establishments, not more than three, however, being of any size. . . . . Two powder factories, or rather, we should say, explosive factories." Pretty rough on the hats and the powder factories, that. It is hardly necessary to specify which particular section of the ould country this editor hails from.

In the PRESS office all of the editors would not be absolutely certain of carrying off prizes for penmanship; but so long as there is English at the bottom of the obscure pothooks and hangers, there is always a fair chance of getting at it, and nobody complains.

Occasionally, however, there is a muss; as when, for instance, a correspondent, in writing of the wonderful restoration of Chicago since the fire, grows classical and speaks of "*Neptune* rising from the ashes;" or when a reporting committee-man deliberately says: "Visiting members were invited to take seats on *the floor!*"

On the whole, it isn't a bad idea, after all, to write moderately plainly. This conclusion is reached on recalling a sentence of one of our Grange friends, which should have read: "We are not taking the rag-tag and bob-tails of creation into our Order," and which was so penned that the compositor was really justified in calling a *t* a *w*, and sending in a proof-sheet with: "We are *now* taking the rag-tag and bob-tails of creation into our Order!" a piece of news which would certainly have astonished the Grangers at large, as well as the particular correspondent.

We noticed in *Moore's Rural New-Yorker* an account of the noble conduct of a Newfoundland dog, which bravely plunged, to rescue a drowning person, "from a bluff fully *fifteen* feet out of the water." It would be hard to say whether the compositor was to blame for his evident conservatism in the matter of figures, for probably the "copy" was here only a conundrum.

Punctuation is a matter for which the compositor and proof-reader are responsible; yet, in some cases, the fault, if there be one, should be attributed to the writer. The importance of correct punctuation was strongly illustrated, recently, at a meeting of the Ways and Means Committee, when it was shown that a comma in one place was worth $2,000,000. In the tariff bill which went into effect Aug. 1, 1872, the free list was extended by the addition of several hundred articles. Among the number added were "fruit plants, tropical and semi-tropical," for the purpose of propagation and cultivation. In engrossing the bill, or in the process of copying it for official printing, a comma was inserted after "fruit," and all fruit was thereby placed upon the free list. The custom officers, however, not noticing the change, continued to collect duties on fruit until the error was discovered. The Ways and Means Committee reported a bill to remove the comma, in accordance with the intent of the law of 1872. The amount of tax illegally collected is not far from $2,000,000.

The comma, like the tongue, is a little thing, and like it will make good sense or nonsense, just according as it is used. Take, for instance, the old nursery rhyme. With the commas misplaced, it is so nonsensical that it needs a commentary to explain it:

> Every lady in the land
> Has twenty nails on each hand,
> Five and twenty on hands and feet;
> This is true without deceit.

Alter the position of the commas and the meaning is clear:

> Every lady in the land
> Has twenty nails, on each hand
> Five, and twenty on hands and feet;
> This is true without deceit.

The omission of a comma has frequently given a very awkward turn to a sentence. We remember an epitaph which suffered severely from such an oversight. It ran pretty much as follows: "Erected to the memory of John Phillips, accidentally shot as a mark of affection by his brother."

A printer meddling with the verdict of a Coroner's jury, struck out a comma after the word "apoplexy," making it read thus: "Deceased came to his death by excessive drinking, producing apoplexy in the minds of the jury."

A correspondent introduces a piece of poetry to the editor of an American newspaper in these words: "The following lines were written fifty years ago by one who has for many years slept in his grave merely for his amusement. A comma at "grave" would have rendered the sentence, at all events, comprehensible, though nothing would efface its absurd diction.

Mineral Wealth.

Little, practically, is yet known of the inexhaustible mineral wealth that lies undisturbed along the entire belt of the foot-hills, which will yet be developed whenever capital can be induced to remain in the State. Iron, coal, copper and gold in rock, in places, can be found in large quantities in most of the foot-hill counties. We have seen prospects in quartz found in this vicinity, from well-defined ledges, which if found in Nevada or Amador counties, would soon have mills erected, and large fortunes would soon be made. The same may be said of copper. One mine near Michigan bar, in this county, belonging to the Cosumnes Copper Mining Co., of which John M. Carroll, of Sacramento, is the principal owner, has paid well and been continuously worked for three years, and a new furnace has recently been erected whereby the copper will be run into bars. This will double the profit to the owners, and is believed to be the first time that copper has been made into bars in California. We only cite this mine to show what energy, combined with well directed capital, can achieve. There are numerous mines just as good as this one, in Amador, El Dorado and Placer counties. All that is required to develop them is money and energy. The same may be said of iron. Numerous mines exist that run as high as 50 per cent., but like the other mines, they are too near home for any display of home energy or capital. If such mines are found in Nevada or Utah, they are at once worked, taken up, their advantages made known, and are sold to Eastern or foreign companies. California needs an infusion of Eastern energy; but we suppose we will have to wait for both that energy and capital until a return to specie payments takes place. Very few can now be induced to invest, either to open a mine or erect a mill, under the present financial system of this State. All we can do is to patiently wait for the coming good time.—*Folsom Telegraph.*

PILGRIM BAR MINES.—For the past four or five years Pilgrim bar, eleven miles west of Deer Lodge, has been the most productive placer of its area in Montana. During '70-'71-'72 its product was probably not much less than $1,000,000, and it may have been more. But the old bar is pretty thoroughly worked out; even the town site of Pike's Peak, where its busy workers lived, is buried under 20 feet of tailings, and the rich places that knew the toilers for gold will know them no more forever. But although the old bar is exhausted, the gold-bearing channel is not, and the indications are that more gold will yet be taken out of it than has been heretofore. As the lower mines worked out, Rogers, Broaddus, Irvine, Batterton, and others opened ground further up the bar with equally good results, and this spring the principal work is being done three-fourths of a mile south of and several hundred feet higher than Pilgrim bar, and the product is exceeding the most sanguine expectations of the owners. The present location is known as Granite bar, the back-bone separating Pike's Peak and Squaw gulches. There are four companies now working with hydraulice and Little Giants on the two sides of this bar, using 1,200 inches of water, with from 150 to 315 feet pressure, and employing 34 men.—*New Northwest.*

ASPHALTE PAVING.—Among the many new pavements patented and proposed is one which is made by embedding strips or blocks of wood in the asphalte; the two substances wear away at different rates, and thus depressions or channels and corresponding ridges are left in the roadway, forming good foothold for horses, which is the object of the invention.

Smelting Outlook at White Pine.

Matters here at Hamilton seem to assume a cheerful aspect just now, and great confidence is being expressed in the ultimate future of our base metal mines. Operations looking toward the speedy and successful reduction of ores are being commenced, and anguries for success are significant of the future we have so often and so earnestly predicted. The plans contemplated, as nearly as we have been able thus far to learn, are being rapidly perfected, and we can shortly expect to see smoke issuing from the smoke-stacks of the old Mattison furnaces, so long a monument to the misdirected efforts of the well-meaning but ignorant ore smelters. Mr. Prescott proposes to reline and repair one of the furnaces now standing, and arrangements have been made for the necessary coal and other material to start at once. The present run is intended as an experimental trip to guide future operations, no reasonable doubt being entertained of ultimate success. We are more than pleased to notice the evident desire on the part of our people to aid and assist in every way the work now being inaugurated, and judge that the efforts of the projector will be richly recompensed by golden reward. It is only a question of time when our district will again rank, as she should, among the best and most productive in the State. Another gratifying circumstance presents itself to us, which is, that no failure need be feared from incapacity on the part of the gentleman having the actual work in charge, his reputation as a successful smelter having been established in Eureka beyond the shadow of a doubt, and, united with his practical ability, we are informed that sufficient capital is being advanced to carry the work through successfully. With the assured fact that our ores can be smelted at a profit, then demonstrate that sufficient quantities to run furnaces can be obtained, and no difficulty will be experienced in inducing capital to assist in developing our mining interests.

HOLT'S MILL, at Golconda, has been lying idle for the past ten days, undergoing repairs. It will be started up again in a few days. Mr. Holt has just completed a new roasting and chloridising furnace, to be used in connection with the mill. This will prove a very convenient arrangement, as the greater part of the ore obtained in that district is of a refractory nature and requires roasting before it can be worked successfully. The flue or smoke-stack of the new furnace is quite a novelty, and is the most ingenious, safe, and convenient arrangement of the kind in the country. The mill and furnace are situated in a ravine at the foot of a very steep hill, and the main flue of the furnace is built on the surface of the ground for a distance of several hundred feet up the side of the mountain, where it connects with a sheet-iron stack about 40 feet high. By this ingenious contrivance all the smoke, dust and poisonous fumes are carried far above and entirely away from the men at work in the mill. Holt is of the opinion that it would not be worth while to patent this invention, as it might not always be convenient to build furnaces at the foot of a steep mountain.—*Humboldt Register.*

BOTTLES.—An original genius thinks his fortune is made, now that he has patented the plan of having bottles made rough in the interior surface, to which all crust and sediment would adhere, to prevent the rise and fall of crust and sediment in the bottle, whilst it is being changed from its position, and also whilst the liquid is being poured out from the bottle.

FOR some time past, parties have been prospecting for gold and silver-bearing leads on the Chehalis river, Washington Territory, from near James Smith's up to Lincoln creek on the latter, and the other creeks further south. Rock from Lincoln creek has been brought in and tested, and found to contain more or less silver.

NEW SHAFT.—We understand that the Sheba mining company, in Star district, have commenced sinking a shaft for the purpose of working the mine to better advantage. It is the intention of the company to erect hoisting works over the new shaft. The mine is looking well, and is yielding large quantities of rich ore.

A LARGE FORCE.—The Belcher mining company employ in their mine and on the surface, including those engaged in sinking the new air shaft, 1,000 workmen. They also consume three and a half tons of ice in rendering water fit for drinking purposes in the lower levels of the mine.

THE Buckeye mine, at Sawpit flat, Plumne county, was last week sold to Mr. Breed, of New York, for $50,000.

MACHINERY for the first mill in the Panamint mining district, Inyo county, is now en route.

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & CO.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

H. W. RUCKER, M. D.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

19v28-3m

The Steam Tug "Fearless."

The steam tug "Fearless," recently constructed for Capt. A. M. Simpson hy the Pacific Iron Works, of this city, has proved quite a success. Her hull is 100 feet long, 29 feet 6 inches beam, with 8 feet depth of hold. She is fitted with compound engines, substantially the same as those put into the new steamers of the Pacific Mail Co. The engines were designed hy Mr. Geo. W. Fogg, superintendent of the Pacific Iron Works. They consist of one 18-inch high pressure and one 29-inch low pressure cylinder, 18-inch stroke, with surface condenser, air pumps, circulating pumps, etc., and are so arranged that they can he run together as high and low pressure, or both high pressure. In case of accident they can be disconnected, and either cylinder run independently of the other.

The "Fearless" is designed for use in Coos bay, and it is said will tow the largest class of vessels at a speed of eight miles per hour. She was designed only for towing and has a tow instead of a speed wheel; yet the builders inform us that on a recent trial trip of some 100 miles, she made an average of 14 miles an hour without crowding, and with a consumption of less than 300 pounds of soft coal per hour. This seems rather extraordinary, considering the size and build of the vessel, for steam tugs of such dimensions seldom attain any such speed. Moreover, they are usually built more with regard to strength and towing capacity, than for fine lines and high speed. The builders also assure us that the cost of running the steamer is nearly 50 per cent. less than that of any other boat on the coast of equal size and power, proving at least that we can build steamers quite equal to those built in the Eastern States, machinery, hull and all. We are told that the performance of this little craft on her trial is regarded hy nautical men as very extraordinary, a fact not to he wondered at, while her towing large vessels at eight miles an hour is still more surprising.

SEVERE AFFLICTION.—Our long time agent in this city, and carrier of both the RURAL and SCIENTIFIC PRESS, Mr. A. C. KNOX, has been suddenly struck down by a disease which, for the present, at least, must render him utterly incapable of transacting any business. In fact, he has been unable to make to us a complete report of how his business as a carrier stands; hence subscribers in this city must hear with us, should any irregularity occur in the delivery of their papers, or their accounts. Mr. Knox has been connected with us, in one capacity and another, for some eight or nine years, and has ever proven himself a most faithful and honest agent. We trust that he may ere long be once more restored to full health and reason, and long continue to enjoy the society of his now afflicted family and many friends.

THE Gunboat ledge, owned by the Bayley brothers and N. H. Gray, is situated near Pocohontas, Baker county, Oregon. One day last week they cleaned up their sluice-boxes, after a run of five days, and crushing two tons of rock in their arrastra, and had $302 as the result. This is $151 to the ton.

REPORTS are current of new gold discoveries in Northern Arizona. A large number of new gold lodes have already been located, in all of which fine gold is discerned. The ledges are broad on the surface.

IT is reported that valuable gold mines have been discovered on the headquarters of Briggs creek, Josephine county, Oregon. Some miners, who went there last fall, have found several nuggets, valued at $90 each.

A PROSPECTING party returned to Boise City from Smoky creek country a few days since, bringing encouraging reports concerning rich discoveries.

THE Deering quicksilver mine, near the Reed mine, in the vicinity of Knoxville, was bonded last week hy the Deering brothers to Parrott & Co., of San Francisco, for $25,000.

DR. BAKER'S quicksilver mine at Soda Springs, near Lower Lake, was bonded last week to T. Parrott, of San Francisco, for the sum of $40,000.

THE Belcher mining company employ in their mine and on the surface, including those engaged in sinking the new air shaft, 1,000 men.

A THREE hundred pound boulder discovered last Friday in Henry Hays' claim, at Moore's flat, Nevada county, yielded about $2,500 worth of gold.

A PARTY left Olympia on the 6th inst. to explore the Upper Skagit river region in search of gold.

THE Great Western quicksilver mine, Lake county, expects to produce from 600 to 800 flasks a month hereafter, with a new furnace just completed.

JOSEPH WARNLOW, a pioneer miner of Siskiyou county, was found dead in his cabin near Hawkinsville, July 3d.

THE Lincoln ditch, in Amador county, is completed. It is 17 miles long.

SAN FRANCISCO prospectors have discovered a promising cinnabar deposit in Rockland district, Del Norte county. Quicksilver seems to be very generally distributed all over California.

THE Clear Creek ditch, in Shasta county, is said to have been purchased by Messrs. Hall, Taylor and others, and the property will be put in first-class order.

STEAM hoisting works will he put up on the new shaft of the Prussian Hill mine, Railroad Flat, Calaveras county.

THE Sohome coal mine, in Washington Territory, shipped to San Francisco last year 21,211 tons of coal, against 4,100 tons the year before.

THE Stockton tannery on Thursday shipped eleven tons of leather, for Germany and Yokahama, to San Francisco.

SINCE January last 65,000 bars of bullion have been shipped on teams from Cartago, Inyo county.

SEVEN teams with machinery for the Panamint mines left Los Angeles on Friday. Three more are to follow.

THE BLACK HILLS.—A number of Washoe miners and prospectors are talking about an expedition to the Black Hill region.

THE Knox & Boyle mine, Tuolumne county, shipped over $10,000 in bullion, during April and May.

THE Santa Cruz narrow-gauge railroad has purchased its first locomotive.

THE Rocky Bar, Oregon, mines are paying well.

THE Saratoga paper mill has shut down for repairs.

NEW machinery is to he purchased for another mill for the Black Bear Quartz Company.

THE Auburn Gold Mining Company's property has been sold by the Sheriff.

WORK is progressing steadily at "29 Palms," district, San Bernardino county.

SIX flasks of quicksilver came down on Saturday from the Missouri mine, Sonoma county.

SILVER CITY, Nevada, has a Piute boot-black.

General News Items.

TROUBLES AT THE EAST.—With hydrophobia, grasshopper plagues, hurricanes, lightning, floods, sunstrokes, hail-storms, and other dispensations too numerous to mention, the people of the Eastern States find themselves in the midst of more tribulations than they feel able to bear. Hail-stones fell in the northern part of New Jersey on the evening of the Fourth, some of which were two and a half inches in diameter; and still the Eastern people profess to sympathize with us for having an occasional slight earthquake, which does not hurt anything.

SINGULAR COINCIDENCE.—Two fires occurred in this city on Sunday night at points nearly a mile distant. The property destroyed in both instances belonged to the same parties—Messrs. Wever and Taylor. The first fire was in a slipper factory owned hy them at the corner of Mason and Geary streets—loss about $8,000—cause of fire unknown. About an hour later another fire was discovered in their warehouse corner of Market and Front streets. Loss $2,500—caught from some unknown cause in a mass of rubbish in the cellar.

THE PRESS GAG LAW.—It is stated that the Washington grand jury have found two indictments against Mr. Dana, of the New York *Sun*, on complaint of ex-Governor Shepherd. It is expected that the President will issue on the Governor of New York a requisition for the accused at an early date. So it seems the odious Press gag law is about to be put in force. A more infamous attempt on the liberty of the Press in this country never was attempted.

ANOTHER COINCIDENCE.—It was not a little remarkable that two destructive oil fires should occur at almost precisely the same hour—one at Weehawken, N. J., and the other in this city. The fire in this city occurred at the oil store of Allyne & White, 121 and 125 California street, whose loss was about $50,000. The fire at Weehawken was occasioned hy lightning. About 75,000 barrels of oil were consumed.

BISMARCK SHOT AT.—While Prince Bismarck was driving in the country near Kissingen, at noon, recently, he was fired at by a young man. The ball grazed his wrist. The wound is insignificant. The would-he assassin was promptly arrested. He has not been identified. At 1:30 P. M. Bismarck drove through Kissingen and showed himself to the public.

FIRE IN LOS ANGELES.—The Aliso flour mill at Los Angeles was destroyed hy fire on the night of Friday of last week. Loss on the building fully insured. The stock of grain on hand was a total loss, without insurance. The fire was caused hy the heating of some part of the machinery. The mill will be immediately rebuilt.

A YOUNG man of Baker City, Oregon, has a very ugly gash in his face. He was chopping wood under a clothes-line.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., July 14th, 1874.

Ayer's Hair Vigor

—FOR—

RESTORING GRAY HAIR

TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus harshy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft lustre and richness of tone it imparts.

PRACTICAL AND ANALYTICAL CHEMISTS.

☞ Sold by all Druggists and Dealers in Medicine.

CRANE & BRIGHAM, Wholesale Agents,

jy18-ss SAN FRANCISCO.

THE ONE-PLUNGER JIG,

Delivered on R. R. Car at Denver, Col., or St. Louis, Mo.,

CONTAINING SIX SIEVES, END TO END,

Separates in one and the same operation—1. galena and sulphide of silver; 2. pyrites or blende; 3. tailings, containing no valuable parts; or, 1. gold; 2. pyrites; 3. tailings (quartz, etc.) containing no valuable parts; or, 1. copper; 2. tailings, containing no valuable parts. The One-Plunger Jig can he combined with existing stamp-mills with highly important advantages, as after amalgamation it will recover completely all fine metal and all base ores and all mercury out of tailings. It concentrates all fine metal ores to such cleanness that low grade ores can be shipped, after concentration, as first-class ores. Its feed and discharge are automatic. Its construction offers better guarantee against loss and repairs than any other apparatus in use. For particulars, apply to the Inventor, F. CAZIN,

Mining and Civil Engineer, Denver City, Col.

To Mining Secretaries.

An amendment to Section 330 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements

Stockholder's Meeting—Bandereta M. & M. Co., Mariposa County, Cal.

And in accordance with the law and an order of the Board of Directors, made on the 10th day of June, 1874, so many shares of each parcel of said stock as may be necessary will be sold at public auction at the salesroom of Maurice Dore & Co., No. 326 Pine street San Francisco, California, on the 5th day of August, 1874, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. B. PAUL, Secretary.

Office—No. 318 California street, room 13, San Francisco, Cal. jy18

Enterprise Gold and Silver Mining Company.—Principal place of business, San Francisco, California. Location of works, Meadow Lake District, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of June, 1874, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 411½ California street, room 3, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 15th day of August, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

E. E. RICE, Secretary.

Office, Room 3, 411½ California street, San Francisco, Cal. jn27

Annual Meeting—Hasloe Mill and Mining Company. Location of principal place of business, San Francisco, California. Location of works, Mariposa County, State of California.

Notice is hereby given that the annual meeting of the stockholders will be held at the office of the company, 408 California street, room 14, San Francisco, California, on the 12th day of August, 1874, for the purpose of electing Trustees for the ensuing year. By order of the Board of Trustees, J. W. TRIPP, Secretary.

Land Purchasers' Association—Office, No. 425 Keerny siret, San Francisco, Cal.

There are delinquent upon the following described stock, on account of assessment (installment No. 41), levied on the 9th day of June, A. D. 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Sheres.	Amount.
J L Beyee	72	1	$10 00
T Chevallier	93	1	10 00
T Lord	68, 69 and 77	3	30 00
W E Meyhew	23, 24 and 157	3	30 00
H G Robinson	150	1	10 00
J W Eekley	175, 176	2	20 00

And in accordance with the law and an order of the Board of Directors, made on the 9th day of June, A. D. 1874, so many shares of each parcel of said stock as mey he necessary, will he sold at public auction, at the office of the Secretery 425 Kearny street, (up stairs,) San Francisco, Cal., on Tuesday, the 4th day of August, 1874, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising end expenses of sale.

C. S. WRIGHT, Secretary.

Office, No. 425 Kearny street, up stairs, San Francisco, California.

Manhattan Marble Company of California—Principal place of business, San Francisco. Location of works, Cakland, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of June, 1874, on assessment of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at his office, 212 Sansome street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 20th day of July, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 11th day of August, 1874, at noon, to pay the delinquent assessment, together with costs of advertising and expenses of sale. SAMUEL B. POPE, Secretary.

Office—212 Sansome street, San Francisco, Cal.

Ohio Consolidated Gold Mining Company. Location, West Point, Calaveras County, Cal. Principal place of business, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the Thirtieth day of May, 1874, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Directors, made on the 30th day of May, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 116 Leidesdorff street, on Monday, the 20th day of July, 1874, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. AUGS. KNAPP, Secretary.

Office—116 Leidesdorff street, San Francisco, California. jy4

Providence Gold and Silver Mining Company—Location of principal place of business, San Francisco, State of California. Location of works, Haydoa Hill, Lassen County.

Notice is hereby given, that at a meeting of the Directors, held on the 10th day of July, 1874, an assessment (No. 1) of Ten Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 331 Montgomery street, room 18, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 17th day of August, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the seventh day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WM. H. KNIGHT, Secretary.

Office—No. 331 Montgomery street, room 18, San Francisco, California. jy18

South Fork Mining and Canal Company. Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 30th day of May, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
James Adams	8	1,000	$50 00
H B Congdon	9	2,000	100 00
J W Nye	10	2,000	100 00
P H Blake	11	2,000	100 00

G E Hinckley	18	1,000	50 00
Hamm	19	1,000	50 00
E J Elzy	21	1,000	50 00

And in accordance with law and an order of the Board of Directors, made on the 30th day of May, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No. 308 Montgomery street, San Francisco, California, on Monday, the 27th day of July, 1874, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

P. H. BLAKE, Secretary.

Office—316 Montgomery street, San Francisco, Cal.

Stockholders' Meeting—Spring Valley Canal and Mining Company.

Notice is hereby given, that the annual meeting of the stockholders of the above named company, for the purpose of electing Trustees for the ensuing year, will be held at their office, No. 402 Front street, San Francisco, Cal., on Tuesday, the 21st day of July, 1874, at one o'clock P. M. By order, EGBERT JUDSON, President.

jy4-3t L. GLASS, Secretary.

Taylor Mill and Mining Company—Location of principal place of business, City and County of San Francisco, California. Location of works, Garden Valley Mining District, El Doredo County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of July, 1874, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 607 Montgomery street, in the City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of August, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the twenty-eighth (28th) day of August, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. SAMUEL S. MURPEY, Secretary.

Office, 607 Montgomery street, City and County of San Francisco, California. jy4

Electric Mining Company—Location of principal place of business, San Francisco, State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of June, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

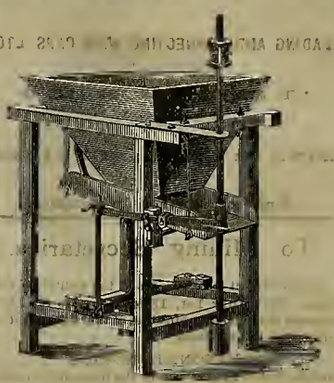
Tulloch's Automatic Ore Feeder.



At the request of Mr. Jas. Tulloch, we have carefully examined his patent Ore Feeder for Quartz Mills, now on exhibition in this city at the Pacific Foundry, and in view of its simplicity of construction, directness of action, durability and compactness, as well as its small weight and the low price at which they are held by the patentee, so as to place them within reach of all mill owners, are free to state our unqualified opinion that we regard it superior to any Ore Feeder of which we have any knowledge in actual work. We are confirmed in this opinion by the severe tests to which it has been put, doing its work thoroughly well on ores of all kinds. We find the delivery to the mortars of the ore-stuff, whether dry, damp or wet, to be entirely uniform and regular, and that even slimes and aluch can be worked in them under perfect control.

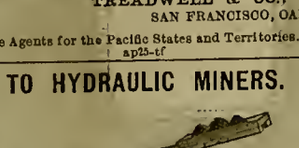
TO HYDRAULIC MINERS.



I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

TREADWELL & CO.'S
UPRIGHT SAFETY ENGINES,

2 to 10 Horse Power.

MADE BY THE N. Y. SAFETY STEAM POWER CO.

Has tubular boiler, and therefore is secure against the dangers common to shell boilers. Power is taken from near the base, which avoids vibration or top-heaviness. Occupies but two feet square of floor space and is so simple a boy can run it. All its parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the engine can be detached from the boiler and run independently, if required. Its main points are SIMPLICITY, SAFETY, and ECONOMY. For printing offices, laundries, tanneries, ranches, small repair and machine shops, or for hoisting wherever a small and safe power is required, they are peculiarly adapted.

Refer to the following parties who have them in use

E. DETTRICH & CO., Bag Factory, San Francisco;

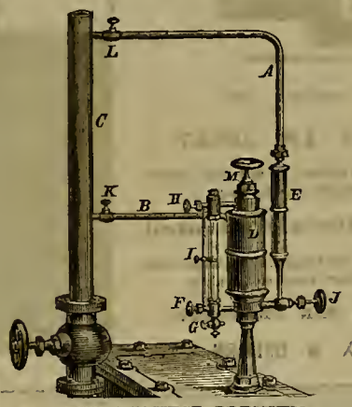
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

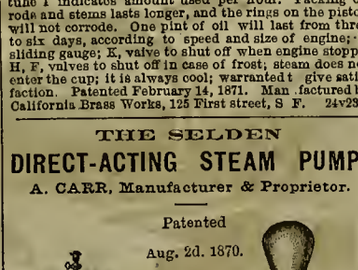
Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; 1, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

THE SELDEN
DIRECT-ACTING STEAM PUMP,

A. CARR, Manufacturer & Proprietor.

Patented
Aug. 2d. 1870.
Dec. 20th, 1870.



Combining simplicity and durability to a remarkable degree. Its parts are easy of access, and it is adapted to all purposes for which Steam Pumps are used.

As a Mining Pump it is Unsurpassed.

CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,000 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Oprates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

7v25-tf JOHN TAYLOR & CO.

Morris' Settler and Amalgamator.

PATENTED MARCH 25, 1873.

An important improvement in milling. Cheap, light, efficient and durable. Gains Quicksilver on working tailings. Is discharged from the surface in the center instead of the side, by means of a Syphon which extends to near the center of the Settler. Heaviest casting weighs only 135 pounds. The sides and bottom of the Settler are made of wood, as also Mullers, placed vertically—the friction of which brightens the quicksilver.

One of these machines is in daily operation at No. 618 Merchant street, (basement), San Francisco. Parties desiring information as to rights of use, purchase, etc., can address, FREDERICK MORRIS,
616 Merchant St., S. F.

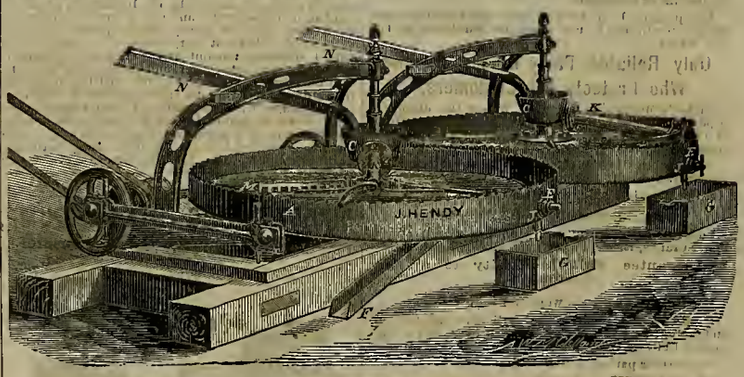
OVER $3,500 PER MONTH SAVED

BY THE USE OF

HENDY'S IMPROVED CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use.

O. C. HEWITT, Supt.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

EMPIRE MILL. (8 Concentrators)	Grass Valley, Nevada County
NORTH STAR M. & M. CO. (8 Concentrators)	Grass Valley, Nevada County
VULTURE CO. (8 Concentrators)	Prescott, Arizona
NOYES & CO'S MILL. (2 Concentrators)	Prescott, Arizona
LUCY MINING CO. (3 Concentrators)	Owyhee District, Idaho
EL TASTE CO. (3 Concentrators)	Sonora, Mexico
ST. LAWRENCE MILL	Georgetown, El Dorado Co
ST. PATRICK MILL	Newcastle, Placer Co
JULIAN MILL	Newcastle, Placer Co
VIRTUE MILL	Oregon
KEYSTONE MILL. (22 Concentrators)	Amador Co

CAUTION—All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented April 17th, 1866, and May 10th, 1868."

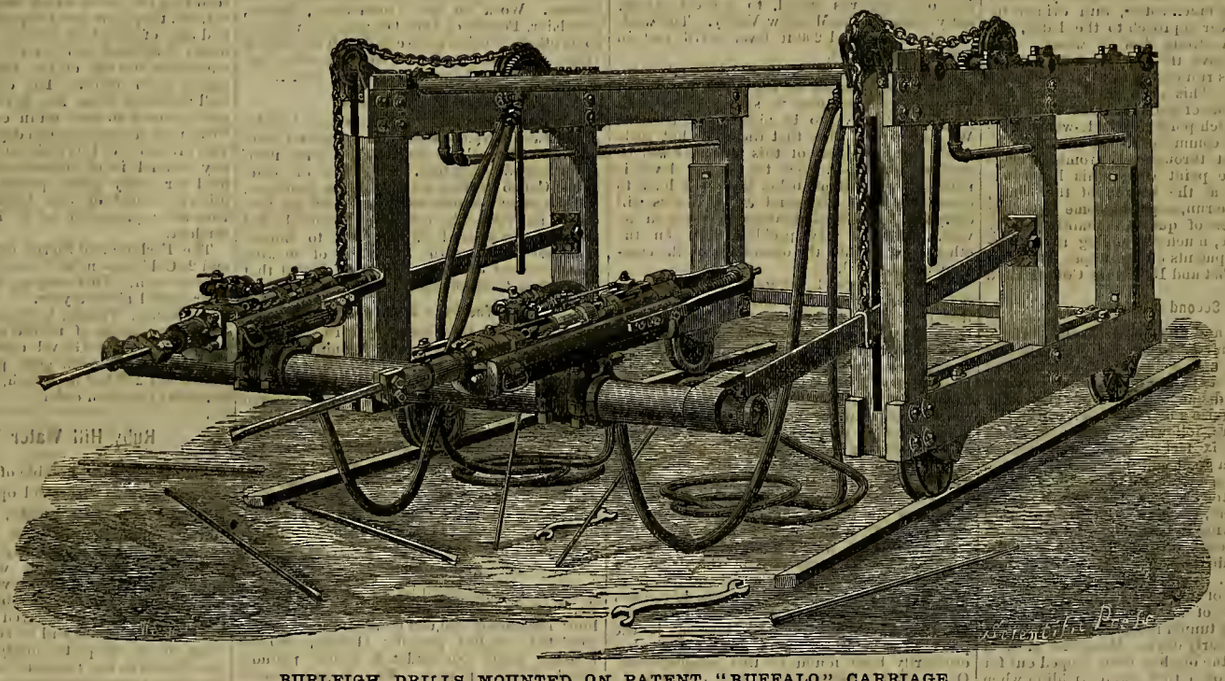
VOLUME XXIX Number 4.

Patent "Buffalo" Carriage for Burleigh Drills.

Borleigh drilla of all the different patterns are being rapidly iutroduced in the various mining districts of tho Pacifio coast. In tonneliug, this machinery is peculiarly advantageous. By ita use great worke become easy, that wonld hardly he undertaken with the old appliauces of hand labor. Besidee the great saviog made in the labor of construction, the great saving of time accomplished hy ita use secures a great saving of interest on the cost of such works. An experience of five years has enabled the manufacturers to produce very perfect appliances for the adaptation of the machinery to this class of work, and hae also demonstrated the fact of its great saving hoth of time and expense over haud labor, in favor of the Burleigh drille and compresseors.

Our engraver has prepared a cut of a style of drill just being introduced here by Measrs. Parke & Lacy agents of the Burleigh Rook Drill Co. It is a 'Buffalo' carriage for moonting two drills upon one har, which may be raised and lowered by meana of chaiue pulleya and a windlaes. It is coustructed with an open space of from four to eixteen feet in the clear, between the two sides, so that it may be run in as soon after a blaet ae the track can be cleared by throwing the rock into the center. Drilling can thus be resumed with bnt little loss of time, and the removal of rock proceed simultaneously by means of small care running upon a narrow gauge traok laid inside the carriage-track. It has jack-screws to raise it from the wheels during the drilling, and is held in place, like the smaller carriage, by screws runniug out from the ends of the upper har, or up from the frame to the roof of the tunnel.



BURLEIGH DRILLS MOUNTED ON PATENT "BUFFALO" CARRIAGE.

It is constructed of wood and iron, and runs upon iron car-wheels. A tunnel 8 feet in hight, and from 10 to 16 feet wide, can be constructed by the use of this carriage; and, by means of an enlargement carriage, the size can be increased in hight and width sufficiently for any purpose for which a tunnel will ever be needed. For runniug a double-track railroad tunnel, two carriages of this form are commonly ueed side by side.

This style of carriage is well adapted for sinking inclines iu deep mines. The working of these drills in tunnels can be seen at the Sutro tuunel, Nevada; Cedar Creek Mining Co. and Gold Run Ditch aud Mining Co., Placer county, California; also at the Belcher, Gould & Curry, Consolidated Virginia and Overman mines, in Nevada, and on the Mariposa Land aud Miniug Co'e property, aud in the Idaho (Grass Valley) mine, at all of which places they are giving entire satisfaction.

Two hundren flasks of quicksilver were shipped from Napa City last week, the product of the mines in that vicinity.

The Uses and Benefits of Industrial Fairs.

Industrial Fairs have becomo a great feature of the timos, and a most important means of advancing the iudustrial improvemeuts of the age. By them we cau best oollect and most practically disseminate information of a tangible and oseful character. Without them the world must necessarily he slow iu securing a general dissemiuation of useful inventions and improvements which, from the very nature of things, must have a local origin. The benefits derivable from the frequent collection of the products of industry, aud the assembling together of manufacturers and producers, with the evidences of their skill and industry, are heyond computation.

Each age and country has new wants whioh the progress of civilization creates, and which it is the province of ingenuity and skill to supply; and what better way can be devised to make known such wants, and secnre means for supplying them, than to bring the consumer and producer together as we see them assembled at Iudustrial Fairs—whether County, State, National or International?

There were good artificers in hrass, iron and wood long before mechanics was known as a science. But such artificers worked apart, with no interchange of experience, no rivalry of one with another, to advance the common interest and practical progress of all. There was no incentive to invention, and consequently the steam engine, the telegraph, and hundreds of other importaut and useful iuventious, without which the world would now scarcely know how to do, were not called iuto being until thousands of yeare after the pyramids and numerous cities, still magnificent in their ruins, had fully demonetrated the capacity of man to turn his skill and genius to innumerable contrivances for pleasure, convenience and profit. But in all these thousands of years there was literally no progrese whatever in the useful and practical. Not until we find men coming together in Fairs and Exhibitions to compare notes iu their products of skill and the arts, and to learn the wants of society, do we find them making any material progress. It is only about 100 years since the first effort at an exhibition of this kind was attempted iu any part of the world, and since that time more progrese has been made in invention and discovery than during all the thousands of years from the time of Tubal Cain to that of Robert Watt.

It is not claiming a whit too much for theae Fairs when we aesert that it is to the greater extent to which they have beeu introduced in this country that the Uuited States owe their preseut proud position in the van of all nations for the inventive skill of their artisans. Industrial Fairs are peculiarly a "Yankee Notion," aud afford a most siguificant proof of the advantages derivable from their general introductiou.

In our own State, Fairs havo accomplished most important ends in giving impetus to arts and manufactures on the Pacifio coast by holding out the iucentive of reputation and reward for excellence in the various branches of local iudustry. Had it not heen for the stimulating influence of our Fairs, the high value of labor among us, and the wide and varied field for its employment, would have greatly retarded our especialties of manufacture, and other produotive enterprises. In no portion of the globe hav so many and such manifold advantages been derived from suoh sources as we have here witnessed. Experience has fully demonstrated that in no other way can we so effectually secure for California a steady, industrious and contented populatiou as presenting fairly, to all new comers, and to the world, the capacity of our State for sustaining in comfort a large population, aud the facilities we offer for raisiug a large proportion thereof to competence or affluence. Let us, then, one and all, enter into a generous and friendly rivalry in gatheriug together iu the Great Industrial Pavilion which is now risiug in our midst, every possible, tangible evidence of our producing capacity, embraciug at least something, as may readily be done, in every department of labor known to the civilized world.

Parties still continue to prospect in the vicinity of Dease creek, in the Stickeen mines, though little work can be done uutil the end of the month.

The miuiug prospect of Colorado was never more promisiug than at the present time, not only for the immediate future, but for years to come.

The new road to Teal Marsh, Columbia district, will soon be completed, when shipments of borax will be made daily via Carson City.

The proposed rolling mills of the Union Pacific Railroad Company will be built at Fort Steele, 17 miles east of Rawlins.

The Ready Relief Mine.

The Ready Relief, or Bailey Bros. miue, ic Banner District, San Felipe cañon, San Diego county, has been bonded to partiee from Grass Valley for $45,000. This mine is the southerly extension of the Redman, the first ledge struck in Banner district. It was taken up hy the Bailey Bros. iu Aug. 1870, immediately after the Redmau wae discovered. It is in a peculiarly favorable situation for working, and these advautages combined with the energy of its owners, have developed it into a pretty good mine. The ledge crops boldly out on the face of the mountain on the eastern eide of the south fork of San Felipe oreek. A fine etream of water flows by it, which the ownerstapped some distance above, and by means of a ditnh and small flume brought the water to run their three-stamp mill, so as to crush their own ore. The ledge averaged from three to eight feet in thickness where it cropped out, and showed free gold iu nearly all the croppings from the point of commencement on the level of the creek to the top of the hill which risee at an angle of 40° to the hight of several hundred feet. The owners ran several levels in on the ledge and rich ore wae taken from each one. The claim oomprises 1,000 feet. The young men who own this claim have all been hard workere, aud have put their property in such shape that they deserve to get a good price for it. They first crushed their rock in arrastras, and obtaiued in that way the money necessary to erect the little mill, which has done them such good service. They have lived at the mine ever since it was located, and have done a good part of the work themselves. The mine has paid all along, but will douhtless show a heavier yield when more men are put at work and a larger mill is put up.

Since writing the above item, we learn from the San Diego *Union*, of the 8th iust., that the boud referred to has expired, and the claim was bought by Messrs. A. Neyhart & D. Schuyler of San Diego for $45,000. It is stated that the new owners propose to erect a large mill and conduct operations on a scale of some magnitude, having command of all needed capital for that purpose.

Favorable reports come from a few of the other mines in this district, the Chariot particularly showing a goodjrecord. The principal part of the population of the district has moved from Julian city down into the cañon, where most of the work is going on. The country about these mines is also a good agricultural region, in fact the best part of San Diego county, aud we notice that a flour mill is to he erected there.

D. W. Walker and Ieaac E. Shaw, of Cloverdale, have begun developing a chrome iron mine, recently discovered on Capt. Wm. H. Litton's land, a mile north of Healdsburg.

The Globe Consolidated Mine.

The Gold Hill *News* ssys: This mine comprises the old locations of the Globe, Arizona and Utah mines, consolidated iuto one. It is sitnatsd on American Flst, at the hrow of the hill, immediatsly weet of the Baltimors Consolidated aud American Flst mines. The locations are among the oldest in that section, and rank among the most favorable on American Flat. A large amonnt of monsy hss heen expended at different times, in various ways on ths sevsral locations; some in running tunnels, some in sinking winzes, and some in sinking shafts that amomnted to little more than mers prospect holss. The first work of rsal permansnt valne undsrtaken on any of the claims, was that of running the old Globe tunnel, some five years ago; that, owing to its great length—having over 2,000 feet to run—tbe extreme hardnese of much of the rock to be penetratsd, and the limited means of the company, was several years in rsaching the vicinity of the ors vsin. About a year ago, howevsr, soms of the owners, posessing great faith in the nltimate development of a paying mine, erected

Hoisting Works,

And commenced the sinking of a three-compartment working ehaft, to more thoronghly prospect and ascertain the valne of thsir ledge. These works ars on the east hillside, 300 feet bslow the croppings of the ledge. The main hnildiug is 35x90 feet in sizs, with a boiler room 16x40 and a carpenter shop 26x30 fsst adjoining. The engine and other hoisting machinery is calculated to he of sufficient power to work the mine to a depth of 800 feet. The shaft has besn sunk to the depth of 400 feet. At the

Fourth Station,

Or 400-foot level, a main west drift has been drivsn in a distance of 450 feet from the shaft, most of ths way through rock of extrsme hardness. The rock in the face of the drift was at the time of our visit to the mine, yesterday morning, getting much softer, with evident indications of a nesr approach to the ledge, and the tapping of a strong flow of water. One hnndred feet above this ie the tbird station drift, which was rnn eastward to prospect the Arizona ledge. This drift struck some fine quartz, with epots of good ore, 110 feet from the ehaft, at whicb point a double-working incline winze was oommenced, and snnk to the depth of 100 feet, through very promising ledge matter. At the point where this ledge was etruok and also at the bottom of the winze, oroes drifts were rnn, expoeing some fine and extensive bodies of quartz, containing many epots of rich ore, mnch resembling in appearance the developments on the upper levels of the American Flat and Baltimore Consolidated mines. At the

Second Station,

Two hundred and fifty feet from the eurface, a drift has been run to connect with the old Globe tuunel, and following in a distance of 2,000 feet from its mouth is an incline raise-up 320 feet. At a distance of 100 feet from the bottom of thie raise a drift hae been run 70 feet to the northward, following the ore vein, which is here five to six feet in width, well defined and the ore of a good milling quality. At the head of the raise a drift has been run 200 feet, also following the ore vein, the face of which is still in fine ore, the vein evidently widening out and improving in both look and quality ae the work progreses. Ninety-five feet from the mouth of this drift a wiuze is now heing sunk on the ore vein. Tbis winze is down 45 feet. From the head of the incline another winzs extends a distance of 170 feet to the level of an old prospecting tunnel in the croppiugs of the ledge, run in early days. Along the sides of the lsst wiuze the ore has heen stoped out for some distance on either hand, yielding when crushed an average of $22 per ton. Extending upward from the head of the 320-foot inclins there are already many tons of good milling ore in sight; and extending dowu from that level the ledge is as yet comparatively unproepected, and hids fair to greatly improve when developed on the lower levels.

The Globe tunnel furnishes a steady living stream of 40 inches of water, at the mouth of whioh the grading is heing done for the erectiou of a fine 20-stamp

Mill,

The main huilding of which will be 52x70 feet in size, with a hoiler room adjoiuing, 24x30 feet. The eteam power for running the mill will he furniehed hy two 54-inch boilers 16 feet in length. The engine is to have a 20-iuch cylinder and 42-inch etroke, and the amalgamating department is to contain four nine-feet settlers and eight five-foot improved amalgamating paue. The situation of this mill heing such as to euabls them to dump their ores directly at the hatteries without a eecond handling, will ueoesearily make a vast saving in the cost of working, and enable the company to work with a profit mnch of the low grade ore that would not otherwise pay. The enperintendence of this mine is under the ahle management of Mr. Frank Thayer, a thoroughly practical and efficisnt miner, who will certainly leave nothing within his power undone to make it a dividend-payiug mine.

Gambetta says the French Assembly is a orpse, rendy for the grave-digger.

Pioche Mines.

The Pioche *Record* of the 12th says: Ysster-day we hsd the plssure of meetiug Captain Day, the Supsrintendsnt of ths Raymond & Ely, who returned a day or two since from San Francisco. He informs ns that the contrsct for supplying pumps and gsaring irons for the rods, engines and hoilsrs, and all other fittings for setting np the pumping machinery, has bsen taken by H. J. Booth & Co., of San Francisco, and that establishmsnt is now at work and is to complsts the contract in ninety days from the dats of signing. The machinery is to be of the most snbetantial character, and the sngine will be one of the vsry largsst that has heeu sst up in the Stats—only one other, that of the Savags, equalling it in sizs. The pump-rods has besn contracted for and will be supplied by a firm at Alta. The rods will bs made of red spruce, the toughest and most desirahle matsrial for such parposes on ths coast. In order to pnt the rods and pumps in place, the pumping compartment of the Lightner shaft will have to be enlarged, and the work will be commenced to-morrow. We cannot but exprsse our gratification that steps have bsen taken to procure machinsry to frse the shaft from water, so that the exploration of the vein bslow the water-level will he resumed. The grsat extent and continnity of the Raymond & Ely lsdgs, both in length and depth, has removed all doubts as to its being a trne fissure vein, and we feel ssrtain that the discovery of ore equalling, perhaps excssding the famons bonanza struck in ths Lightnsr shaft, is simply a question of time. The mine, as it stands at prssent, differs hut little from its appearance when we last visited it. The sonthwestsrn and eastern drifts on the 1,200-ft, and the drift on the 1,000-ft. levels, show the same as heretofore in their faces. The only altsration simply has been in their being opened to a greater extsnt. The mills are working on tailings, bnt ths yield has not heen so good as heretofore. The Magnet company are raising daily from 25 to 30 tons of ore, which on being worked yields reasonably well.

As regards the condition of the mine the foregoing remsrks would, to a great sxtent, aptly describe the Msadow Vallsy. The western drift of the 1,200-ft lsvel is176 feet in length; the east 69.

The Summit shaft is now 1,106 feet deep, and ie being pushed as rapidly as possible. If pumping machinery is set up by the company it will have to he placed in this shaft. Wa underetand also that there is but little doubt that machinery of thie character will be erected, for when once the water level is reached explorations below that will have to oease, nnlese the Raymond & Ely works will carry the whole accumulation of water on the vein, which is very problematical. In the other departmente the operations of the company are ae nsual.

The appearance of thiugs at the Pioche are more cheering than they have been for some time paet. The explorations of the new ground lying between the new ehaft aud the new works has revealed a coneiderable thicknese, carrying ore in large quantities. For a distance of over 400 feet the ledge has been opened, and is continuously ore-bearing, and from the regular nature of the formation in which it is imbedded, it may he expected to contiuue eo. One of the greatest diffioulties the minere in this region have to coutend with is the great number of faults caused by the intrusiou of dykes of harren rock, but the ground recently opened in the Pioche, under the euperintendence of T. R. Butler, apaears to be eingularly free from these nuwelcome visitors. For a length of 600 feet traversed by the drifts, the formation seems nnnsually even and free from breaks. A great number of assays have heen made from the ledge hy Mr. Bntler in person, and they all show a very large increass in the percentage of gold, mnch greater than has ordinarily been found in this neighborhood. Ore is already heing raised and preparations are being made to take it out in large quantities, if the deposit continues, of which there is every appearance at present.

At the American Flag the shaft has reached 1,000 feet in depth, and a station is being opened at that point. Other things are much the same. The mill is at work partly on tailings aud partly on ore. A shipment of bullion was made yesterday of something over $5,000.

The Newark miue ie progressing as nsual. The work on the new shaft contiuues without change. Ore ie heing taken from the old workings, which is reduced at the compsny's mill, from which source considerahle bullion is heing obtained.

New Mexican Mines.—The *Mining Life* says: Meesre. Black, Bullard and Yankie returned from a thirteen days' trip through the Fresco country on Wednesday. They report the gold diggere from Silver City as heing en ronte for the placer diggiugs, hut were unahle to learn in what exact locality they expect to find the diggings, and np to the tims of going to press uone of the various parties had retnrned, so that we have no data from which to judge of the prohahle succees of any of them. We hope they may be lncky enongh to find good surface diggings, hut the prospects are a little donhtful at present. Last Sunday'e coach took $3,975 in hullion; $2,530 of this was from the Tennessee mill, the halance from various sources. Ahout $400 in bullion was taken to Galleana by citizens of Chihuahua; making a total of $5,375 for the week, and leaving here about $1,200, the product of the Pope mill for last week.

Eureka Mines.

The Eureka *Sentinel* of the 12th inst. says: As a ruls, our leading minss are well established as reliahle ore prodncers, and special changs in their condition seldom transpires within the period of a week. All have magnificent bodies of ore, and the work of extracting and reducing the eame to hullion progresses steadily and satisfactorily. Taken all in all, the outlook is all that conld be desired, the leading mines of the district giving every evidence of richness and permanency. The

Ruby Hill Mines

Are now showing better on the lowsr levels than at any previons time in their history. At all points along the great ore bslt, dspth in the various shafts serves to demoustrate the extent of the deposit, and that it sxtends deep down into the bowels of the earth is no longer a matter of speculation.

The Richmond, Eureka Consolidated and K K

Ars each sending to the surface an nnnsually large amount of ore, and in most instances the ore is of a highsr grade than formerly obtained. These minee continue to employ the nsnal quota of men, and the amount of ore shipped to the furnaces is also abont the same as formerly given in these colmns.

The Furnaces

Are being driven to their fullest capacity, as is shown by the daily shipments of bullion. We are told that the coal rsceipts hsve not been qnite so largs the past wesk as formsrly, thongh we hays not the figures at hand to draw a comparison on this subject. No reason has been assigned for this falling off in the dsmand of fuel, and we can only account for it on the hypothssis that the smelting works had a sufficient supply on hand to ssrve them for a brief ssason. Matters in this lins msy, thsrefore, be expected to resume their wonted cheerfulness very speedily.

Prospect Mountain.

A grsat deal of wsll-directed mining and prospscting is bsing carried forward on the grand old mountain, which many bslieve will yet turn ont to bs the real backbone of the district. Work on the Dunderbsrg, Morris, Excelsior, Fourth of Jnly, Orangs, and perhaps some others is heing prosecoted with the utmost vigor, and the reenlts in all cases are of the most gratifying charecter. Further over in

Secret Canon District

The aspect of affairs is very cheering. Geddes & Bertraud have on their dump several hundred tons of excellent ore, and the mine itself never looked hetter than now. The ore body in tbe Calico incline, we are told, is immenee, and the other portions of the mine are as promising as ever. The owners of this celebrated property commenced shipping ore to Eureka the pset week, with the view of making another grand clean-up. It is predioted that they will net $50,000 on this trip.

The Page & Corwin

Is sgain coming into notoriety. In the early days it was oue of the best paying minee in this sectiou of the State, much of the ore going ae high as $1,000 per ton. The ledge was lost, however, and for a time the mine was allowed to remain idle. Lately it was leaeed by J. W. Sullivan, and doring the past week he mado a very important development, finding what appears to be a good hody of ore, assays of which have been obtained ranging ae high as $1,138 24. A considerable quantity of ore has been taken out and ehipped to the Hoosac furnace for smelting. It is said to make wonderfnlly high-grade bullion.

Bullion Stalistics.

Tbere were prodnced by the several farnaces during the week the following amounts of bullion: Richmond, 300,000 pounds; Eureka Consolidated, 232,000 pounds; Hoosac, 160,000 pounds; Ruby Consolidated, 70,000 pounds. Total, 762,000 ponnds. The furnacee made ehipmente dnring the same time ae follows: Richmond, 220,299 pounds; Consolidated, 273,211 pouuds; Ruhy, 13,000; Hoosac, 52,070 pounds—total, 675,582 ponnds. Snrplue on hand for the wsek awaiting ehipmeut, 96,418 ponnds.

California Mioroscopical Society.—The stated meeting of this eociety was held on the 10th inst., and in addition to the resident members present, Dr. J. H. Wythe and H. Edwards, honorary members, and Mr. W. R. Barber were present ae vieitors. The meeting was informal, yet those present found matter interesting enongh to detain them for several honrs. Mr. Edwards presented a parasitic hemipterons insect, found in ferns, and the peculiarities of its ova, yonng and fully developed epecies were noted for some time. Dr. Wythe exhibited several slides, monnted hy himself, ehowing miunte dissections of the caterpillar of the sphinx moth, including voluntary mnscles, tissue of stomach and urinary tubercles, stsined with carminate of ammonia. Several valnable donatione were made hy varions members, and an interesting paper on the insect infesting the engar plantations of the Sandwioh Islands, by Henry Edwarde, was laid over nntil the next regularmeeting of the society.

The Rhode Island Locomotive Works, Providence, have heen awarded a contract, amounting to $555,000, for the oonstruction of 50 first-clase engines for the Grand Trunk railway of Canada. The works will be placed on full working time, with a full complement of hands.

Sierra County Mines.

We condense the following items from the correspondence of the *Mountain Messenger*:

Chaparral hill, just above Oak ranch, whsre ten years sgo one hundrsd cabins were and 300 men, now boasts only four csbins and two men. The gravsl at Cooper'e prospects well, Two hundrsd fset square of gravel hss heen washed awsy this season at Kimball's hydrsulic diggings, at Eureks. Baird & Co. will clean np in a few days. Water is expected to last until August. Gsorge Parent is superintending Bliss' diggings, which promise to yield well this season. Folsom & Mnlholland are husy at their claim, and will continue to work throngh July. E. M. Parks is sluicing at Chaparral hill, and is said to be doing wsll.

The Galena claim, at Morristown, owned hy Csmpbell, Doherty & Perkins, is being worked day and night, and evsry indication shows that the rsturns will be large. Twelvs claims have besn washed away hy ths American company this season. This company has enough gravel to last 20 odd years. The hydranlic claims hsreabouts promise to yield wsll this year.

The Bunksr hill company, at Little Grizzly, two months ago pitohsd off east into a chansl of nice hlne gravel, and followed it 20 fest; and are now putting down an incline, whioh it will take ahout fonr weeks to complste.

The Comet company will wash seven claims during the season, and each claim will pay about $3,000. The Monitor claim, Chittenden & Co., have stripped a large amount of bedrock. Sears Union Co., at Granite Hill, havs swept the monntains away hy the wholesals, baring many acres of rock with their two monitors rnnning. From every indioation satisfactory rstnrns will undonbtedly he the result, nndsr the able and ensrgetio superintendent, F. A. Gonrlsy. They are now hottoming up, employing sevsnty-five men.

The Empire mining company, at Potosi, ars busily at work, and their claim is paying well. They have 2,000 fset of flume, 18 by 18 inchss, with iron riffles. Length of main tunnsl, 3,300 fest; using Manson's chilled wheels and revolving car axlss, which ars pronouncsd excellent; they have good apparatns for washing, and one of the best dumps in ths country; depth of air shaft 335 fest, of which 85 fsst was snnk from the top of the ridge, and 250 fe t raised from below. The outside works are well protected from fire, having 140 feet head alwaye ready to turn on in oase of an alarm. Fifty men are employed on day and night shifts. The prospects of this claim are promisiug. Its pay channel ie of immenee width, showing a field for many yeare' profitable labor. This mine is owned by San Francisco capitalists, who are represented by J. Denoon, euperintendent.

The Fashion and Sierra companies, Noe. 1 and 2, Cold cañon, will soon put on a large force of men. This company hae heen running their tunnel ahont a year.

Newhouse, Wolters, McDonald, Jackson and Fradett, residente of northern Sierra, are developing the Mt. Gravel claim, Onion valley, Plumas county, with good proepects. Their tnnuel is 1,200 feet in length, and all working machinery in good order.

Ruby Hill Water Works.

Among the most notahle of the different enterprisee now in enccessful operation on Rnby Hill, the new water works, owned by W. B. Harrnh, of Eureka, is most prominent. The amount of money necessarily expended in perfecting the arrangements, whereby the town might be supplied with a never failing supply of water, has heen considerable, and had it not heen for the energy displayed by Mr. Harrnh, the residents wonld still he euffering from the want of an adeqnate supply of good water. But thanks to the foresight and resolution of the ahove named gentleman, all cause of complaint in this direction is now ohviated. The supply of water now on hand far exceeds the demaud, and if necessary it could he more than douhled. The water for the use of the town is contained in five large tanks, three having a nnited capacity of 84,000 gallons, and two of 16,000 gallons eaoh, all of whioh are always kept full. Besides this the K K and Enreka Coneolidated Companiee' tanks, holding 16,000 gallons each, are kept filled. The Richmond company is erecting a tauk to hold 20,000 gallons, and another of the same size ae the latter is heing oonstructed for town purpoees, and when completed the amount daily kept on hand will exceed 150,000 gallons. The water ueed by the company is brought through pipes and ditches from eprings in New York cañon, where a large reservoir is alwaye kept filled. In addition to this supply, which is fully adeqnate to meet all demands, Mr. Harrnh has recently purchased the Way springs, situated in Secret cañon, and ie now having a ditch oonstrncted to this point. From thie eource alone enongh water cau he obtsined not only to supply the towu hut also furnieh a snfficient qnantity necessary to be used in a smelting fnrnace. It is thought hy some interested in the ersction of snch a furnace that an adequate amount cannot he obtained, bnt we have the assurance of those who know the requirements of such an undertaking that a plentiful eupply is obtainahle for euch a purpoee. W. H. Dickson, the snperintendent of the company, ie one who hae a thorongh understanding of the business, and nnder his management ite affairs are in a most prosperous condition.—*Eureka Sentinel.*

Scientific Progress.

Velocity of Nervous Impulses.

However slow the rate of nervous movement may be, as compared with the velocity of light or the still fleeter motion of electricity, it is nevertheless so rapid that until quite recently it was thought to be immeasurable, within the limited range in which our observation of it is possible. The most widely separated points in the course of any nerve allow but a few feet of difference at best for timing the periods of sensation or volition; and the nervous impulse travels so quickly that such small distances would seem to be wholly annihilated. To our consciousness a prick on the great toe is discovered as promptly as one on the cheek; and it is only by the intervention of the most delicate and ingenious of mechanical contrivances that the difference in time is made apparent.

In all the early experiments on motor nerves, the leg of a frog had been used. In 1867, Baxt and Helmholtz applied the test to man, using an improvement of the myographicon suggested by Dn Bois Raymond. The result gave the rate of conduction for the motor nerves of man, corresponding to that already obtained by Hirsch for the sensory nerves. A very careful series of experiments by the same observers, in the summer of 1869, showed a mean rapidity for the motor nerves in man very much greater, or about 254 feet a second.

The measurement of the rate at which the nervous impulse travels brainward necessarily involves a process very different from any employed in the study of motor nerves. The problem was first attacked by the Swiss astronomer, Dr. Hirsch, soon after Helmholtz took up the other branch of the investigation, and his solution of it was as ingenious as it was successful. It involved the measurement, with the delicate chronometric instruments employed by astronomers, of the difference in time between the appreciation of impressions made at a distance from the brain, say on the great toe, and others nearer, as on the cheek. Roughly described, the plan adopted was substantially this: The observer sat with his finger on a signal key, with which he announced the perception of an electric shock as soon as possible after feeling it, thus closing an electric circuit which had been broken by the shock. The minute interval between the breaking and closing of the circuit measured the time taken by the transmission of the shock to the brain, the time required for the perception of the sensation, time for willing the movement of the signal key, time for the transmission of this volition to the proper muscles, time for the contraction of the muscles, and finally the time lost in the physical process of signaling. Obviously all these parts, except the first, must be substantially the same in all experiments by the same person, using the same finger for making the signal. Any difference in the whole time must therefore be owing to the greater or smaller distance of the particular point of impression from the brain. This difference being measured with tolerable exactness, it is possible to calculate pretty closely the rate at which the nervous impulse is transmitted. The estimate first made by Dr. Hirsch was, as already noted, 111 feet a second. More recent determinations give averages ranging from 97 feet, by Dr. Sohleske, to 136 feet, Wittich's estimate for a nervous impulse excited by electricity. With a mechanical stimulus, he found an average velocity of 124 feet. These figures, of course, are to be taken relatively. The rate varies in different individuals, and, doubtless, in the same individual, with varying conditions of health, temperature, and so on, the general average being about that of a high wind, a race horse, or a locomotive. Light excels it about ten million times, and electricity more than fifteen million times.—*Scientific American.*

Photography at the Bottom of the Sea.—Nenmayer recently exhibited to the Berlin Geographical Society a photographic apparatus designed for the determination of the temperature and of the currents at great depths in the ocean. The invention is composed of a copper box, hermetically sealed and furnished with an exterior appendix, made like a rudder. In the interior is a mercury thermometer and a compass, each enclosed in a glass receptacle, in which are admitted traces of nitrogen gas. A small electric battery completes the apparatus. When the latter is allowed to descend, attached to a sounding line, the action of the current on its rudder causes it to assume a parallel direction, thus indicating the set of the flow by the relative position of the compass, needle and rudder. The thermometer, of course, shows the surrounding temperature. In order to fix these indications, a piece of photographic paper is suitably disposed near the glass cases containing the instruments. Then at the proper time a current of electricity is established through the gas in the receptacles, causing an intense violet light, capable of acting chemically upon the paper for a sufficient length of time to allow of the photography thereon of the shadows of the compass needle and of the mercury column. Within three minutes, it is said, the operation is complete, when the apparatus is hoisted and the paper removed.

Abbe Fiehol has recently constructed a new battery, using a Spanish mineral, which is probably a kind of pyrites. The battery is constant, and it has been found that, after 18 months' continuous use, it operates as well as when first employed.

Men of Science.

Mr. Francis Galton, F. R. S., delivered a lecture at the Royal Institution, from which we gather the following interesting remarks: The data for the subject were the information furnished in the replies to the schedules sent out by the lecturer to 180 of the leading scientific men of the day, which were taken in total at about 300. Of these half were in age between 50 and 65; three-quarters were English, and, as compared to the general population, the proportion was 1 in 6,000. The inquiry was then made into the causes which gave rise to these positions of eminence. Scientific discoveries were necessarily rare, and in some degree the course of individual mark was a race against time. Most remarkable, however, was the almost persistent combination of remarkable energy of body with remarkable energy of mind. The returns made to the lecturer were necessarily confidential, but he quoted extracts to show illustrations of each topic. Size of head was considered, and as a general rule was larger than of ordinary gentlemen. Still, remarkably many scientific men had small heads, and the small heads were remarkable for activity. Health, again, was a marked feature. Independence of spirit and tenacity of purpose were also most marked characteristics of men of science, and notably a large proportion were men of business as principals of large commercial or mercantile concerns.

There were ten medical men also in the highest ranks of their profession, and 18 others in high posts not being professorships. The great incentive to science seemed to the author to be innate taste, and in character he regarded the scientific mind as anti-feminine. As to hereditary qualities, that of health seemed most essentially due to parentage; and on the parental side the influence of qualities was apparently on the father's side. The author appeared to consider that a combination of all essential qualities was necessary to the production of a man of mark, and that the laws of chances and alternatives came in to give activity to the results. In regard to education, the general condition seemed to be that they were not tied down in their studies to particular subjects, but were given to the investigation of many; and that they had been in contact with persons of many ranks of society. There was a regret expressed of the time spent on classics in numerous instances and a general appreciation of, or desire for, a knowledge of mathematics; and admission in many cases of the value and influence of home teachings. Finally, the lecturer advocated a national enlargement of moderate means of livelihood for those who desired to follow science, and the formation of a sort of scientific priesthood, with a view to the utilization of science to the general good..

Temperature of the Earth.—In this country the earth's temperature is constant at a depth of about 50 feet, where the temperature is about 50° Fah. The rate of increase of temperature is in our coal mines generally 1° Fah. for every 60 feet of depth. It is questionable, however, whether after a great depth the rate of increase does not prove more rapid than before. At the deepest coal pit in England, namely, that at Rosebridge, near Wigan, where the shaft is now 2,376 feet deep, and is still descending, there is a ratio of heat increase agreed with the ordinary rate down to a depth of 1,800 feet, after which it became considerably more rapid. At the lowest point of the sinking the thermometer indicated 92° Fah.—*The Engineer.*

Detection of Phosphorus.—In testing bodies supposed to have been poisoned by phosporns, the fatty matters present are an inconvenience. By Van Bastelaar's method the liquid is rapidly shaken up with ether; the ethereal extract is evaporated, under protection from dust. At the end of the operation a few drops of distilled water are added to hinder the action of the air upon the phosphorus. Under the water is deposited a liquid globule composed of phosporns and fat. This is placed in a small tube, and agitated with strong ammonia at 21°; the ammonia is removed by washing, first with very dilute sulphuric acid, and then with water. The phosphorus then remains, with all its physical and chemical properties.

Evolution of Gases from Molten Cast-Iron.—Ledebur thinks the evolution of gases is due to the three following causes: First, to those gases which have been absorbed by the molten metal within the furnace, and which are again evolved when the metal is cast, owing either to diminished pressure, to a greater motion of the iron, or to the iron again solidifying. Second, to a formation of gases produced by chemical reactions taking place when the molten metal comes in contact with the air. Third, to a formation of gases produced by chemical process in consequence of the contact of the molten iron with the molds.

Delicate galvanometers should never be kept in the field of permanent magnets, unless, as in the case of the mariner's compass, they are free to move in the direction of the lines of forces of the magnetic field in which they lie, otherwise they will quickly lose their magnetism.

Thallium in minerals may be detected by the spectroscope, when present in the proportion of 1 to 500,000.

Proofs are given that ozone is soluble to a slight extent.

Mechanical Progress.

Watches.

Nalthropp, in his "Treatise on Watch-work," laments that even educated men know but little of the handy machines they carry in their pockets. Most people know a watch when they see it—this they cannot fail to do; but as to distinguishing between a lever and a horizontal, still less a "verge," they are profoundly ignorant. Even in the matter of identifying a "compensation" balance, the average bearer of a watch is deficient, as is proved by the number of imitations abroad, which to the cursory observer present all the appearance of the genuine article. Mr. Nalthropp says truly that the owner of a watch ought not to be satisfied unless he knows enough about its working and construction to intelligently appreciate the really scientific workman—if he finds him—into whose hands he commits his little machine for repair. Further than this, there are many minor things about watches that ought to be known by ordinary people, which will enable them to care for their timekeepers in an intelligent manner. For instance, more watches are spoilt by hasty and irregular winding-up than by most other causes, and a thoughtful man ought to discover for himself that our author's advice on the subject is sound. A watch, he says, is much like a child, requiring uniform treatment, "that is to say plainly, not over-indulged to-day, neglected to-morrow." Winding-up should be performed regularly, with a steady and uniform motion, not moving both hands, and nearly as possible at the same hour daily. A watch should always be kept at the same temperature as nearly as possible. Left overnight on a stone mantelpiece, it is sure to gain, or if the oil gets thickened, it may stop, to be started again by the warmth of the pocket. The regulator is too often viewed as an appendage more to be looked at with wonder than to be used, while the persons who can explain the theory of its action are few in the extreme. Yet the task of learning enough about a watch to become capable of talking intelligently about it, and exercising the control over a "jobber" which that knowledge is certain to give, is but slight, and it ought to be reckoned as blameworthy to be ignorant about one's watch as to know nothing of the merits of one's boots or clothing. Mr. Nalthropp gives to the uninitiated a few hints as to the purchase of a watch which are worth reproducing. The case, be it gold or silver, should be correctly made and of fair thickness; the hinges close and smooth; the glass well fitted; the dial of clear, bright enamel; the seconds sunk, and the whole of good weight when held in the hand. When the dome is opened—for it is better that a watch-case should be so made, though more expensive—the brass-work should look well-finished, the edges smoothed off, the steel of a diamond-like polish, the jewels pale in color, but of a fine, clear luster; the action of the spiral spring should be even, when the watch is set going.

The N. Y. *Herald's* new press has attracted much attention among printers and engineers. The dimensions of this machine are as follows: Length, 11 feet; width, 7 feet; length of cylinders, six feet; diameter of main cylinder, five feet; weight, 15 tons. It is furnished with four flys, which enable it to dispose of the sheets as fast as the press can print them. The main feature of this machine is that the roll of paper is taken from the top of the cylinder and fixed on uprights at the back of the press, connected with the cylinder by means of a roller; the cutting of the paper is done *after* instead of *before* printing, the cutting cylinder being in the rear instead of the front of the machine, doing away with cams, grippers and tapes for carrying the cut sheets from one cylinder to another, and by this means obtaining a higher rate of speed. Compared with the Hoe ten-cylinder, the labor-saving is immense, when we consider that it takes 15 men to work it effectively, while the Bullock—the new press—requires the attendance of but three, and the saving in expense of running is averaged at $18,000 a year—almost the cost of the Bullock press.

New Mechanical Cutter-Out.—A firm of Glasgow ready-made clothiers have just introduced a new machine for cutting out garments which will be the means of saving much labor. The "band machine," generally in use for cutting out shirts and other articles is ill adapted for cutting out heavy garments, some more expeditious tool being needed. In the Warth machine the scissors action is substituted for the revolving blade. A piece of steel about an inch and a-half long descends upon a slot, and thus cuts its way when propelled by steam at the rate of 700 "snips" a minute, covering at the same time over two yards of material.

Paper from Jute.—The Dundee *Advertiser* has been printed on paper made entirely from Calcutta jute cuttings. The *Advertiser's* opinion of the paper is as follows: "It is an excellent paper, but not quite so bright in color as we could have wished, more resembling the color of paper supplied to print second-class books. We intend trying again to have a parcel of paper made of a good, bright color. The paper we have made is, however, very tough, splendid in every particular for the newspaper trade."

Testing Armor Plates.

In England, before the plates are sent to the dockyard, one or more are chosen at random by a government official to be tested. The plates are fastened to a target erected at one end of the ship, and shots are fired at them from guns of prescribed caliber, in a battery at the other end, the men being protected from the splinters of the shot by a casement. If the plate does not stand the test satisfactorily, the lot from which it was selected is rejected. This system of tests seems as good an article as it is possible to make. During the first few years of the manufacture it was found that the plates were often split and cracked by the shot, in the neighborhood of the holes which had to be bored through them for the screws or bolts by which they are attached to the targets. It was thus assumed that these holes were necessarily a source of great weakness, and many schemes were proposed for connecting plates with the ship's side in ways by which this important defect might be avoided. One was that an iron frame should be attached to the ship and the plate dropped into it, the edges of the frame being afterward beaten over to secure the plate in its place. The necessity for anything of this kind has been obviated by the great improvements which have been effected in the quality of the armor; the metal now used is so tenacious that it is scarcely any weaker in the neighborhood of a bolt hole than in any other place. The superiority of the armor of the present day over that made 10 years ago was fully exemplified in the recent experiments on the turret of the "Glatton." A hole was punched through one of her 14-inch plates by the shot, but there was no other damage done to the plate than the mere penetration. Under similar circumstances in the case of plates experimented upon some years ago, there would be seen large cracks radiating from the shot hole, producing a complete separation of the plate as far as the nearest bolt holes, and in many cases the armor plate would have been broken in two or three pieces.

A Compound Locomotive.

An ingenious member of the Manchester Scientific and Mechanical Society proposes to apply the compound principle to locomotives. This is how he sets about it, says the *English Mechanic:* He would use steam of 250 lbs. on the square inch to work the small cylinder, and expand this steam into a supplementary boiler bearing a pressure of 60 or 65 lbs. to the square inch, so as to have a surface of effective pressure of 180 lbs. or 190 lbs. in the small cylinder, or about 60 or 65 lbs. in the larger one. The principal alterations proposed are in the boiler. In adapting his plan to a locomotive of the medium size, he would make the boiler two feet longer than at present, and divide it into two distinct parts, the part containing the furnace or fire box to be two feet shorter than at present, so as to have the supplementary boiler four feet longer, both being equal in diameter, and equal in number, size and position of tubes, the two parts of the boiler being firmly bolted together, and so arranged that the tubes of one are in a line with the other, so the hot air and flame may pass freely through from one to the other. An important advantage claimed by the plan is that the driver of the locomotive will be enabled to start his engine with the full power of steam in both cylinders at once, which he could not do, if compounded in the usual way. Although this plan will require extra outlay, there will be a considerable saving in fuel, which, with other advantages, it is claimed, will more than compensate for the extra cost. We are not surprised to hear that discussion followed the reading of the paper, in which the feasibility of the plan was generally condemned. Ultimately, however, the discussion was adjourned, in order that the inventor might give further information on the subject.

Liquefying Gases.—M. Mellens saturates charcoal with an amount of chlorine whose weight will be equal to that of the charcoal, places it in one limb of a V-shaped tube, sealing both extremities thereof, and applies boiling water to this limb, causing the volatilized chlorine to rise in the other limb, when, under the pressure produced, it may be liquefied by dipping the latter limb in a freezing mixture. He liquefies ammonia, sulphurous, hydro-sulphuric and hydro-bromic acids, chloride of ethyl and cyanogen in the same manner.

Hollow Bars for Furnaces.—The chief features of novelty in this invention are: Forming the hollow bars of cast iron having two or more longitudinal water passages; providing the ends of the passages with removable screw-plugs or other stoppers to facilitate cleaning; double-chambered hearing-pieces to supply water to bars; placing the double-chambered bearing-piece in the middle of long bars; supplying the feed-water in some cases from a surface condenser.

Improved Fish-Grappling Spear.—The spear barbs are jointed together and provided with springs, which are bent when the hooks are opened, and held by the toggle joint until the latter is sprung, and then close them with sufficient force to secure the fish.

The Preece block system of electric railway signalizing is working on the principle that the trains are to be kept a certain unvarying distance apart. No train can advance until the signal is given that the line for the specific distance ahead is absolutely clear.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

Mining Stocks.

Most of the prominent mining stocks show a decline in prices this week, the stock market having been rather dull. Idaho stocks have gone down very low, indeed. Chariot Mill is the only one of the California stocks that shows any strength.

Prices have varied as follows: Alpha Cons. ran between $11 and $12.50; American Flat, $6.50 and $7.50; Baltimore Cons., $7 and $8; Belcher, $62 and $74.50; Best & Belcher, $23 and $24; Caledonia, $15 and $17.50; California, $36 and $39.50; Chollar, $49.50 and $62; Confidence, $10 and $11.50; Cons. Virginia, $78 and $82.50; Crown Point, $66 and $78; Dardanelles, $7.50 and $9.50; Exchequer, $59 and $64; Gould & Curry, $18 and $19.50; Hale & Norcross, $43.75 and $50; Imperial, $6.75 and $8.12; Julia, $2.25 and $3; Justice, $6.75 and $8; Kentuck, $12 and $14.50; Knickerbocker, $2.25 and $4; New York Cons., $1.75 and $3; Ophir, $16.50 and $17.50; Overman, $25 and $33.50; Savage, $72.50 and $79.50; Seg. Belcher, $68 and $74; Sierra Nevada, $20 and $23.50; Trench, $4 and $6; Utah, $2.50 and $4; Yellow Jacket, $72 and $81.50; Eureka Cons., $12.50 and $13.50; Meadow Valley, $6.50 and $7.50; Pioche, $5.50 and $6.50; Raymond & Ely, $15.50 and $16.50.

Prominent declines from highest prices of last week were as follows: Alpha Cons., $1; Belcher, $10.50; Best & Belcher, 50c.; Caledonia, $1; Chollar, $6; Confidence, 50c.; Cons. Gold Hill Quartz, 75c.; Crown Point, $4; Exchequer, $1; Franklin, 50c.; Gould & Curry, $1.50; Hale & Norcross, $1.50; Julia, 50c.; Kentuck, 50c.; Knickerbocker, $1; Ophir, 50c.; Rock Island, 75c.; Savage, $10.50; Seg. Belcher, $7.50; Sierra Nevada, $1; Silver Hill, $1; Succor, 50c.; Sutro, 50c.; Trench, $2; Utah, 50c.; Yellow Jacket, $7.

The Dayton mining company last week shipped a single ton of hullion from Virginia City, valued at $12,815.

The Wide West mine, in Idaho, was sold last week to Warren Hussey, President of the First National Bank, at Salt Lake City.

A Chinese company are engaged in brick-making at Nevada City.

Patents for Mining Claims.

Patents have recently been issued for the following mining claims:

California: El Dorado county, Joseph French, Yellow Jacket lode; Jacob Spickert and others, placer; Nevada county, Horace Kilham, placer; Jas. K. Byrne, Union Hill quartz mine; Tuolumne county, Confidence mining company, Confidence quartz mine and mill.

Colorado: Gilpin county, Chicago gold company, Buckeye, Monroe and Kansas lodes; Clear Creek county, J. Warren Brown, Fingal lode; Robt. O. Old, R. O. Old, lode and mill site; Marshal county, Silvester mining company, tunnel lodes Nos. 5 and 6; Lewis Wolfley Bell, tunnel lode No. 1; Park county, James Moynahan and others, placer; Summit county, Henry M. Teller, Chataqua lode.

Montana: Deer Lodge county, John O'Ronrke and others, two placers; Lewis and Clarke counties, John Behing and others, placer; Thos. A Ray and others, placer; Wm. H. Stymeet, placer; Meagher county, Joe. Eball, placer.

Nevada: Nye county, H. G. Ayere, State Line lode; West gold and silver mining company, Silver Moon lode; Northern Star gold and silver mining company, North Star lode; Esmeralda county, Wm. Sharon, Juniata lode; A. L. Greeley and others, Last Chance lode; Lyon county, Thomas Brooke and others, South Comstock lode.

Utah: Salt Lake county, John McDonald, Flora Temple lode; John McDonald and others, Jacob Aetor lode; C. G. Hussey and others, Pioneer mine; Toole City, Joseph E. Clayton, Trafalgar lode.

Arizona: Yavapai county, Levi Bashford and others, Tiger lode.

Quicksilver.—The *Commercial Herald* gives the following as the exports of quicksilver by sea from January 1st, 1874, to July 1st, 1874:

To	Flasks.	Value.
New York	26	$3,000
Mexico	1,632	159,998
Chili	404	39,888
New Zealand	31	3,050
Bolivia	134	13,805
China	100	9,663
Japan	56	5,717
Central America	9	850
British Columbia	2	207
Totals first six months, 1874	2,453	$236,073
Totals first six months, 1873	2,585	173,973
Totals first six months, 1872	5,728	372,430
Totals first six months, 1871	8,360	489,784

Overland shipments for the first six months of 1873, 230,040 lbs. gross; first five months of 1874, 201,528 lbs. gross.

The schooner building by the Vallejo shipwrights on the co-operative principle will be ready for launching in about two months.

The First National Bank, at Helena, Montana, purchased 2,000 ounces in gold dust during the first week in July.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior in proximity to the mines mentioned:

California.

ALPINE COUNTY.

Silver Glance.—*Chronicle*, July 11: On Tuesday last, essayer Hunter assayed ore taken from the bottom of the shaft, and the result was: Gold $45.21; silver, $193.37; total, $238.58.

AMADOR COUNTY.

From Middle Bar.—Cor. *Dispatch*, July 18: Messrs. Stewart & McKenny have just struck the richest thing out. They struck the main lead about ten feet from the surface, and the rock is immensely rich. Several tons of this rich ore have been taken out and laid aside, in which gold is plainly visible to the naked eye. Several other companies are at work on their claims, and we may soon expect to hear of similar strikes being made in this vicinity. On the same vein where the strikes above mentioned have just been made, and further north toward Murphy's ridge, similar strikes were made several years ago, where the gold-bearing rock could be found near the surface; but no attempt has yet been made to follow the vein down to any considerable depth, as water has always been a great obstacle in the way of deep sinking.

BUTTE COUNTY.

The Out-look.—*Northern Enterprise*, July 18: The mineral wealth of the county does not diminish, but is rather increasing. Cherokee, Bull creek, Centerville, Butte creek, Forbestown, Morris ravine, etc., are all camps of great energy and large yield, and each year, from improved facilities, add to the supply of gold

CALAVERAS COUNTY.

Mining Items.—*Chronicle*, July 18: Quartz mining is brisk. Last week the new shaft of the Enterprise Consolidated, on Mina Rica lode, entered the vein at the depth of 90 feet. The splendid walls, with soft gouge on each, denote a true fissure vein. The ore measures 4½ ft. in width. One-third of this, on the east wall, will mill not less than $50 per ton; the balance is low grade. The Zacatero mill is completed. Large quantities of fine-looking ore have accumulated on the dumps; crushing will begin Monday. The new Crocker mill of the Ohio commenced work last Wednesday. Numbers of millmen and miners are visiting the mill, watching its action with considerable interest. Miller & Co.'s mine continues to

yield rich, heavy sulphuretted ore. The company intend to put up reduction-works at an early day. Quite a number of profitable discoveries have been made lately above the junction of the North and South Forks.

THE QUAKER CITY MINE.—Messrs. McGarr, Driscoll and Cohan, contractors, are engaged in piping away some 60 feet of earth, which must be removed to make room for a hurdy gurdy wheel. The shaft on this claim is down to a depth of 160 feet and shows a vein some four feet wide, which prospects well. Work continues on John Lahey's gravel claim, near the same, with encouraging prospects. Duryea's celebrated gravel claim, near the "Hill," is being worked on an extensive scale, and continues to pay well.

EL DORADO COUNTY.

MINING NOTES.—*Republican*, July 16: The Blue Ledge Quartz Mining Co. is showing some splendid milling ore. No gold can be seen in the rock, but it prospects about $40 to the ton. The mine's location is Spanish Flat. They have a tunnel in 200 feet, and are now sinking on the chimney.

THE force upon the ditch is being daily increased, and numbers now about 1,000 men. The company certainly mean business, and by another year we shall have the benefit of all the waste water of the American river and its tributaries above Cedar Rock, the point where the ditch strikes the river. This is what we have all waited for for years. It remains to be seen whether we shall be entirely happy when the work is completed.

KERN COUNTY.

SAN EMIDIO MINE.—*Southern Californian*, July 16: About a year ago a mine was discovered in the San Emidio cañon, about forty miles from this place, which proved upon assay to be very rich in base metals. No attempt, however, has been made to work the mine yet, on account of its distance from market, and the difficulty of transportation. The owners, upon the completion of the road to this place, design commencing operations on the mine. It is their purpose to send the ore to San Francisco, where it can be reduced. If the ores will pay, of which there seems to be little or no doubt, the enterprise will develop into a vast and lucrative business, perhaps not second to the Cerro Gordo mines, which are of the same character. We learn that the railroad company, with a laudable desire to encourage such enterprises, and thereby increase its own business, has made liberal arrangements for transportation with the mining company, and the latter is now purchasing mule teams and wagons for hauling the ore to this place for shipment.

LAKE COUNTY.

A PROMISING MINE.—We were shown at Lower Lake some handsome specimens from a mine in this county called the Chief of the Hill. It is on the south west side of Big Sulphur, half a mile below Eagle rock. The owners are Robert Bucknell, C. C. Rice, W. J. Rice, Geo. Bucknell, L. Garnett, D. V. Thompson and Geo. Herndon, all of Lower Lake.

MARIPOSA COUNTY.

HORNITOS ITEMS.—Correspondence *Gazette*, July 18: The lower level of the Campodonico mine is 110 feet below the surface, on an incline of about 45 degrees, following the regular dip of the ledge easterly, the general strike of the vein being north and south. The main shaft is now about 95 feet below the 110-ft. level, and shows a vein at the bottom about eight feet wide, only a small portion of which, however, is pay ore. The mine is at present being worked almost entirely by Chinamen, and the ore hoisted by hand. About one mile northeast of Campodonico's mine is the old No. 9 mine, owned by Major Hardwick & Son. Many thousand tons of rock from this mine have been worked at various times, some of which have paid at a pretty high figure; but recently it has ranged from six to nine dollars per ton. About 2,000 tons crushed at the Gaines mill, a little over a year ago, yielded $7 37½ per ton, on an average, but as the cost of crushing was $4, and hauling $1 50, it did not pay over expenses, as the cost of breaking and raising the rock to the surface was also from $1 50 to $2 per ton. But as this vein is very large, and has not been worked more than thirty or forty feet perpendicular, below the surface, and is therefore capable of yielding an enormous quantity of the above grade, the Major has wisely concluded to put down the expense to correspond with the situation.

NAPA COUNTY.

CALISTOGA SILVER MINES.—*Free Press*, July 18: Three car-loads of machinery, including the boiler and engine, and the mortars for the mill, in all about thirty tons, arrived here on Thursday last, to be forwarded to this mine. Two more car-loads of machinery and other requisites for this mill arrived yesterday. About forty men are now employed at the mine and mill, and the assay office is in full blast. The rock from the pay streak in the end of the tunnel assays $573, and the entire ledge at a depth of 150 feet averages over $100 by assay. About 700 tons of the rock is now ready for milling. It is expected that the mill will be in running order by the 10th of August.

NEVADA COUNTY.

MOORE'S FLAT ITEMS.—Cor. *Transcript*, July 18: We have one of the liveliest camps in the county. The Milton company have made this their headquarters for their men who are clearing off the line of ditch. There are about thirty men employed now, and more are coming. If the ditch is not dug by contract, but by the company hiring men, there will be nearly 200 men employed.

THE mines at Moore's are running from daylight to dark, and gold in chunks is being taken out. One specimen worth $2,500 was picked up in the Illinois mine recently, and a $90 chunk was found in the Blue Bank company a day or two ago. A $60 nugget was also found in the Orleans Flat claims, which had been carelessly thrown on one side. Lots of dust is being taken out the bed-rock claims of Shively and Joseph.

DEADMAN'S FLAT.—The Seven Thirty mine is located on Deadman's Flat. Within the last two weeks three men have taken out over $2,000 in specimens. Deadman's Flat is a place that has been prospected but little. There are a large number of ledges in sight, and all of them carry gold. There is considerable prospecting being done in that neighborhood now.

STRIKE IN THE NEW YORK HILL MINE.—*Union*, July 17: We understand that a splendid strike was made yesterday in the New York Hill mine. The quartz in the end of the tunnel shows well with free gold, and the rock is also charged heavily with gold-bearing sulphurets.

BLUE GRAVEL.—*Tidings*, July 18: This tunnel, near Mooney Flat, is now in 800 feet, and they have 1,400 more to make before reaching pay dirt. It takes grit and backbone to open up these diggings, but they pay.

IDAHO.—At the Idaho mine in this place every thing is running briskly. The machine drills are proving a decided success, and so much rock is broken up that it keeps the hoisting machinery busy to get it to surface. No. 2 giant powder is being introduced in parts of the mine, and miners are not feeling in the best of humor about it. The old shaft is being put in condition for the reception of a large new pump for the freeing of the mine from water, when the capacity of the present pumps is reached.

PLACER COUNTY.

MINING NEWS.—*Herald*, July 18: Work on the Bellevue is progressing finely, and the openings show well. Ten stamps of the St. Patrick mill are pounding away steadily on Bellevue ore, and by the last of the month a big clean-up is reasonably expected. We also learn that the company have commenced re-opening the old St. Patrick mine proper. Also, the old Doig mine is being re-opened by the St. Patrick company.

ORLEANS MINE.—A clean-up from this mine last week, gave $4,500; a good return, when we consider that a considerable portion of the rock was not equal in quality to what is now being taken out.

ST. PATRICK.—Superintendent Crossman reports favorable progress in the Crater mine. The shaft is being sunk for the 500-ft level and the rock is improving.

SAN LUIS OBISPO

MINING ITEMS.—*Tribune*, July 18: Dr. Cochrane, in behalf of the company he represents, paid the first installment of $2,000 on the Oceanic quicksilver mine last week. Work has commenced on this mine in earnest now, and we look for good results.

THE Todos Santos still looms up. Men are at work prospecting on the claim with excellent indications. They are taking out rich rock.

SIERRA COUNTY.

THE MINES.—*Mountain Messenger*, July 18: Everything seems favorable for a good water season. By this time, most years, there is no more than enough water to clean up with; but this year there will, probably, be water till along in August.

GOOD PROSPECTS.—The York boys have run a drifting tunnel some 80 ft. in their claim, and find good pay all the way.

SOLD.—The Johnson quartz ledge on Little Rock creek has been sold to Clough & Jillson. The rock shows plenty of free gold. The ledge will be developed now.

SISKIYOU COUNTY.

LEDGE STRUCK IN THE LODI.—Yreka *Union*, July 18: We have heretofore announced that the company owning the Lodi quartz claim, near Cottonwood, had resumed work on it this summer. Before the suspension of work some two or three years ago, a tunnel had been commenced, intended to strike the ledge at a much lower level than has yet been reached. At the resumption of work this summer, men were placed in this tunnel to push it forward till the ledge should be reached. The report now is that the ledge has been struck, that it is from 2 to 2½ ft. thick, and that the rock looks and prospects well. We sincerely hope it may turn out equal to the most sanguine anticipations of its owners.

THE JOHNSON QUARTZ CLAIM.—A. M. Johnson & Co. continue working on their quartz claim in the ridge, between Oro Fino and Mugginsville. They have sunk a shaft on the ledge to the depth of 100 ft. Several small lots of rock have been crushed with very satisfactory results.

TRINITY COUNTY.

FROM TRINITY CENTER.—Cor. *Journal*, July 18: Our miners still continue busy, making the most of the water while it lasts. Allison & Co. have men employed now, night and day, in their claim. Their Little Giant has been at work for some time and seems to give satisfaction. The Shoo Fly Hill Co. are making preparations for another blast on their bank. Their main drift is to be 30 ft. long, with two branch drifts, the whole forming an undergound T—one of these branches to be also 30 feet, and the other yet to be determined by the lay of the bank.

THE Cinnabar mine is turning out lots of ore, we hear, and Mr. Lytle is on the lookout for laborers, both whites and Chinamen. The crude apparatus which he has hitherto had has not warranted him in smelting much of the precious sulphuret, but such as has been produced is pronounced to be superior in quality, of which there are several pounds on exhibition at this place. The old saw mill is no more, and another is soon to go up in its place. At present the work goes rather slowly, but it is being done thoroughly, and all the machinery and appointments of the new establishment will be first-class, from what we have seen.

PAIN WELL.—James A. Johnson & Co., on Indian Creek, last week cleaned up 346 ounces from a run of two months. During the season Johnson & Co. have stripped 25,000 feet of bed rock, and the sum total of their clean-up from this amount of work has been over 500 ounces.

TUOLUMNE COUNTY.

ACCIDENT.—*Independent*, July 18: The overshot wheel at the Consuella mill has broken to smithereens; and to expedite the prospecting of the mine a new one will have to be put in. The rock prospects well, although as yet no regular chute has been found.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, July 16: Daily yield, 300 tons of ore, keeping the dumps full and the Co's mills all running up to their full working capacity. The ore breasts on the 1,200, 1,300 and 1,400-ft. levels are all looking splendidly, and promise a big yield of ore for many months to come. The necessary preperatory work for the erection of the new mill is making all the headway possible, about 100 men being now employed in completing the preparations.

HALE AND NORCROSS.—Sinking the main incline, which had been delayed for a few days by the putting in of a water tank 50 ft. below the 2,000-ft. level, has been resumed and is again making fine headway. The north drift on the 2,000-ft. level is still pushed vigorously forward to connect with the south drift on the same level from the Savage, following a very promising seam of ore lying next to the east wall with excellent indications of finding paying bodies whenever cross-cutting the ledge shall have been commenced. Daily yield, 40 tons of ore from the old upper workings.

IMPERIAL-EMPIRE.—The station timbers are being put in to-day for opening a drift at the 2,000-ft. level. The east drift, on the 1,850-ft. level, has been again started up, and three days ago cut a rich stratum of ore two feet in thickness, crossing the face of the drift diagonally, and assaying from $743 to $1,110 per ton. This ore still continues at the bottom of the drift, the assay of which gives $120 per ton. The main south drift on this level has passed out of the ore body previously reported, being run directly to intercept and connect with the winze from the 1,700-ft. level for air purposes. The ore was penetrated by this drift for a distance of 45 feet, and where it leaves the face of the drift assayed $69 per ton. The indications are excellent, not only for the development of a fine body of ore on this level, but for finding an extensive body lying between the 1,700 and 1,850-ft. levels.

BELCHER.—The mine was shut down on Saturday last for the purpose of putting in a new hoisting cable, laying a new iron track in the main incline, putting in a new fly and spur wheel for the hoisting engine, and making other necessary repairs. The ore breasts on the 1,000, 1,200 and 1,300-ft. levels are all looking well and yielding finely.

GLOBE CONSOLIDATED.—The ore breasts are looking finely, and yielding about 20 tons of ore daily. The ore in the west drift, from the bottom of the north winze, at the third station level, has greatly improved in both quantity and quality during the past two days. A slight leakage of water from the face of the drift has set in, and there seems but little doubt but that the ledge is in close proximity.

LADY WASHINGTON.—The new pumping machinery has arrived and is being put in position for use.

WOONVILLE.—Daily yield twenty tons of ore, keeping the mill steadily running. The ore-stopes on the 300-ft. level are showing a decided improvement. The ore in the north drift, on the 400-ft. level is also opening out stronger and of an improved quality.

CHOLLA-POTOSI.—Daily yield of ore, 100 tons, the assay value of which is $30 per ton. The ore breasts on the upper levels show little or no change during the week. The main south drift at the fifth station level is still pushed vigorously ahead, occasionally cutting small streaks of ore, but finding nothing of permanent value.

SAVAGE.—Sinking the main incline below the 2,000-ft. level is making good headway, the rock in the bottom working finely. The main south drift on the 2,000-ft. level, has been enlarged, timbered and put in good working condition, and cross-cutting, for the purpose of determining the value of the ledge on that level has been commenced.

GOULD & CURRY.—The prospecting operations on the 1,500-ft. level show no change worthy of mention. Drifting and cross-cutting on the fourth station level is still vigorously prosecuted, with no ore developments of value to report.

OPHIR.—Daily yield, 50 tons of ore, which is being extracted from the ore breasts on the 1,300-ft. level and in opening the ore stopes on the 1,465-ft. level. The ore breasts on both of those levels are opening up well, and promise a goodly yield for the future.

JULIA.—Almost the entire work in this mine is being concentrated on the enlargement of the shaft and the foundations for the new machinery.

AMERICAN FLAT.—A station has been opened at the 750-ft. level of the Baltimore Consolidated shaft, and a drift just started to prospect the ledge on that level. The ore prospects on the level above were excellent, and there seems but little doubt that paying ore bodies will be found on this level.

OVERMAN.—The north drift at the 200-ft. station, in the winze from the 1,000-ft. level has developed a streak of quartz about four feet in width.

YELLOW JACKET.—The 1,700-ft. station is completed and ready to commence drifting for the ledge on that level. Sinking the east winze, from the 1,610-ft. level, is making good headway.

TYLER.—East drift, at the second station level, has penetrated the ore vein a distance of 10 ft., and is not yet through it. The ore is of a low grade, and the ledge is not very promising.

BALTIMORE CONSOLIDATED.—Sinking the shaft is making fair progress. The flow of water continues slight, but not enough to at all impede the progress of the work.

JUSTICE.—The extraction of ore from the Waller Defeat section of the mine still continues, with a slight improvement in the quality.

CALEDONIA.—Sinking the main shaft below the 800-ft. level is making good progress, although the rock in the bottom is somewhat harder than at our last report.

LEO.—The ore vein in the face of the main drift is now about 15 inches wide and improves somewhat in quality as the drift progresses. The general indications are very favorable.

NEW YORK.—The 600-ft. station, on both the east and west sides of the shaft, is opened out ready for starting drifts both east and west.

PHIL. SHERIDAN.—New shaft down 108 feet to-day, with the bottom in good sinking ground and occasional stringers of quartz coming in. The new steam hoisting machinery is being put in place.

KOSSUTH.—The foundations for the new machinery are about complete, and the whole will soon be in running order, when sinking the main shaft and prospecting the first station level will be resumed.

NEVADA.—The new tunnel for another level in the ledge, 100 feet below the present ore workings, is progressing finely. It will open up a large extent of pay ore.

FLORIDA.—New shaft down 157 feet. Ground works well, and water does not impede progress.

SIERRA NEVADA.—Daily yield, 60 tons of ore, keeping the mill steadily running. The hydraulic works are doing excellent execution. Work on the new machinery is progressing as fast as it is possible to crowd it, every man being employed for whom a place can be found to work. It is expected that everything will be completed, ready to start up these works, by the first of next month, and when fully completed, they will have no superior in the State.

CROWN POINT.—Daily yield, 550 tons of ore, which is mostly taken from the 1,000, 1,300 and 1,400-ft. levels. The mine is looking splendidly throughout, and promises a rich yield for many months to come. The 1,400-ft. level is looking much better than was at first expected, and the prospects of the 1,500-ft. level are growing more favorable every day.

DAYTON.—The third compartment of the shaft is about completed to the water level. On Monday last the hoisting of water from the shaft was commenced; and, contrary to the general expectation, has already been lowered a distance of 50 feet, so there is now strong hopes of soon again having the mine drained, and the resumption of work on the lower levels.

LADY BRYAN.—The shaft has passed through a belt of hard rock, and the west side is entering a body of clay considerably mixed with quartz of a much softer nature than the material heretofore penetrated, affording strong indications of a near approach to the ledge.

KNICKERBOCKER.—The shaft is down 200 ft. below the 400-ft. level, and preparations are being made to open a new station at that level.

UTAH.—The flow of water from the bottom of the shaft still continues; it is, however, gradually slacking off.

SUTRO.—The main west tunnel is still driven vigorously ahead, the rock in the face working finely.

SILVER HILL.—The main south drift on the third station level is still pushed ahead, running through promising vein matter.

SUCCOR.—The erection of the new machinery is about completed.

SENATOR.—Sinking the new shaft is making good progress. It is now down 80 ft. below the 400-ft. level.

DANEY.—The main west drift on the 400-ft. level is in 160 ft., the rock in the face being somewhat softer.

PICTOU.—No water interferes and the work is being driven ahead vigoronsly.

CALIFORNIA.—Both the north drifts on the 1,400 and 1,500-ft. levels are making good progress without change of interest to report.

ALAMO.—Sinking the shaft is making good progress, the bottom still in good ore.

OCCIDENTAL.—Sinking the double winze from the tunnel level is still making good headway, the bottom still in ore.

DARDANELLES.—Sinking the new shaft is making fair headway, the rock in the bottom blasting quite hard.

MINT.—Sinking the shaft is making good headway; the rock in the bottom is quite soft.

Resources of Nevada.

The first decade of our existence ae a State ie passing away. As greet changee hava taken place during the past 12 or 15 yaare, on the eastern elope of the Sierres, and betwaan them and Great Selt Lake, it might be well for us to inquire: What are the resonrcee of Nevada? Evente crowd npon the march of tima, and possibilities long dorment are being revaaled among tha probable, soon to anter the ranke of the positive and assume a placa among tha actualitiee of life, to constitnta tha facts of history. Little dreamed the emigrant who wandad hie way ecroee the plains and desarts of the Great Besin in 1849 and 1850, beholding only the general outlinee of the conntry through which he passed, noting perhape the ciaggy hight of mountaina grand, thair granite peaks, volcanic cones upheaved and fissured, hille rent and ecorched by volcanic force and fires, that thesa grease-wood, saga and eandy wastes, so arid and desolate than, would ever be anything better; or that the rock-ribbed hills, eo ecattered, and monntaine bald, wera girt with belts of ora, or bound in zonas of argentina. Only a few yeare have passed, and the miner who than took up hie march scaled untrodden hights to view the desert waetes of ealt, sand and alkali, cen now look from those eummits and behold the city, town or mining camp—perhape may eee the emoka from mills and hear the hum and olang of thair movemant and power. Where ha went forth without a guide or trail to tha fer interior, and his white face, was first gazad upon by the Indians, now teams with deeert echoonars and trail wegons, laden with merchandise and minere' supplies.

Peopla in some countries can scercely form an idea of what nsed to be known as the Great Basin, where towering mountaine stand forth alone, or range iaolated from range, eurroundad or separated by milee of harren waete, and the eummits of the separated mountains 20, 30, perhaps 50 miles apart. Rivars and streams flow from many of these, yet some of them are deetitute of water and unclad with soil or trea. Some streame have green vallays, rich with alluvial deposits. Theee monntains, streams and lakes; these valleye, salt marshee and borax deposits, constitnta the depoeitorias of Navada'a resonrces. The principle of adaptation, the law of substitution and adjuatment, aided by tha natural elements, must he brought into requisition, and he bound to the car of progresa, that what does exist may yield and contribute to man'e good. These mountaine contain gold, eilver, copper, laad and iron. Soma of the marahes contain aalt, borate of lime, borate of eoda, saltpeter, magnesia, atc. Some streams and lakae ahound with fish; othar streame hava none. In aome of the valleye grass is ahundant; a portion of tha plains produces white saga brush, bnnch graes, etc., enitable for flocks and herde; and with planty of water, most of tha sage hrueh land in valleys would produce good grain. In eome places fruit would douhtlees do wall. Now the inquiry arises: What oan he dona to oombina the elemente, the agancies and forces at command, and by the utilization of common things, compel nature to yiald her productione so prolifically as to increasa tha resources of Nevada beyond tha largeet precedant of the past?—*Borax Miner.*

Straw-Burning Engines.

Editors Preee:—I notice an article in your velnable paper of the 4th inetant, headed "Straw-bnrning Enginee." I heg leave to annonnce through your columns that I hold letters patent on two etraw-burning devicee. The patente I ohtained through your agency, one being dated February 11th, 1873, and the other May 20th, 1873. These devices can not be excelled for eimplicity and efficiency, when applied to the return flue boiler patented hy H. W. Rice, of Haywood, Alameda county, which patent wae also obtained through your agency. My straw-hurner consists of a aimple attachment to the aperture of the furnace door, to prevent the cold draft of air from passing into the furnace, as the etraw fuel ie introduced. Thie device requirea no belt to run it, and no one to turn it by crank when the engine ia not running, in order to get up steam. A twelve-year-old boy oan fire with perfect ease any return flue, ateam threshing engine with dry atraw, hay or weede of any desoription, inetead of usiug machinery to place thie fuel in the furnace. I uae an ordinary hay fork. One ton of straw will thresh one thonsand sacks of grain. These devices can now be seen at work in the valleye of San Joaquin, Livermore, Alameda, Santa Clara, Santa Maria, and many other places. Mesere. Treadwell & Co., corner Market and Fremont atreets, San Francisco, are the eole agents for the Pacific Coast.

D. Morey.

Watsonville, Cal., July 12th, 1874.

Tybo Distarct.—We are pleased to record the evidences of success ahown by the company operating, under the direction of John B. McGee, at Tybo. There are now about 100 men in camp, moetly employed by the company. The machinery for the oonstruction of a 40-ton furnace ie already on the ground, and the furnace itself will shortly be erected and in operation. We hope the new enterprise may he a auocese, and the energetic owners reap a subetantial benefit. Dr. Gally has well merited hie good fortune in selling the property, having etuck to it many years.—*White Pine News.*

How About Silk Culture?

All human enterprises have apparently as many etages of existenca, and play about as meny perts es man himself. The eelf-accueing spirit of the Amarican people prompte them to confess a euperlative degrea of guilt in aome rather ordinary crimes. They acknowledge themeelvee to ha particularly addicted to "running thinga into the ground;" to making costly idole ona day and tearing them to pieces tha next; teking up eome new enterpriea in a hasty manner, concentrating thair hopee and energies upon them, and leaving them "in disgnet" juet at the time when they ought to have stuck to them. Our foreign neighbors and adopted citizens ara ever ready to yield an unqualified aseent toall these eelf-accusatione of ours; and eomahow managa to thns escapa eimilar chargee, which might be as juetly laid at their doore. Of those eins, or rather weaknesee, which we acknowledga as national cheractaristice, but are really mera failiuge, posessed by the whola hnman family, the dispoeition to be etill baginning and nevar ending is conepicuone. And among tha thinge which we have rushed into wildly, and backed out of hurriedly, eilk culture stande forth ae a recent and conepicuone example.

The extravagant hopes foundad on tha prospective silk bneinass, and the injudicious managament of its incipient etages, are too fresh in the memorisa of our readers to render a recital of them nacessary; but we hava faith that this, with other incipient enterprisee of this country, will yet rica from their graves, and that the day of reeurrection for tha eilk businece, especially, is not far off. The expected profits of the anterprisa ware poeeibly overaetimatad, and impatienca undoubtedly mieled reaeon in looking after immediata reeults; but the abandonment of the undertaking was brought about by more realistic causes. The misdiracted State patronaga whioh induced the planting of myriads of a worthleee clasa of mulberry treea, auhmitting the matter to the control of a corrupt ring, oreated a deapeeated diegust in the public mind which ie really unjust, and is detrimantal to the publio interesta. It ie now asserted that certain foreign elemants, operating in our midst, were actively and effioiently employed in blighting our silk intarests to eave those of their own countrias.

But the errors and folliee alluded to abova will admit of speedy oorrection upon a revival of the active interest in the matter; and it only neede a conviction of tha inimical influencee having been axerted against them, to aronaa and nnita the energiea of our peopla. The natural advantagea whioh soma portions of California, aapecially that in the vioinity of San Francisco, poeeess for eilk onltura were probably never ovarrated. They remain the same and can bide their time; and even another failure on our part would not precluda the next generation from placing thie among the important indnetriee of the country.

Close etudants and patient axparimenters in this intareating art are now, and have continued from tha first, evolving new theoriea, and reducing old ones to practice; and when they predict, as they do, that within ten yeara every family in and ahout San Francisoo, who ara diaposed eo to do, can make two or three hundrad dollars per annum hy feeding eilk worms, we ara hardly disposed to treat their theory aa vieionary. While the hasty popular verdict announces that silk culture in this country is "played out," new varieties of eilk worms are being introduced here, and new methods of treatment aro being practiced.

We would not decignedly do anything that would have a tendency to revive the former excitement on this enhject; but we fear that in onr haste to diepose of buaineee enterpriees, and even still loftier undertakinge, which are declared to have "had their day," there have heen some cases of "buried alive;" and we do not desire to see human efforts, any more than tha human hody, put nnder ground before life is extinct.

Plucky but Prudent.—A contributor to the *Weekly Sutter Banner* congratulatee the citizene of Levee District No. 1, of Sutter county, on the succees which has crowned their efforts to protect themaelvea from the melting of the vast accumulation of enow in the mountains. The residents of that locality realize that they have received aubstantial rewarde for the labor and expense hestowed upon their levee; for they can at preeent show hundreds of thouaands of acres of as fine wheat and barley as can anywhere be seen, while they have reason to helieve that without the protection of their land the water would have ewept away this with all the rest of their posseeeions. But the writer, who evidently represents the spirit of the neighoorhood, is not diaposed to eettle down into supposed safety. After meting out the full complement of praise and congratulations to hie fellow citizens, for the work performed end the rewarde secured, he closes as follows: Now, we by our earthworke, have been able to keep the threatening waters at bay, hut we must not remain idle in the future; because, while the enemy has heen eurging at our gatee, it has been busy bringing down material from the mountaina, and building counter-works on our front, from which, in the future, it can more euccessfully assail ue; and, unless we are more vigilant, we may be yet overcome, and our fall will only be the more terrible the louger it shall be delayed.

The Rattlesnake Quicksilver Mine.

This mine ie fiva milee northwest of Pina Flat, which wae sold abont the middle of March, to Lightnar, Parrott & Co., by the original proprietors, Snow, Mackay and Sleeper, and hee made a large progrees in tha work of development. From tha firet tnnnel, at a point 40 feet from the entrance from the open cut, a shaft two and a helf by threa feet was sunk, to reach the eecond level of the second tunnel since eunk. On Wednasday last, a' blaet wae pnt in hy H. R. Brown, foreman, at the bottom of the shaft, which opaned the connection and displayed a fina body of ore, hetter, indead, than any previously seen. Tha company will continua to eink on the lina of this ehaft into tha tunnel below, which will be 275 feet from the eecond leval.

Mr. Leonard, of San José, is putting up a kiln of 100,000 bricke, which will be hurnt the coming week, aud ready for the construction of a 20-ton furnace. The caetings and other iron work ara daily expected. Tha furnaca will he of the Lnokhardt patent. The company hee already a boarding housa completed, 16x40, and lodging house of the same dimensione. They hava a forca of men now engaged in laying iron 1-inch pipe to eupply the boarding house, adohe yard, stable, etc. The size of the furnaca building is 45x90 feet, axclusiva of ore ehed and other minor erections. The timber road running from the mine to tha timber, a dietanca of two milee, under tha supervieion of Mr. D. Nicholson, will be complated within a week. Mr. Richard Wood hae charge of getting out the required timber. He is an old gentleman who has epacial faith in tha "lightning saw," and can, all alone, do a vast amount of work with it. Sixteen whita man and abont 60 Chinamen are now amployed—and a larger force will be put on Tuesday. Carpentere ara on the spot, eupplied with the neceesary lumber to erect an offica for tha Superintendent. The lumber was furniehed by Heald & Guerne, of Healdeburg, and Hudson & Ward of the aame place. The company have already completed their wagon road from Pina Flat, passing the Sonoma mina to tha Rattleanake, witb the expectation of tha Missouri company contiuuing on to connect with the Healdahurg and Geyaer road, which will be a main thoronghfare to tha Kantuck, Lost Ledga, Emma, Geyser and Cloverdale mines.

The original locatore of the Rattleenaka mine, Forbes & Sleeper, are working tha Cedar, New York and Pacifio, with a good proepect. Mr. Forbea has found the proepect eo favorable that he has removed his family from Lakeport to Pine Flat, and is a atirring and intalligent worker. R. Opie, Superintendant of the Chinamen, running the lower level of the Rattlesnake, is doing bett r with them thera than any force that haa thua far been amployed.—*Napa Reporter.*

Wild Coffee.

We entreat our farmere in tha foot-hills not to lose sight of the plant which is now called wild coffee. From information derived from intelligant persons familiar with coffee plantations, we undaretand that it ia a apecies of the coffee tree. In their wild state neither the tea plant nor the coffee maka an acceptable heverage. It ia by selection and cultivation that such plants, like our fruite, become adapted to our tastae.

Doubtless it will be fonnd that there are many varieties, among which may he eome of euperior qnality, which may furnish grafts for others that may be better for standards. We may find it best to import cultivated etock and graft on our acclimated trees.

The buckeye which cumbere our wilderness is a apeciea of horee chestnut, which it ie equally nnwiae to overlook. Herr Schmitt, who made efforte to raise the tea plant on a large ecale in El Dorado county, had alao young chestnut trees from Japan. He engrafted several cnttings on buckeye trees with succese. The grafte found a congenial home with the new foeter mother. An unexpected calamity destroyed the tea plants, and the enterpriaing Prnssian ahandoned the place. Prohably the engrafted cheetnute met the fate of all youug shoots when exposed to roving cattle.

But if the fine chestnnt of Japan givee euch a record, we may hope that the coffee tree of Guatemala will do equally well when grafted on our wild mountain coffee.

Smeltino Operatione.—A vieit to the old Mattison worke, now being put in order for running, sbows us that the projeotora of the scheme mean buainees and are determined to succeed in their enterprise. The middle etack or furnace is heing torn to pieces internally to allow new lining to be placed therein, and the varions adjuncts about the worke are in a decidedly forward etate of preparation. Coal and ore are being hauled to the place, and, when all is ready, sufficient will be on hand to gnarautee the fact of a long run. We place great reliance and faith on the auccessful working of this furnace enterpriae, and are satisfied that much benefit will acorue to the county generally from its working. Of couree it is not the object of the projectore to continue running the furnaces at the present location, the purpose being to demonstrate positively the fact that no difficulty exists in reducing our ores, when other and permanent operatione will be commenced. To the raault of this experiment we aball look forward with much anxiety, feeling aatisfied that on its success depends much of our future wealth and proeperity.—*White Pine News.*

Mine Draining Apparatus.

Meeers. Tangye Brothers, of Soho, are introducing new apparatue for draining minae, which ie rapidly euperceding all others in the Newcastle collieriee. It conaists of a steem pnmp placed at the bottom of the pit, and often far away in the workinge directly over the source of tha water which ie, by its operation, forced np a pipa to the pit mouth; tha hight to which the water may be raised being limited only by the etrength of the apparatus, and the eteam force eupplied hy the hoilar. The construction of Massrs. Tangye's eteam pump ie simplicity itself. The steam cylinder ie placed horizontally on a base plata in direct lina with the pump, and tha eame piston rod goee into both steam and pumping cylinders; thne, no fly-whael, crank or extraneous gaar of any kind is required, and the only moving part which can he seen is the piston-rod, as it paesee to and fro from one cylinder to the other. Each etroke of the pump has the affect at ona end of sucking water into tha apparatue, and at the other of foroing water, alraedy drawn np, into the discharge pipe, an air veesel being conveniantly situated so as to pravent concussion. The pair of pumps just completed, are of largar than nsual dimenaione. Tha eteam cylinders are of 32 inchae diamater, the pumping cylindere of seven inches diemeter, with a stroke of six feet, and the air vaesel is 18 feet high, with an internal diameter of 24 inchee. The pumps are hrase-lined, and hava four eaparata valves, fitted with multiple valvee, and the whola apparatus ie mountad upon maesive base platee. It ie intended to place theee pumps at the bottom of a pit 1,068 feet deap, and with 35 pounds prassure of eteam they will force to the surface 18,000 gallone of water par hour, in ona direct lift. The anginee ara so arranged that they can be both worked together, if their full capacity is required; or if the eupply of water ie at any time lees, eithar engine or pump can be easily ahut off, and tha othar only need ba worked. With regard to tha supply of steam power, the boiler can, if epace permit, ba placed in the working, close to tha pumping apparatus; but, if this should be found inconvenient, staam can be convayed by a pipe down the shaft, from the boiler at tha top.

Cortez and Bullion Distriots.—Tha Elko *Independent* has the following concerning a couple of the outlying districts of Eureka county: Tha Wenban mill of ten atamps at Cortez has just been pnt in thorough running order, the engine and boilera have been readjueted, and the roaating faoilitiee improved by tha conetruction of four new reverberatory furnacee. Tha camp is naw, and has baen for eoma tima past one of the moat prosperous in the State. The ora ohtained is of high grade, and plenty of it—the greater portion of which is coming from the Garrieon mine—and worka from $300 to $500 par ton. About 200 tons of this ore ara now at the mill, 200 tons lying at the dump, and plenty of the same eort in eight at the mine. Our old friend, Jamaa Laraway, still retains his poaition of Superintendent of the mill and minee, and dischargee tha dutiaa of the poeition with his ueual effectiveness. Wa have underatood that Jim hae soma good mines of hie own in that vicinity. We hopa he has, and that in good time he may reap the raward of patient induatry, as he daserves. At Bullion district, eome twenty milee west of Cortez, Campball, Yonng & Co. ara takiug from their minee large quantitiee of good ore, which they are sending to Cortez for reduction; but, as they have enough rock of their own to furniah the mill at that place, negotiations are pending between Campbell, Youug & Co. aud the Mineral Hill Co. for one of the mills at the latter place to be removed to Bullion. Lockwood, better known aa Lockte, of Mineral Hill, obtained a lease of one of the minee of Campbell & Co., and we underetand ie making it pay well. If the above company ie successful in its efforte to get a mill in operation at Bullion, this season, that district will eoon achieve a wide-spread notoriety.

Gold in Chunke.—In the Illinois gravel claims, at Moore's Flat, the workmen on Friday came acroes a howlder which had to be broken up before it could be run down the flume. One of the men partly completed the job before dinner. Wheu he went back to work he again commenced breaking up the rock, and diecovered it contained gold. The rock was finally hroken, and about 125 lbs. waa taken to the banking-houae of Marks & Co., where it was burned, and it ia eetimated that at least $2,500 in gold will be saved. Such bowldera aro frequently found in the mines of that vicinity. Two years ago three were found in succession, one of which had $678. One was found in Orleans Flat in 1859, which had $8,700 in it. One was found at Moore'a Flat eome time in 1860 which had $5,500. There was one found at Moore'e Flat last summer which had over $700 in it.—*Nevada City Transcript, July 15th.*

A. Big Cistern.—The foundation ie now being laid at the new Palace Hotel for the biggeet cietern in the world. There are upwards of a hundred men engaged laying the brick—more than a million in number. The foundation is laid in cement, and the engineer in charge says it will be one of the fineat pieces of engineering on thia continent. Its capacity is said to be eix million gallons.

A Venturesome Trip.—A Colorado man purposes to eoon attempt the trip from Puehlo to New Orleans, down the Arkansas and Mississippi, in a light canoe.

Good Health.

The Human Frame.

No. 7—The Brain.

In taking up this subject we enter upon a field wherein science has made but little progress. The brain, being undoubtedly the special organ and throne of the mind, will never be entirely understood until that mysterious link which binds the finite to the infinite shall have become acquainted with itself; and so, whenever the mind endeavors to analyze its own origin, powers or manner of action, it draws back awe-struck and dazed at the glimpses of that infinity which lies so thinly veiled and bewildering just beyond its limited horizon. It has been the subject of deep and searching investigation; and, apart from its connection with the mind, no organ is better understood. Taken from the skull of the human body, it presents a mass of a fatty structure so frail and delicate of organization that we almost wonder how it is preserved from injury or destruction, even among the ordinary occurrences of our every-day life; and well illustrates the steps by which matter becomes more and more refined as its connection with mind assumes a higher and closer relation. It is composed, as is well known, of a gray and a white substance, that are formed into a series of convolutions, the shape of which is familiar to all. Of these two, the gray is supposed to be the actual communicating link between the mind and its servant, the brain, while the white connects this with the coarser tissues. This gray matter is made up of tiny cells, which vary from one three-hundredth to one four-thousandth of an inch in diameter. The white substance, which forms by far the greater part, is composed of delicate filaments which are from one two-thousandth to one ten-thousandth of an inch in diameter. In the brain, the gray substance is spread mostly on the surface; its disposition in the nerves will be given when we take up that subject.

It would be interesting, did space permit, to trace the evolution of the brain from the lower forms of animal life up to that of man, but we can only give the shadow of an outline. It begins as a simple ganglion of nervous matter, and is situated near where it is needed, regardless of any "head." In the five-rayed star-fish, for instance, there is a ganglion at the base of each limb, so that this familiar little fish has the advantage over mankind of possessing five distinct brains. A step higher, and one of these ganglia begins to assume a greater size than the others, and the animal begins to show signs of a centralization of intellect, or in other words a head is added to its organization. This step is illustrated by some of the molluscs and articulata, as the *Aplysia* and centipede. Higher yet, and this centralization begins to develop different convolutions, having different offices; and it is from a hair-splitting, unscientific application of this principle that the so-called "science" of Phrenology sprung, which now so delights the souls of ignorant quacks and pretended "delinentors of character!" This step is illustrated in the vertebrata, and culminates in man; where matter has progressed so far that it is capable of union with intelligent, reasoning mind.

As a general rule, the size of the brain is in proportion to the intellect of the individual. In the male the average weight is about 49¼ ounces, in the female 44 ounces. Cuvier's brain weighed rather more than 64 ounces, that of Dr. Abercrombie 63 ounces, and that of Dupuytren 62½ ounces. On the other hand, the brain of an idiot seldom weighs over 23 ounces. The human brain is heavier than that of all the lower animals, except the elephant and whale. The brain of the former weighs from 8 to 10 lbs., and that of the whale, in a specimen 75 feet long, weighed rather more than five pounds.

It can sustain severe inflammations and injuries to its substance; some of the most remarkable recoveries from injuries in the annals of surgery being those of the brain. Of these, the most famous occurred several years since, in this State. It is that of the miner who, by a premature discharge of a blast, had a "tamping iron" over two feet long and an inch in diameter driven entirely through his skull from below upwards, and who, strange to say, recovered and lived several years after the accident. His skull is now in a museum at Boston where it is kept as a curiosity to show the fearful apertures made through it by the iron as it entered and made its exit.

Poisoning by Carbolic Acid.—A patient in a hospital, through mistake of the attendent, took a tablespoonful of a solution of one part of carbolic acid and six parts of water, instead of an infusion of senna. A burning sensation in the throat, vomiting, and contraction of the pupils of the eyes ensued. As soon as medical aid was at hand, the stomach was cleansed three times with water, by the aid of the pump. Still the patient suffered severe pain, and became insensible to light. The pulse became rapid. A cold, clammy sweat, deep sleep, and finally death ensued. A post-mortem examination of the contents of the stomach, of the liver, the heart and venous blood, and of the urine was made. No carbolic acid was detected except in the stomach, from which it was inferred, either that the acid had not been diffused through the system, or that it had been diffused in so small quantity as to escape detection.—*Amer. Chemist.*

Cheese as Food.

The *Live Stock Journal* has some interesting analyses of this article of food, with deductions founded thereon, from which we obtain the following abstract: It will be seen if we compare lean beef, or lean mutton, or lean poultry, with skim-milk cheese, that one pound of this cheese is equal in supplying muscular force to one and three-fourths pounds of beef or mutton, and one and a half pounds of poultry; is superior in fat or heat-producing power, and has more than double the nutriment per pound. And a comparison of whole-milk cheese with fat beef, mutton, or pork, shows it more than twice as rich in muscular force, and not inferior, except to pork, in heat or fat-producing qualities. It is more than twice as valuable per weight as eggs.

Comparing it with the farinaceous grains, cheese is seen to contain two and a half times as much muscle-forming food as either wheat flour, rye meal, Indian meal, barley meal, oatmeal, rice or potatoes. But when we compare the carbonaceous matter of these grains (starch, sugar and fat) with cheese, they may appear to have the advantage. But one pound of fat is reckoned by physiologists equal to two and one-half pounds of starch or sugar as food; and thus the fat in cheese, instead of being represented by 27.50, would be represented by 68.75, making it equal to the starch in wheat flour. And here the dietetic philosopher will perceive the true use of animal and concentrated food. There is no source from which we may derive the carbonaceous elements of human food as cheaply as from the farinaceous grains. Many of these are relatively deficient in the nitrogenous elements—giving muscular force and power. They are also less easily digested than animal food and produce their results more slowly; but when properly mingled with more nitrogenous food, such as milk, cheese, beef, mutton, fish and other flesh, they form a diet leaving nothing to be desired in respect to health or agreement with taste. A small quantity of cheese taken with farinaceous food would make a proper balance of constituents to build and sustain all parts of the system. Less than half as much cheese would be required as beef, or mutton or eggs.

Cheese, therefore, among the foods easily obtained, appears, chemically, to be the most energetic in sustaining the vital force of the human system.

Liebig well says: "There is a law of nature which regulates these things, and it is the elevated mission of science to bring this law home to our minds; it is her duty to show why man and animals require such admixture in the constituents of their food for the support of the vital functions, and what the influences are which determine, in accordance with natural law, changes in the admixture. The young animal receives in the form of casein (cheese) the chief constituent of the mother's blood. To convert casein into blood, no foreign substance is required; and in the conversion of the mother's blood into casein, no elements of the constituents of blood have been separated. When chemically examined, casein is found to contain a much larger proportion of the earth of bones than does blood, and that in a very soluble form, capable of reaching every part of the body. Thus even in the earliest period of life, the development of the organs in which vitality is, in the carnivorous animal, depends on the supply of a substance identical in organic composition with the chief constituent of its blood."

Training of Boat Rowers.—An exchange says: "At some of the colleges the training of the racing crews is about as follows: In the morning an easy walk of an hour's length, at noon a quicker walk of half an hour, and in the afternoon a pull of seven or eight miles, after which comes a bath and a good rubbing down. The system of diet is rather one of proscription than prescription. Certain articles well known to be unwholesome are proscribed. Other things may be eaten. Pastry, tobacco, coffee, pork, and all stimulants are ruled out. The crew pulls a plain forward and back stroke, with no special attention to style or scientific points, making generally 32 strokes to the minute." To this we may add, that a crew trained in the manner described would have small chance of winning a race, at least against a crew in perfect condition. The rowing is now nearly always divided into two parts, morning and afternoon, and made so light as never to tire the men—a most important point, according to new-school theory and practice. The diet is but little restricted. But a crew which pulls a "plain forward and back stroke, with no special pretension to style," is always at a disadvantage when pitted against those who know how to make the best use of their strength. There is a prevailing impression that "style," as it is termed, is merely for show; the truth is that a well-trained crew does not waste an inch of movement nor a particle of muscle, but simply rows in the manner which experience has taught is the most effective. Sheer strength may sometimes win a single scull race; but a truly successful crew is one which rows with precision.

"Preventive medicine," says Dr. Henry Bowditch, in an admirable and exhaustive paper on the subject, "is the natural outgrowth of modern thought and resources, stimulated by centuries of suffering and by the sacrifice of multitudes of human beings."

Useful Information.

Spontaneous Combustion.

In a paper on the "Ignition of Cotton by Saturation with Fatty Oils," Mr. Galletly communicates some information confirmatory of the generally received popular opinion regarding the spontaneous kindling of cotton and other open combustible substances which may happen to have imbibed animal or vegetable fatty oils. The apparatus employed consisted simply of a box, in which the cotton saturated with the oily substances was placed, and the temperature then gradually raised in some cases to 130 deg. Fah., the temperature which a body acquires by lying exposed to the vertical rays of the sun; and in others to 170 deg. Fah., about the heat attained in the neighborhood of a steam-pipe, a heated flue, or in front of an open fire. With boiled linseed oil the author found that shortly after the material had reached the temperature of his warm chamber, 170 deg., the thermometer began to rise—from 5 deg. to 10 deg. every few minutes—so that in 75 minutes from the time the box was placed in the chamber, the heat indicated was 350 deg. Fah. At this point, smoke issuing from the box indicated that the cotton was in a state of active combustion; and on returning it to the free access of the air, it burst into flames. In another similar experiment, the temperature rose more slowly, but reached 280 deg. Fah. in 105 minutes, when, from the appearance of smoke, it was plain that the cotton was burning; and the whole mass was soon in a flame on being placed in a current of air. Raw linseed oil was found not to cause ignition of cotton so readily as the boiled oil, but under conditions similar to those of the above described experiments, active combustion was going on in one case in four, and in another five hours. With rape oil under the conditions of the first experiment, the result was that the box and contents were found in ashes in ten hours—the box being put up at night, the result was only observed in the morning. Olive oil caused active combustion within five or six hours. With castor oil the contents only charred on the second day of the experiment. Lard oil, specific gravity .916, produced rapid combustion in four hours. Seal oil, specific gravity .928, the same result in 100 minutes. Sperm oil gave negative results. The author, as the result of his work, advances the opinion, from a comparison of raw linseed with lard and seal oils, that the statement is not altogether correct that "drying oils are more liable to spontaneous combustion than non-drying oils; and that the rate at which oxidation takes place does not depend chiefly on the presence of small quantities of putrifiable matters, but rather upon the particular olein or liquid fat they contain." The results of the experimental trials are stated to have been remarkably uniform. The author states that the ignition of cotton can be calculated on for any oil with the same certainty as the point at which sulphur or other combustible matter inflames in air. The heavy oils from coal and shale were found to effectually check the phenomenon above described; for when mixed with the oils above named they gave no indications of heating whatever at 170 deg. Fah.

Preservation of Timber.—Various recipes for this purpose have at different times been given, such as saturating the wood with metallic salts, coating with linseed oil and charcoal, charring, etc. When carefully applied to timber that has previously been properly prepared, these plans answer very well; but in the hands of ordinary builders, farmers and householders, they fail in nine cases out of ten, the objects to which they are chiefly applied being posts sunk in the ground. To such objects the old system of charring is frequently applied, but does not always prove effective, especially where the wood is saturated with sap. It has been found, however, that if posts be slightly charred on the surface, and then coated with hot coal-tar, they will not decay for many years. The tar must be hot, and applied to the freshly charred hot timber, otherwise it will not penetrate the pores, and failure will be the result. Merely charring a stick of wood, or painting it with coal-tar, will not preserve it; but when the two are combined, as we have directed, posts seem to last indefinitely.—*Industrial Monthly.*

The *Cultivator* gives the following recipe for making fire and water-proof paint: Slack stone lime by putting into a tub, covered to keep in the steam; when slacked, pass the powder through a fine sieve, and to every six quarts add a quart of rock salt and a gallon of water; then boil and skim clear; to every five gallons of the liquid add pulverized alum one pound, pulverized copperas half pound, and stir slowly; add powdered potash, three-quarters of a pound, then very fine sand or hickory ashes, four pounds; then use any coloring matter desired, and apply with a brush. It looks better than any ordinary paint, and is durable as slate; will stop small leaks in roofs, prevent moss for growing thereon, make it incombustible and render brick impervious to water.

Starch.—Correspondents ask what is put in starch to give the shirt bosoms a gloss. A piece of paraffin or white wax, about the size of a hickory nut, in each bowl of starch. The managers of one large shirt factory, however, assure us that they produce the polish by the skillful use of the sad iron only.—*Sci. Am.*

Zincing Iron.

The following is an excellent and cheap method for protecting from rust iron articles exposed to the atmosphere: They are to be first cleansed by placing them in open wooden vessels, in water containing three-fourths to one per cent. of common sulphuric acid, and allowed to remain in it until the surface appears clean, or may be rendered so by scouring with a rag or wet sand. According to the amount of acid, this may require from six to twenty-four hours. Fresh acid must be added according to the extent of use and of the liquid; when this is saturated with sulphate of iron, it must be renewed. After removal from this bath, the articles are rinsed in fresh water, and scoured until they acquire a clean metallic surface, and then kept in water in which a little slaked lime has been stirred, until the next operation. When thus freed from rust, they are to be coated with a thin film of zinc, while cold, by means of chloride of zinc, which may be made by filling a glazed earthen vessel, of about two-thirds gallons capacity, three-fourths full of muriatic acid, and adding zinc clippings until effervescence ceases. The liquid is then to be turned off from the undissolved zinc, and preserved in a glass vessel. For use, it is poured into a sheet-zinc vessel, of suitable size and shape for the objects, and about 1.30 per cent. of its weight of finely-powdered sal ammoniac added. The articles are then immersed in it, a scum of fine bubbles forming on the surface in from one to two minutes, indicative of the completion of the operation. The articles are next drained, so that the excess may flow back into the vessel. The iron articles thus coated with a fine film of zinc are placed on clean sheet-iron, heated from beneath, and perfectly dried, and then dipped piece by piece, by means of tongs, into very hot (though not glowing) molten zinc, for a short time, until they acquire the temperature of the zinc. They are then removed and beaten, to cause the excess of zinc to fall off. —*Technologist.*

Water-proofing Leather.—Two recipes are given in the *Artisan*: 1. Melt together beef tallow four ounces, rosin one ounce, and beeswax one ounce, and when nearly cooled solid add as much neat's-foot oil as the above mixture measures. It is to be applied with a soft rag to both soles and uppers. The leather should be warmed meanwhile before a fire, and the application well rubbed in. It requires two applications to make the leather thoroughly water-proof. 2. Dissolve three-quarters of an ounce of paraffine in a pint of lard oil. The best quality of oil should be used. It will be necessary to heat the oil in order to dissolve the paraffine. This solution may be rubbed on boots once a month, and it is said to render them perfectly water-tight, at the same time that it does not interfere with the blacking. If the solution is found to make the leather too stiff the amount of paraffine in proportion to the oil should be reduced.

To Polish Brass.—Rub the metal with rotten-stone and sweet oil, then rub off with a piece of cotton flannel, and polish with soft leather. A solution of oxalic acid rubbed over tarnished brass soon removes the tarnish, rendering the metal bright. The acid must be washed off with water, and the brass rubbed with whiting and soft leather. A mixture of muriatic acid and alum dissolved in water imparts a golden color to brass articles that are steeped in it for a few seconds.—*Jour. of Chemistry.*

The following composition is highly recommended as a varnish for wicker-work: One part of good linseed oil is boiled down to a syrupy consistence, and mixed with 20 parts of copal, or some other rich lac. This mass is then diluted with oil of turpentine to the proper thickness. The varnish dries easily, and remains sufficiently elastic to stand, without cracking, the bending of the baskets, etc.

Wax for Floors.—Heat 5 ounces of pearl-ash, 25 ounces of wax, and 20 ounces of water together, stirring it frequently until a thick mass results, from which water does not separate on standing a short time. Then add from a pint to a pint and a half of boiling water, with constant stirring. This may be colored if desired. It may be applied with a woolen rag, and thoroughly rubbed in.

A fibrous bark of the sugar'palm proves to be a good substitute for bristles and animal and human hair. The treatment is simple. The bark is first immersed in water and boiled for some time in an alkaline solution; the fibers are then soaked in an emulsion of fat, alkali and water for about twelve hours, after which time they are sufficiently hard and elastic for the above-named use.

Coloring Veneers.—Raw veneers become soft and leathery after soaking for half an hour in a ten per cent. solution of caustic soda, and thorough washing; the color is then applied, and penetrates throughout the whole. After the staining is completed, the veneers must be dried between paste-boards.

Carbolic acid will arrest mouldiness and decomposition in hides, tanning liquors, etc. When applied to leather, not only is no injury done, but even improvement in the quality results, the leather becoming more soft and supple.

Saturday Morning, July 25, 1874.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Patent "Buffalo" Carriage for Burleigh Drills; Uses and Benefits of Industrial Fairs; Ready Relief Mine, 49. Beach Mining on our Gold Coast; Why We Should Exhibit; Shoes and Dies from the California Magnetites; Exhibit of Machinery at the Fair, 56. The Shaker Sash Balance; Sonorons Sand; Academy of Sciences; Commencement at Oakland, 57. Invention and Progress; Patents and Inventions, 60.

ILLUSTRATIONS.—Patent "Buffalo" Carriage for Burleigh Drills, 49. The Shaker Sash Balance, 57.

SCIENTIFIC PROGRESS.—Velocity of Nervons Impulses; Photography at the Bottom of the Sea; Men of Science; Temperature of the Earth; Detection of Phosphorus; Evolution of Gases from Molten Cast-Iron, 51.

MECHANICAL PROGRESS.—Watches; New Mechanical Cutter out; Paper from Jute; Testing Armor Plates; A Compound Locomotive; Liquefying Gases; Hollow Bars for Furnaces; Improved Fish-Grappling Spear, 51.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 52.

MINING SUMMARY from various counties in California and Nevada, 52-3.

GOOD HEALTH.—The Human Frame—No. 7; Poisoning by Carbolic Acid; Cheese as Food; Training of Boat Rowers, 55.

USEFUL INFORMATION.—Spontaneous Combustion; Preservation of Timber; Starch; Zincing Iron; Waterproofing Leather; To Polish Brass; Wax for Floors; Coloring Veneers, 55.

MISCELLANEOUS.—The Globe Consolidated Mine; Pioche Mines; New Mexican Mines; Eureka Mines; California Microscopical Society; Sierra County Mines; Ruby Hill Water Works, 50. Resources of Nevada; Straw-Burning Engines; Tyho District; How About Silk Cultnre? Plucky but Prudent: The Rattlesnake Quicksilver Mine; Wild Coffee; Smelting Operations; Mine Draining Apparatus; Cortez and Bullion Districts; Gold in Chunks; A Big Cistern; A Venturesome Trip, 54. Montana Silver Mines; Original Gold Hill Quartz Mining Company; Machinists in the Navy; The Oil Regions of Los Angeles; The Pine Belt Quicksilver Mines; Great Gravel Mining Field; Coal Mining in China; Panamint, 58.

STICKEEN MINES.—The steamer *California* arrived at Portland from Sitka on Sunday evening. She brought eighty miners from Wrangel, and two hundred more were expected there daily, on their way home. They bring discouraging news. The rush has been too great for the small number of paying claims discovered. A correspondent writing from there to the *Call* states that many men are leaving every day, while others are constantly arriving. Those going out have been forced to do so, by reason of a lack of means to procure provisions until the season opens, and will naturally tell hard stories about these mines; but many with whom he has conversed say they intend coming back in about a month, if they can procure provisions at the landing. The country has been very much overrated, and unless other diggings are struck this season, will not be of a capacity for more than two thousand men.

ORE SHIPMENTS.—According to the *Bulletin's* half yearly commercial statistics the following ores were shipped by sea from this city for the six months ending June 30th: To New York (copper) 214 tons, worth $12,840; to New York (various) 174 tons, worth $6,170; to Great Britain (copper) 74 tons, worth $7,966; silver 32 tons, worth $4,000; and 614 tons of manganese, worth $9,539. To other countries we shipped one ton of copper ore worth $400 and two tons of silver ore worth $1,200. This makes a total shipment of 1,111 tons, valued at $42,115.

DR. SHREWSBURY and party, of Santa Barbara, last week discovered a very rich lode of cinnabar on Canada los Osos, in the Santa Inez mountains, about twenty-five miles by road from Santa Barbara.

TYBO.—It is rumored that a party of prospectors have recently struck rich mines in the neighborhood of Tybo. The exact location is kept secret until the discoverers have taken up the ground they want.

THE Arizona papers are filled with accounts of rich strikes in new and old mines, and of gold, silver and copper bullion received at Yuma and Tucson.

THE two Riotte and Luckhardt furnaces, being put up on the Borax company's property, are of 40 tons capacity.

Beach Mining along our Gold Coast.

Beach mining, after an active period, occurring some twenty years ago, when the cream of these deposits was rudely skimmed off by those in the field, has been sensibly revived within the past year owing to the favorable results obtained through the use of improved processes and machinery. It was generally supposed until within a few years ago, that the greater portion of the gold contained in these beach sands was saved by the sluices, copper plates, etc., then in use. But thousands of assays and other tests have since proved that in most cases fully four-fifths of this gold is invisible to the naked eye and was lost in all former workings. When this fact became established, interested parties set to work to

Solve the Problem,

How to separate these infinitesimal particles of gold from the heavy black sand with which they are associated. And it proved to be one of the most difficult things to accomplish that has yet puzzled the brains of scientific men or honest miners. The extreme lightness of the minute particles of gold and the great weight of the grains of black sand rendered any process of concentration or amalgamation, based upon their relative specific gravity, impracticable; and another serious obstacle was encountered in the existence of a coating or oxidation upon the surface of these tiny, microscopic specks of gold, which prevented amalgamation. Many thousands of dollars were spent in making tests and experiments to obtain an economical method of working. Chlorination and other chemical modes of treatment were found to be too expensive, but they confirmed the assays, showing

The Extraordinary Richness of the Sands.

And stimulated those interested to further efforts to overcome all obstacles. A vast amount of this sand was proven to contain from $10 to $30 per ton, and results were frequently obtained showing several times these values. The most extensive of these deposits yet developed are located at Randolph, Coos Co., Oregon, where the claims of Messrs. Lockhart & Lane are known to contain several millions of tons of black sand worth from $5 to $100 per ton, or an average say of $15 to $20 per ton, leaving enormous profits for working by a process not costing more than $3 per ton. The cost of mining the sand is merely nominal in most cases. Plenty of similar deposits, though of less extent, exist at various localities along the coast from Humboldt bay to the Columbia river, and in fact

Extending North to Alaska.

The most extensive deposits are those of the ancient ocean beaches, formed before the late upheavals of the coast line, and lying back of and above the present ocean beach. But there are immense quantities of rich sand upon the present beach also, that will be worked at great profit, as they are more accessible and easier mined. Indeed, the quantity of black sand in these beach deposits, ancient and modern, carrying from five dollars to ten dollars per ton, may be considered almost inexhaustible. But these placers have lain for many years almost unnoticed and unworked for want of a process and machinery that would save this fine, flour gold. So many have had their wits at work upon the problem within the last two years that

Perseverance has at Length been Rewarded by Success,

And a new branch of mining industry developed which is of far greater magnitude and importance than the public or even the mining portion of the community are aware of. This microscopic or "flour" gold exists in large quantities in all our gravel and placer diggings, as well as in the tailings of our quartz mills, and is lost to a great extent as mining operations are now conducted. The successful treatment of the black sand of the ocean beach is much more difficult than of any other class of auriferous deposits, and hence the process which overcomes such obstacles will easily conquer those involved in ordinary placer mining, and millions of dollars, now lost annually, will hereafter be saved by the new treatment. The great difficulty experienced in saving these infinitesimal particles of gold arises from the fact that they are so light that the current of water employed in ordinary mining operations carries them off; their gravity not being sufficient to overcome the force of the current. This has been obviated by effecting amalgamation before subjecting the sands or pulp to a stream of water, which result is secured by

Evaporating the Quicksilver Under Water.

Heating the sand or pulp containing a proper quantity of quicksilver with plenty of water, up to the boiling point, causes the mercury to expand and diffuse itself all through the mass in minute globules which unite with the fine particles of gold, provided the latter are in a proper condition to amalgamate. The heating aids to remove the coating upon the gold, but to effect a thorough preparation for amalgamation the sand is first subjected for some hours to a chemical preparation which is not expensive, though very powerful. The next and final difficulty to be overcome, is to collect the fine particles of amalgam (some of which are still too fine to be visible to the naked eye) together, after the boiling, without too great a loss. The loss of quicksilver by the mills in Washoe averages about one and a-half pounds per ton of ore, while a loss of as many ounces in working black sand would leave little or no profit to the miner; because, being amalgam, the loss *in gold* would be too great.

The Perseverance Black Sand Mining Co., Recently incorporated in this city, has succeeded, after spending more than a year's time and several thousand dollars, in perfecting a machine for separating these fine particles of quicksilver or amalgam from the heavy black sand without material loss, and at a trifling expense. This company is about to commence operations on a large scale with the new process and machinery upon their claims near the mouth of Rogue river, where they have secured extensive deposits of these sands, as rich as any on the coast. Through the aid of this improvement it is thought a new era will be introduced into mining, by saving at least ninety per cent. of the microscopic gold hitherto lost through the imperfect processes and machinery in use. The ordinary black sands, as stated above, contain from $5 to $15 per ton; and many deposits, containing thousands of tons, run up to twice and even three times these figures. The cost of working by the new method will be from $2 to $3 per ton, including mining, which in most cases is merely nominal.

Operations similar to those of the Perseverance company are soon to be started on the Lockhart claim, near Randolph, by Mr. John Bray, who has been experimenting on the sand with flattering success. The owner of that claim it now in this city making preparations for the necessary machinery, which is to be forwarded to the mine and set to work as soon as possible.

As a field for mining, this northern gold coast presents some

Peculiar Advantages for Men of Small Means.

In the first place, it is easily and cheaply accessible; then, no great amount of capital is required for out-fitting purposes; while again, there is not much trouble in securing claims for working, the chances of taking up ground or buying from former locators being good at most points along the coast.

At one time there was an effort made to take up the strip of ocean beach between the line of high and low water, under the law of Congress granting to the State all swamp and overflowed lands between its borders. But the Surveyor-General, acting under advice from the Commissioner of the General Land Office, decided that ocean beach did not come within the purview of that law, which was designed to cover only the overflowed grounds along our bays and other inland waters. This places these modern sea beaches, wherever found to be auriferous, among other mineral lands belonging to the public domain. Hence they are open to location by the miners, who may occupy and hold them under such local regulations as they may themselves see fit to adopt, so long as these conform to the statutes enacted by the general and State governments.

Why We Should Exhibit.

None but a very few lukewarm citizens have probably asked themselves this question, and probably the only reason any of them have done so is because they thought the outlay would amount to more than they could afford. Fairs and exhibitions of all kinds are, however, the very best means of advertising, and the expense attendant on preparing a suitable display is very small compared with the benefits derived. It should be recollected also that the prosperity of the city and State may be very well measured by the character and extent of the proposed exhibition of the Mechanics' Institute. If visitors see a meager and ill-conditioned display they naturally connect it with want of prosperity among the manufacturers and artisans; and as this class of citizens are generally dependent on the prosperity of the State, they should make every effort to demonstrate the fact that our affairs are prosperous.

If one firm displays a certain class of goods or merchandise, and there are no others of that class in the Fair, the public naturally supposes that this firm does the largest business in that class of goods or merchandise, and afterwards if they are mentioned it will be remembered that such a display was made by such a firm, and no one could compete with them. If there are several firms which display articles of a similar character, the public visiting the Fair will take the opportunity to inform itself of the comparative merits of the articles, and in this will be influenced, to a great extent by the taste with which the articles are exhibited.

No business man could desire a better advertisement than will be afforded him at the approaching Fair. He shows articles in his line in a place where more people will see them in one day than would see them in a year in the store. He shows them in an attractive form before the very people to whom he desires to sell, and they examine them at a time when they have more leisure than they have during business hours. This is an opportunity which no business can afford to lose. The Mechanics' Institute afford a fine building and space free to all, and what is more, provide an audience daily and nightly for a month in succession, such as would be brought together in this city by no other means. These are only a few reasons "why we should exhibit?" but looking at the Exhibition from a business point of view, they are cogent ones.

Shoes and Dies from the California Magnetites.

It has been said that a nation's advancement in civilization is in ratio to the quantity of iron consumed. Notwithstanding the enormous quantity used, the demand is increasing, particularly on this coast. The estimated cost of the yearly consumption of iron here is $9,000,000, all imported. This is a very important item against us on the balance sheet of trade. There are plenty of valuable deposits of iron ore in this State, but want of proper fuel, flux, etc., has prevented them from being worked; nevertheless, there are certain of these deposits which ought be made available if our capitalists would interest themselves in the matter. In this connection we may introduce the following letter, received by us from J. S. S., of Railroad Flat, Calaveras county, California:

"The iron deposits of Calaveras county alone are sufficient to supply the nation for generations to come. In this vicinity there is a vein of magnetic iron ore, varying from five to thirty feet in width, that assays from fifty to seventy-two per cent. in pure iron; in a locality where timber, limestone and soapstone are abundant; also, excellent water-power privileges; in fact, every facility for the manufacture of iron.

"It is false economy to continue the importation of iron, and export our precious metals in exchange. To illustrate the absurdity of this state of things.—A quartz mill is being built in this vicinity within a few rods of an immense deposit of iron ore, almost pure enough for the shoes and dies, for the batteries of the mill; yet imported iron is used in the construction at a cost of five to nine cents per pound.

"If a portion of the money that is being spent in remote localities, by our capitalists, in developing uncertain prospects for gold and silver, was directed toward developing the iron mines at home, they would undoubtedly receive better returns on their investments. But 'distance lends enchantment to the view,' consequently the periodical begiss of miners to the frozen regions of the north, and to the hot deserts of the south, in search of new El Dorados, where fortunes are often lost but seldom won, will continue."

There is a difference of opinion as to whether these iron deposits could be worked with profit on a large scale. Be that as it may, our attention was called by the above letter to a matter of some importance to our mining population, and which may, at the same time, add another industry to our home manufactures. That is, that shoes, dies, picks and other mining tools ought to be made from the California magnetites. From inquiries we have made, we are sure that small establishments with a small capital will be profitable, and will have a certainty of success. We will enter more into the details of this subject in our next issue.

The Exhibit of Machinery at the Fair.

The iron foundries of this city will probably make as fine a display at the Mechanics' Institute Fair as that of any other branch of industry in our midst. People generally take a great interest in machinery in this country, and the machinery department, though not a favorite place with the ladies, proves the center of attraction for the more intelligent of the male part of the community. As power is furnished free, all sorts of machinery can be shown in working order, and our foundrymen will, no doubt, take advantage of this free opportunity of displaying the results of their skill.

The machinery is to be run by a fine engine, made in this city for the Palace Hotel, now in course of construction. The firm that manufactures this engine propose displaying seventeen engines of different sizes and classes, all made in this city. The large engine to drive the machinery is a powerful one, as it needs to be to drive even the pumps alone, if the Exhibition in that line bears proportion to previous years. It is very handsomely finished, and is quite ornamental as well as useful.

The foundrymen of this city supply our whole coast with all classes of machinery, and are accustomed to receive orders for everything in their line, from a key-bolt up to a 60-stamp mill or a compound engine. The class of work is, therefore, not restricted, and the display ought to be both varied and large in case they choose to exert themselves. In mining machinery, in particular, they excel all other parts of the world, and it is to be hoped that some one of them, at least, will show the city public a quartz mill, engine, battery, and all complete. When visitors show signs of being too aesthetic in their tastes they can be drawn from the art gallery and the music to consideration of matters of more utility, by simply starting up the stamps, which will most effectually drown sounds of the band, and even that of the everlasting piano themselves.

CHINESE MINERS.—Some five or six wagons, loaded with Chinamen and their traps, have left the Dalles during the last ten days, bound for the interior gold mines. One load was taken up the Columbia river to the month of the John Day, where they intend mining on a bar near that locality.

WORK on the Brownlie quicksilver mine, near Vallejo, is progressing favorably. About fifteen or twenty men are employed, and one tunnel is now in two hundred feet.

The Shaker Sash Balance.

The importance of well ventilated rooms is recognized by every family and individnal, who believe pure fresh air indispensable to good health. In modern-built honses the means of ventilation are principally fonnd in the doors and windows, msinly the latter. The method of adjasting windows by side weights is costly and inconvenient, especially when old-fashioned wiadows are replaced by the new. In that case the wholo casement must be torn away and rearranged to give space for cords and weights. Moreover, when the cords wear out and need changing, it is necessary to remove part of the casement in order to get at the weight, pulley and cord. Mr. J. S. Russell, of South Union, Ky., has invented a device to do away with the objectionable features of the old style arrangement, a cut of which is shown on this page.

A cord, Fig. 1, is attached to tho center of the npper sash by passing it, from beaeath, upwards through a hole bored to fit, and making it fast by a wedge driven in from on top, and then over a pulley adjusted as represented in the upper part of the window frame. The cnds extend down throngh the apparatus, *A*, which, shown in detail in Fig. 2, forms the essential portion of the device. It consists simply in two eccntrics, *B*, aecured in a suitably ornamented metal caso, and fastened to the npper part of the lower sash. It needs no explanation to show that one sash counterpoises the other, so that by a mere tonch of the finger each may be rnised or lowered to any given diatance. If, however, it be desired to move but one, nnd that the top sash, the operation is rendily accomplished by drawing the cord to the right or left, which relieves the grip of the eccentrics. On straightening the line, the latter immediately resnme their claep and hold the sash in any position. To raise the lower sash, it is only necessary to hold the cord firmly and lift the sash with the hand, when it will remain as placed.

This device does away with the use of the nsual cords and pulleys on windows, by making one sash balance the other. It is cheap, readily applied, and will afford all the means for ventilating that side weights do. The sash is easily adjnsted by drawing the cord to right or left, which relieves the grip on the cord. You then have entire control of the sash. To adjust either top or bottom sneh at will strnighten the cord and the eccentrics immediately clesp and hold the sash. The fixtures are easily detached for washing windows, painting, atc. W. J. McGowan, South Union, Kentucky, may be addressed for fnrther information on this snbject.

Sonorous Sand.

A speciman of this cnrious substance, taken from a hank ou the island of Kauni, of the Hawaiian gronp, was presented by W. R. Frink, of Honolulu, to the Cahfornia Acadeiny of Sciences at the lnst meeting. The following interesting description of its peculisrity was contaiaed in a letter from the donor: The baak, which is composed of this sand, commences at a perpendicular bluff at the soatbwest end of the islnnd, and extends one and a half miles slmost due south, parallel with the beach, which is about 100 yards distant from the base of the aand-bank. Thia sand-drift ia about 60 feet high, and nt the axtreme aouth end the angle preaerved ia as steep as tha natnre of the aand will permit. The bank is constantly extending to the south. It is said by the natives that at the bluff and along the middle of the bank tho sand is not sonorous. But nt the extreme sonth end and for half a milé north if you slap two handfala together there is a sound prodnced lika the low hooting of an owl—more or less sharp, according as the motion is quick or slow. Sit down npon tha sand and give one hand a qnick circnlar motion, and the sound is like the heavy basa of a melodeon. Kneel npon the steep incline, extend the two hnnds and clasp aa mnch sand as possible, slide rapidly down, carrying all tha aand you can, and the aound accumulates as you descend until it ia liko diatant thunder. In this experiment tbe sound was aufficient to frighten onr horses, fastened a short distance from the base of the drift.

But the greatest sound we produced was by having one native lie npon his belly and another taking him by the feet and dragging him rapidly down the incline, carrying as much sand ae possible with them. With this experiment the aound was terrific, and conld have been heard many hundred yarda distant. With all the experiments that were made, it seemed the aonnd was in proportion to the nmount of sand pnt in motion with a proportionate velocity. Another consideration seems requisite—that is, its perfect dryness. The dry sand wonld sound on the anrface, where six inches beneath it waa wet; bnt if any of the wet saud beoame mingled with the dry, ita property of aoanding ceased at once. The sand appears to the eye like ordinary beach aand, bnt ordinary beach aand will not prodnce the sounds. It hna been said that it lost its aonorons propertiea when taken away from the bank. But I can discover no diminishing of ita sonorous qnnlities, even with the bottle uncorked, and we have had rain frequently, and an atmoaphere more than ordinarily moist for thia tima of year. Perhaps if exposed to a very damp atmosphere it might absorb moiature enough to prevent its aonnding.

Academy of Sciences.

The regnlar semi-monthly meetiag of the California Academy of Sciences was held on Monday evening last, Professor Davidson presiding. Mr. E. Stevens was elected n resident member. Amoag the donations to the museum were the following: From J. S. Lawson of the Coast Survey, specimens of *Verillia Blakei*, preserved in glycerine in a heavy glass tnbe, the gift of Professor Davidson.

From John Williamson, Secretary of the Acclimatization Society, a collection of fish, embracing eight speciea, from Lake Tahoe. There are ten varieties of fish found in the lake.

From E. Stevens, fonr specimens of iron ore and one of fossil earth, from the Snblotte mines, Del Norte county, ten miles northeast of Crescent City. The fossil earth occnrs in great beds, at about 2,000 feet altitude.

From W. R. Frink, a bottle of sonorous sand from tho island of Kauai, accompanied with a letter describing its cnrious qnalities—referred to in another column.

From Eugene Gillespie, of Cape St. Lucas, through Mr. Dameron, a hox of the leaves and berries of a plant said to be poisonous. Accompanying the specimen was a letter describing the plant and the symptoms exhibited by a child whose death was caused by contact with or eating the berries of the shrnb.

The Alaska Commercial Co. presented a skeleton of a large Alaska seal.

The additions to the library were qnite extensive, including a large case of books from the Smithaonian Institute and 100 volumes from Senator Cole.

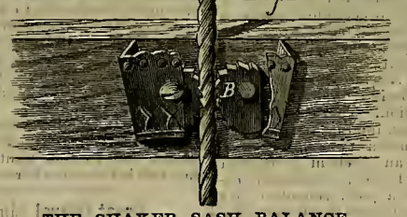
The Pacific Cable.

Professor Davidson communicated to tha Academy the general results of the recent survey made by Commander Belknap, of the United States steamer *Tuscarora*, on the proposed aouthern route for the telegraph cable from thia coast to Japan. The Professor's remarks were illnstrated with elaborate charts and drawings, bearing records and computations that repreaented an immense amonnt of labor. In the sonndinga from San Francisco to San Diego a great many off-shore linea were run Ninety miles off Point San Lnis the depth increaaed to 2,000 fathoms, with gray, greenish ooze at the bottom, and a temperature of n little over 32 degroes. Off Cape Mendocino a platean waa fonnd, with a depth of 2,500 fathoms. Off San Nicolas, at the distance of 33 or 44 miles, the depth was 2,000 fathoms. Down the Californin coast the ooze became greenish nntil San Diego waa approached, and on the platean off there a greeniah, yellowish ooze was obtained. Thence across to Honolulu the ooze was yellowish, then yellowish brown, nnd finally brown near Honolulu. In all casea the signs of former life brought up were those obtained on the Northern Pacific Coast.

To Honolulu the distauce is 2,200 miles. The bottom averages 2,565 fathoma in depth, or 15,510 feet, and the average temperatnre is 33 6-10 deg. Mnch more than one-half of this water along the ocean-bed has a temperature of 35 degs. only; above this came a stratnm of water heated to 40 degs., and above this again, water heated to 50 degs. Upon a calcnlation of the volume of water between this coast and Honolulu, along the line of sonndinga, he estimated the qnantity at 1,858,000 cnbic miles. Of this 1,046,000 cubic miles range in temperature from 33.6 to 35. Between the temperatnre of 35 and 40 there are 582,000 cubic miles; from 40 to 50 degs., 180,000 cubic miles; and from 50 degs. to the highest temperatnre, which is found over at Honolulu, 73¼ degs., the volnme is 100,000 cubic miles. In other words, the film of snrface-water ranging from 59 to 73 6-10 is only one-tenth of the mass of water below it. Apparently the grade is very steep at Honolalu, and off San Diego, bnt in reality it never exceeds one foot in twenty-six; no greater impediment to cable-laying is encountered from Honolulu to Bonin island, where there is the greatest depth of the ronte, 3,262 fathoms, nor thence to Japan. In sonnding to Bonin several snbmarine mountains were discovered, and the lead came np twice in a battered state, as if it had struck rock. The total distances along the route are: From Honoluln to San Diego, 2,240 miles; from Honolulu to Peel island, 3,273; and from Peel island to the coast of Japan, 480 miles; being 5,993 nautical miles, or 6,950 atatnte miles. This does not allow for any slacks in laying the cable.

Fig. 1

Fig. 2



THE SHAKER SASH BALANCE.

Miscellaneous Communications.

Dr. Blaka presented specimens of mica (containing potash, lithium and chrominm), with which gold was associated in considerable qnantity, found at Granite creek, near Coloma—the only specimens, he believed, in whioh gold had been obtained in any other vein of mineral than quartz. The apecimens did not occur continuously, bnt in patches, and occurred in an altered porphyritio rock. They were a very beantiful microscopio study, and the formation indicated that the gold mnat have been deposited by aqneons solution between the thin flakes of mica.

The President read a paper by H. Edwards, on the Pncifio coast Lepidoptera, being the sixth of the series.

The New Constitution.

Professor Davidson reported that the trnstees had held a nnmber of meetings with regard to framing a new constitntion, and had called in to their aid Jndge Cnrry, R. C. Harrison nnd Samnel Wilson. They hoped to present to the Academy at the next meeting such amendments to the constitution as were required to guard against mistakes in the management of their property.

The Amador canal has been completed. This importnut work has cost nearly $300,000. The main canal is 46 miles long. The capacity of the canal is about 5,000 inches for 12 hours in each 24. The canal runs throngh extensive placer and hydraulic claims, which have heretofore remained nnworked, owing to the impossibility of obtaining water.

Commencement at Oakland.

The annnal commencement exercises of the University of California were held at the First Congregational church, Oakland, on Wednesday last. The church was neatly trimmed and the sceae was brilliant and effective.

The salutatory was pronounced by Thomas Francis Barry of San Francisco; the valedictory by John Maxon Stillman, also of this city. "The True Scientific Spirit" was his theme. Mr. Barry was eqnal in rank with Mr. Stillman, and it was determined by lot to which of the two the salutatory should be assigned.

Samuel Benedict Christy, who was down on the programme for an oration on "The New Science," was nnable to be present on account of severe illness.

Isaac Freud, of San Francisco, the next speaker, chose for his snbject "What Constitutes a Prosperous and Progressive Nation?"

Daniel Griffiths, of Grass Valley, delivered an orstion on "The Career of the Civil Engineer" Mr. G. graduates from the college of engineering.

Edward Allen Parker, of Grass Valley, spoke of "The College World."

Abraham Weadell Jackson delivered an oration on "The Influence of Pnre Science on Materisl Progress."

Joseph Cummings Rowell, of San Francisco, appeared as the poet of the class. His snbject, "The Voice of the Heart," came next.

John Randolph Farrell, of San Francisco, chose for his subject "Nathaniel Hawthorne," It was the tribute of an enthneisstic admirer of the author of "Twica Told Tales."

The speakers each and all acquitted themselves in a most commendable manner. President Gilman then addressed the class, congratulating its members on the succesful resnlts of their four years' labor in the fields of science and literatnre, after which the Bachelor Degree was conferred upon fourteen young gentlemen and one young lady.

The degree of Master of Arts was conferred upon Everett Benedict Pomeroy and Clinton Day, both grndnates of the university.

The university prize to the most distinguished gradnate of the year was awarded to Thomas F. Barry of San Francisco.

The Associated Alumni

Held their annnal gathering at the College of Letters at Berkeley, where a fine collation was spread and discussed by all, after which there was the usnal brilliant season of "flow of soul," over which Dr. A. L. Stone presided in a most admirable manner. Prof. Watson, of the University of Michigan, and Prof. Young, of Dartmouth, were present, during all the exercises of the day, and delivered brief addresses at the meeting of the Alumni.

The James Lick Mining Co.—We notice with pleasnre the incorporation of another mine, formerly known as Keltz mine, and now called the James Lick Gold Mining Co., located on the south side of the sonth fork of the Stanislaus river, Tnolumne mining district, Tnolumne county, California, distsnt about 12 miles northeasterly from the town of Sonora. It is on the great mother lode, and in close proximity to some of the very best mines now being worked in the State. Among the number may be mentioned the Riverside or Telegraph, now sufficiently developed to insure a permanent lode of rich ore; after a slumber of nearly 10 years, this mine is almost inestimable in valne. The James Lick is similarly situated, being elevated fully 1,700 feet. Two shafts have been sunk 40 and 70 feet, respectively, with tunnels to intersect tho lode, showing average width of lode three feet. Several tons of ore taken ont gave over $17 per ton. It is tha intention of the anperintendent to run a tnnnel to strike the ledge 1,700 feet from the summit or out-crop, extracting at the sama time the ore, nnd thna make the mine self-sustaining. The company's capital is $1,000,000—in 40,000 shares of $25 each. H. C. Blake is the secretary, 333 Montgomery street, San Francisco.

The San Francisco Bridge Co. have commenced the Watsonville and Santa Cruz Railroad bridge over Aptos creek, and have all the material at hand to finish it. The Soquel bridge is progressing as fast as the supplies of timber arrive. The Valencia creek bridge, near Ben Nichols' place, will be erected before November, when the laying of the track will be commenced.

The Gwin mine, Calaveras county, is progressing favorably. The mills are kept in constant operation, the stopes from the 800-foot level furnishing the quartz. Rock enough can be obtained from that source to keep the atampa in motion for a couple of months longer, by which time the 900-foot level will be run.

A party of prospectors, hunting for quicksilver in Sonoma, lost their tent and its contents by fire last week. One man lost $250 in gold notes, a $325 gold watch and a $100 rifle. That man had more personal property than prospectors generally are possessed of.

A narrow gauge railroad project between San José and Alviso, Santa Clara county, is on foot.

A clean-up at the Orleans mine, Placer county, last week, yielded $4,500.

Montana Silver Mines.

A correspondent of the Helena *Herald*, writing from Bozemsn, Montena, says: There are vast districts in eastern Montena hopelesely sterile, and bleak enough for an Esquimaux; but there are aleo vsst stretches of country between this point and the Nebraeka and Dakota lines of matchless fertility end genial winters, which are destined et no distant dey to he the centers of proeperons and industriove communities.

The Black Hills and Omaha.

The probable result of Gen. Cnstar's expedition to the Black Hille will be to give "bsck bone" to Omaha in the ehape of a northwestern tributary trade, the magnitnde of which your capitalists have do sdequate idee, as yet. I mey have more to ssy on this heed in fntnre letters.

The Silver Mines of Montana.

I think it well to direct the attention of your readers generelly, to the rich and extensive silver veins in this section, for I know no good reaeon why Omaha ehonld not hecome, in the near fnture, famous for the reduction of oree. Your correspondent knows whst a eilver mine ie. I spent the greater part of last summer examining the veine of Nevada and Uteh, aad had before wide experience in this field. And yon are assured that some of the most extensive and productive silver mines on the continent will be deve!oped in eastern Montana. Some are within a day'e hauling of the hanks of the Yellowetone river, which hundreds have descended to your city, and points lower down, on mackinaws—the trip being safe, pleeeent and expeditions. Lumber is ahundant in the Upper Yellowstone valley, and the coet of a good, snbstential flat-boat is bat little more than the time required to put it together. I believe theee ores can end will be laid down on your levees at $5 and $10 per ton; but suppose the transportation shonld amount to five times that, they ere rich enongh to justify the transportation. A brief description of one of these veins may be interesting to suoh of your citizens es hsve had experience, and such as wish to be informed in regerd to eilver mines. I will single out as one of the most prominent, the "Homestake," owned by Jacob H. Yum—one of our snbstantial live etock men, who knows nothing of mining operatione. It is sitnated 40 miles northeast of Bozemen, and is within 20 miles of the Yellowstone river by a down-hill roed. The surface formation is lime and slete—which may he said of the most productive silver mines of North and Sonth Americe. I made a peresnal inspection of the "Homestske" the other day; and believe it would rank smong the first of the silver mines if it were in Utah or Nevada, but here, isoleted and cnt off from the finsncial centers as we are, it has a mere nominal value. The discovery shaft is only down twenty-five feet, but the ledge may be treced its entire length by bold croppings. The vein proper is seven feet wide in the bottom of discovery shaft, and the walls are covered with "slicken sides" and are the most regular I ever examined.

Two Classes of Ore.

The ore expressed is of two clesses—both milling and emelting. The Galena or smelting ore, onr locsl assayers report to run from $90 to $200 in silver, per ton, besides yielding a fair percentage of gold; end some of the milling ore, being of the chloride claes, ia fahnlouely rich, yielding high up in the thousande. I told the proprietor that if some men I knew of owned the property, and could command the necessary capitel, es he can, they would not sleep until they had tons of the precious ore en ronte for reduction works. He indifferently replied that when "he got thronph haying and gathering his lost cetile up, he might take out a few tone and ship it, if it didn't cost too mnch." That mine would readily sell, if in Utah or Nevade, for a million dollere, and "selting" would not he required either.

Other Veins.

This was the only mine I exemined, bnt I wea oredibly informed that there were others as rich. Why do not yonr enterprising speculatore turn their attention hither, not to purchase, but to secure to Omaha the control of the reduction of Montana ores?

Omaha Interest in Montena Silver.

I feel confident that the oree from the mine described conld he laid down on your levee, hy ehipping in flat-boats, at $10 a ton, at the most; and I helieve the "Homestake" alone, thoronghly opened, would give employment to hundreds of men, and keep one large emelting eetablishment in constant operetion. It seems to me this enterprise might he fostered into one of your most important industries.

Original Gold Hill Quartz Mining Company.—Yesterdey and the day before the donkey engine end hoisting apparatus lately used at the new shaft of the Sierre Nevade mining company were removed to the mine of the company named ahove. The company heve a shaft back or west of the old Confidence mine, Gold Hill, where the machinery will at once he set np. Their shaft contains three compertments of the nsual size, and is down 340 feet. The shaft ie well and suhstentially timbered, end work can be resumed in it withont eny delay for repaire. It is seid that ore can at once he taken ont of the mine that will pay well et the present oost of milling, though in the esrly days the milling left nothing for the owners of the ore. The new machinery will he in running order within the next fifteen or twenty days. J. C. Corey will have charge of the work as Superintendent.—*Enterprise.*

Machinists in the Navy.

The following interesting items we take from the *American Artizan*, end further informetion on the snbject will be given to partiee inquiring at room 3 Government Buildiag, in thie city:

By a recent order of the Navy Department, the pay of mschiniste hae been increaeed to $76.50 per month; thie, with the connected ration, makes $84 per month. Thie alterstion in the stetne of machinists will tend to eecure a hetter claes of men than heretofore. As there is conciderable misunderstanding about this grade, a few worde of explanation will be of benefit to those desiring to epply for it. A "machiniet" is an appointed petty officer of snperior grade; and, on board ship, hes, with the appointed officers, a separete mess, which ie supported by its mese as they mey see fit. He mey have permission to go on shore when his services are not required, provided his deportment and attention to duty have been setisfactory. The duty imposed is to take charge of the engine and fire-room hatches, under the general direction of the engineer officers. The qualifications are, to have some experience in ranning condensing engines of ocean, lake end river eteamers. The candidate may enter the service by applyiag to the commandant of any navy-yerd, for examination, or he may be exsmined by the chief-engineer of any vessel going into commeicion; aad, if accepted, appointed hy the commsnding officer; in either case, the poeition and dutiee on hoard will he the ssme. The candidate need not necesserily be a mechinist by trade. He must over twenty and under forty years of age. He must pase the usual medical examination ae to his fitnees to enter the navy. He must write and spell correctly, and calculate in the first four rulee of arithmetic, to enable him to write his steam log, and calculate the coal eccount and register of revolutione. He must he able to name the parts of a marine engine, and their uses. Valvee and cocks on a merine hoiler, and their uses. How to raise steam, start, regulate and stop a marine engine. To guard ageinst the water in the boiler becoming salted. Foaming and checking it; firing, cleaning fires, and guarding against casaulties that may occur. The uniform is a navy cep, blue cloth jacket, or sack cost, with brass bntons, and embroidered device on cuffs, cloth nevy vest and pantaloons. The general impression is thst this grade is similar to oiler or water-tender, and that when steam is not nsed, the machinist is required to do deck dnty; this is a mistake. They have a table to eat from, and a cook to prepare and serve their food; and, if well managed, they can live es nicely as at their own table at home. They can leave their families half pay, $37.50 per month, payment at the nearest naval paymaster's office. Thie is en excellent opportunity for intelligent men of experience to travel, save money, end have many opportunitiea to improve themselves in theoreticsl steam engineering; for, however ambitious our merchsnt engineers are to acquire a proficiency in the theory of their busiiness, they have no inclination to study or receive instruction efter a six hours' watch on a coasting steamer, or a hard day's work in e shop. The pay is equal to e fair workman's wages, and is more certain, and he would be treated with as much consideration as he gets at our lerge shops. Besides this, he has excellent medical attention. There are in our cities many good, sober, intelligent men, who held acting appointments during the war, who would find this an excellent permanent position. To those of not very extensive experience, it would be a good school to give them in time first-class papers in our merchant service. There ie nothing degrading in it, and they are not put on a level with the class of men who are driven into the neval service hy intemperence, improvidence, and a desire to escape work.

The Oil Regions of Los Angeles.

The following is from the Los Angeles *Herald* of Monday last: The works on the Temple claim are now completed, end boring will he commenced in a few days. The cleim is sitnated five miles west of Lyon's etetion, in a rocky cañon of the San Fernendo range, end is surronnded by towering mounteins a thousand feet high. The oil flows from meny eprings, and is et present lost, there heing no tanks to receive it. They will hore at the rate of 10 feet per day, and the indications are that they will get e flowing well within 400 feet. The show of oil upon the surface is very greet, and without any work having been doue to develop the springs. The oil refined at Lyon's station shows that it is of e superior quality, and non-explosive. The well sunk on the Wiley claim some years ago, although only 100 feet deep, flowa a continnons stream of oil, which is now loet, however, there being nothing to save it in. The Moore spring and the Pico spring are now being developed, and show flattering prospects. The line of the Southern Pacific railroad passes within three miles of the oil springe, and it will he easy to trensport the oil to market. The history of the Hughes claim ie a singular one. In 1865 Mr. Hughes, the owner of the famous Hughes cleim, heing about to bore for oil, and being a strong Spiritualist, applied to a medium to indicate the spot where he would probably find oil. A certain spot was indicated, and, after horing 150 feet, a flowing well wes struck, the oil heing of the finest quality; but, unfortunately, at the moment of success, the boring tools got fest and it was impossible to extricate them. Several efforts have since been made to extricete them, but hsve failed. Wood and water are abnndant in the immediate vicinity. It wonld he e delightful reeort for touriets—among the forest-clad mountains and romantic cañons. Game is abundant, and this is truly the home of the honey bee. A bee cave was discovered here a few days ago, in which there can be seen 24 layere of honoy. The femons ceve discovered some years ego, which ie supposed to contain a ton of honey, is truly an object worth seeing, the swarm of hese constantly peseing in and out of the cave being immense. A beeutiful waterfall, 100 feet high, hes been found here among the pine mountaine. It is surronnded hy pine trees 100 feet high. Petrified wood and many natnral curiosities abound in this region.

The Pine Belt Quicksilver Mines.

A correepondent of the *Post* gives the following reesons for the emsll production of the Pine Flat minee: As the question ie frequently asked why the Pine Flat, or rether the Cinnabar, district does not send iato market more flesks of quicksilver, I will respectfully answer. As early ae 1860 cinnshar was known to exiet in the chain of mountains lying east of thie place, extending from Squaw creek in the northwest, to St. Helena mountain in the southeast. Locations were made at thet time, and still later in 1864 extensive prospecting was done in the varions pleces on the line of the metallic belt. The imperfect knowledge in the practice and science of "rock" mining in those days, together with the nominal value of quicksilver, made the enterprise unprofitable, hence the totsl abandonment of all the locations. The demand for quicksilver heving increaeed so very much of late years, induced many men to locate, prospect and develop this metallic belt, as some of the locations were developing extremely rich. The ring, not being in a condition to hny, determined to stop their yield. They had Congress psss thet rascally mining Act setting the limitation at Jnne 10, 1874, for all previous locatione of *whatever date* to have conformed to law. Fearing their object might not be eccomplished they had the time extended to Jsnuary 1, 1875. The gate being thrown wide open, as yon may suppose, individuals entered end claimed a priority of location, hence the developed mines ere lying dormant under the ban of litigation, or are worked elowly nnder injunction. This stete of things may continue for yeers. Other locstions in favorable localities are owned or managed by greenhoras. Deep and expensive ehafts are snnk off the leed, and on the wrong side of the dip. Tunnels are being run from a long way off the lead to strike it at a good depth on its broadside, when tunnels could be run end on from the same depth. Some mines sre developing slowly under the muscle and intelligence of the children of the flowery land, intelligent and skilled white labor declining to work nnder their menagement. There are other evile existing having the same tendency. I have been in many mining dietricts or rock camps, but have never known one to have so many impediments to its developments and prosperity as this of Pine Flat. Thet rich and extensive deposits of cinnahar exist in this belt nohody doubts who sees tho tons of rich float that are now being, and have been, picked up in the vicinity of this place. The precise lead or place in the belt from whence it came remains to he fonnd. If gold and silver miner of California and Nevada want cheap quicksilver they had better come here and own the minee.

Great Gravel Mining Field.

Lowell hill is situated abont six or eight milee from the town of Little York. The Swamp Angel company have a mine et this place. They have procured a patent to the ground claimed by them, and have been engaged in working the same during the preeent spring. Fonr men during the last four weeks took ont $1,180. All the modern appliences are nsed in the mine. It is owned by J. B. Frick end Albert A. Nutter. Adjoining Swamp Angel ie the Golden Bull cleime, owned hy Jes. Hill. In these claims a six hnndred foot tunnel hes been run and is now completed, and fine gravel was strnck as soon as the tnnnel wee in. They employ five men, and oleen up once e month with eatisfactory returns. Adjoining Swamp Angel on the south ere the Wild Cet claims. The compeny has let e contrect to run a tunnel a thousand feet, end they expect to strike the pay channel before that distence is reached. The Excelsior hill compeny are doing first-rate. Coarse gold ebounde in the grevel, and large piecee are frequently found. One nugget wes found last week which is worth $45. Wicke brothers have recently pnrchased a claim in the vicinity, end have dug a ditch to the South Yuba canal company's ditch, so as to oht in water, and will soon commence washing. They have a good claim, and it only needs opening and plenty of water. Remington hill is in full hlast. Three companies are working a full force of men, and the clean-nps are firet rate. Little York is one of the best mining townships in the county, and it is scarcely prospected. There are milee of grevel which has never been touched. Between the towns of Little York and Lowell hill the road leads over one continuous bed of gravel, and if water was brought to it and an outlet obtained, there is no possibility of its failing to pay. The whole region affords a splendid field for prospecting and the inveetment of capitel.—*Transcript.*

Coal Mining in China.

Some information is given upon this snbject in the officiel report upon the trade of Tamsny, including Kelang, where coel beds abound in great quantities. The eystem of working theee minee—ae indeed Chinese mines generelly—ie exceedingly primitive and imperfect. Places where the mineral ie observed cropping out of the hill-sides are selected, and sn opening 5 ft. high or more by 2 ft. wide is driven horizontally for a dietance of some forty yarde, terminating in a central chsmber, from which workinge 100 yerds or more in length rsdiete in e direction which usually inclines elightly upwards. In these workinge, which in many cases can only be entered on all fours, the miners carry on the work of excavation, squatting in mud and water, and breathing a most foul atmosphere. One mine usually employe ehout twelve or fifteen miners, who earn wages equivalent to 1e. 6d. a men per diem, which ie an extremely high rate in Chine. The usual length of a day's work ie about eleven hours. The miner is ermed with a pick shaped like a eledge-hemmer, with one head pointed, and weighing ahout six pounds. The length of the iron head is about 8 inchee, and of the wooden shaft sbout 2½ ft. The miner's lamp is a saucer of oil with a rneh wick laid into it. The coel is drawn along the pit floor to the month in e baeket about 3 ft. iong, fastened on a bosrd with a rattan cord attached hy which to haul. Occasionelly the boerd ie fastened on rollers, and travels on planke laid down for the purpoee of formiag e rudimentary tramway. In consequence of the imperfect tools employed great waste occnrs through so great a quantity of coal being reduced to a powder.

The ventilation of the mine is left to itself, and it is stated that no system of pumping out the water is employed. The water rnns out at the mouth of the mine, and in ceses where the galleries take a downward direction, the only reeource left is to abandon the working when the water excessively accumulates. Firedamp is unknown, but accidents often happen in consequence of the side or roof falling in, which from the insnfficient wey in which they are secured is almost inevitable. Generally speaking, it may be assumed that the coal-working et Kelnag is little more than a scratching of the surface, and that the real coal-beds mey be considered to be practicslly untonched. The Chineee Government rsther pnts drawhscks in the way of these mines than offer facilities for their working. The owner of land which contains coal is not permitted to open a mine without previously obtaining the sanction of the authoritiee, which involves great delay and expense, and is after all uenally refused. As to the introduction of machinery for the better working of the mines, the proprietors have not sufficient capital to purchaee anoh machinery, nor do they wieh to do so. Supposing, however, that they were both able and willing, it is stated that euch an innovation, accompanied ae it would be by the employment of foreigners, would be the immediate signal for the closing of the mines by the mandarins, and the not improbeble loss of the proprietor's head. The quality of this coal has been favorably reported upon by competent engineers, and it is stated, in fact, on good authority, that for houeehold pnrposes Keluag cool has no superior.

Panamint.

The prospect of a great future for this camp seem to be as well assnred as it is poesible for ledges of monstrous size end wonderful richnees to insure euch a result; it is only e question of time, and very brief at that, unless some unforseen or unusnel difficulties should be encountered when it comea to reducing the ores on a scele commensurate with the size and nnmber of the ledges now exposed. But the beet informed and those most interested have no fears whatever on this head; the ores are of the samo charecter as those of Benton, which by mill process, are being worked all the time with splendid results. Qnantitiee of those from Panamint ere being packed to Cerro Gordo and put thronph the furnaces, yielding magnificently by thet process. The mechinery for the Jacobs' mill is now at Los Angeles, and will be in camp in a few days. By the time this is ready to steem np, another of four times ite capacity is well under way. The latter belongs to the Panamint Mining Co., in which Senetor J. P. Jones is largely interested. These a snccess and scores will follow, becenee the ores are there to supply them, and there is an ebnndance of fuel and water and trees suitable for mining timbers.

But paseing the minee and mills for the present, we will refer to other matters of interest to travelers. The grade acrose Slate renge is now completed; it was for this that Mr. Kennedy asked and received Loe Angeles aid. The toll road is aleo finished; Mr Reddy, just returned, took the first buggy, and the eecond vehicle of any kind over it. There ere no hotels, saloone, stores or stables, or similar accommodations for men or heaet, except for the latter an abnndance of bunch grase, and six miles distant a horse ranch; for the former a big tent known as the Hotel de Bum, heving a good cook, plenty of grub and welcome for the stranger, no charges or known owner, unless it is E. P. Rains, now aheent; plenty of materiel for stockade nonses, hut no lumber obteinable except imported, costing abont $120 per M.; heef market well supplied; popnlation rapidly increasing—something over a hundred there now.—*Inyo Independent.*

DEWEY & CO'S

SCIENTIFIC PRESS

Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Mining and Scientific Press. We transact every branch of Patent soliciting business, obtaining Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free.

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.

The few compositions, which have won the confidence of mankind and become household words, among not only one, but many nations, must have extraordinary virtues. Perhaps no one ever accured so wide a reputation, or maintained it so long, as Ayer's Cherry Pectoral. It has been known to the public about forty years, by a long continued series of marvelous cures, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the Cherry Pectoral has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy be taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

Invention and Progress.

The world is fast learning how it can moat easily earn its daily bread—how labor can be made most productive for the supply of physical wanta. Scarcely a day pasaes but we hear of aome new inventiou which ia designed to aid toiling humanity in its atruggles to overcome certain obstacles. Though many of these fail to accomplish the object for which they are deaigned, a large proportion are of real benefit to the world at large. Even thoae inventiona which are partial or total failures are, in a degree, productive of good, since that very fact incitea the genina of the iuventor to renewed exertions. Moreover, half a dozen inventiona, deaigued to accomplish the same object, may all be failnres, and yet some lucky individual may combine the ideaa of all and perfect the mechanism to a degree not dreamed of by any one of the original inventors.

Thus we see onr machinery, processes, etc., which may be founded on a general principlo and work acceasfully, so improved in detail by new inventors as to be almost entirely changed. The great public scarcely appreciate what a load of toil invention has lifted from their shoulders. The tools, machinery and appliances of modern life are accepted as things that are, with acarce a thonght of the miracles of art and human ingenuity they present.

That many of onr moat cunning devicea will be old-fashioned in another century we must admit; notwithstanding that onr present appliances appear almost marvelous as compared with those of a few generations past. Yet the germs of art have not reached their full fnition in our age, nor ia it likely that the future will plagiarize the present or repeat the past.

Chariot Mill.—The following letter from the anperintendent of the Chariot mill and miuing company, the new California mine located at Banner Diatrict, San Diego county, gives a flattering account of the prospecta: We commenced to hoist from the new shaft yesterday. The work of sinking will now go on with iucreased speed. There is more and richer rock in the shaft than in the lower level. The best rock I have seen come from the mine ia from the shaft to-day. The north stope is turning out very good rock, and the amaller of the two ledges is as rich as ever. The work going ahead in the cross-cnt opposite the south ahaft has cut considerable water, and indicates that the lode is not far diatant. The mill worka well, and it looks as though we wonld have our usnal clean-up. A diapatch from the mine dated the 17th says: The mine looks well. The croas-cnt is making good headway. The clean-up amounts to $9,500 for twelve days' run with our 10 stampa.

Yakima Mines.—A letter from the Yakima mines, dated June 24th, says: The miners on the Pishastin and a tribntary of it, called Nigger creek, are making fair wages—from $3 to $6 per day. The minea on this side of the range on the Smock and Yakima are variable. A good deal of mining outside of discovery has ceaaed, the men have become discouraged and have gone prospecting in other quartera, while the discovery boya are sometimes doing remarkably well. Week before last they (six men) took out $500. One piece weighed $184.67, another $33, and from that down to $6. It was nearly all coarse gold. Then the week following they did not make to exceed a dollar per day to the hand. Old minera are aorely pnzzled as to where that pay streak extends.

Claim Rejected.—The claim of the Pennsylvania mining company for a patent for the Pennsylvania gold-quartz mine in the Maryaville (California) land district has been rejected by the General Laud Office for the reason that their notice was not published for the proper length of time, and the application was not aworn to. The Jefferson mining company was the adverse claimant in the case.

Strike at Calistoga.—A dispatch of the 22d from Calistoga says: A rich discovery was made in the California silver mine yesterday. A large body of ore, aasaying over $500 per ton, waa struck at a depth of 200 feet. A great many visitors went up to the mine yesterday, and there was a general rejoicing at the favorable proapects.

Work on the California Borax company'a mine, at Sulphur Banks, Lake county, is being vigorously pushed forward in the way of running open cuts, excavating for and putting up new buildings. The company is having the buildings and machinery at Borax lake removed to the mine.

The new hoisting works of the Sierra Nevada mining company have beeu entirely roofed in. Pipes nre being laid up the aide of Cedar hill, to the flume of the water company, to furnish a anpply to the new establishment. One large wooden reaervoir has been completed, and nnother will be ready in a few daya.

Prospecting the fourth station level of the Chollar Potosi mine has been abandoned for the present, there being no enconraging indicationa of the development of any paying ore in that level.

Dr. Gally, better known to readers as "Singleline," the Nevada poet, haa atruck it. He and a partner recently sold a claim for $75,000.

General News Items.

That Big Roof.—The shingling of the vast roof of the Mechanics' Institute Pavilion is nearly completed. Fifteen men are at work at this job alone, putting on shinglea at the rate of about 80,000 per day. It ia estimated that 1,500,000 shingles will be nsed in completing the job.

The graaahoppers made a clean sweep in Sheridan valley, Montana, this year. The valley ia uaually one of the most fertile and prolific in the Territory, bnt the peata have eaten "every green thing" thia season.

"Aspirations and Realizationa."—This is the title of a story iu verse, written for children by George G. W. Morgan, and printed by Winterburn & Co. of this city. It is a wholeaome little poem.

Indian War.—The Indian war, so long feared, appears to have actually broken out near the Cheyenne Agency. Quite a number of settlera have been slain, and the Agency itself threatened.

The *Union* is reaponsible for the atatement that the Sacramentans are now obliged to carry six-shooters to protect themselves from the mosquitoes.

The Grasshopper Plague in Minnesota is still the aubject of mnch comment. Very little abatement is reported. The damage to the orops ia already quite large.

A large nnmber of cattle have been driven into the monntains of Amador conuty, during the past week, for summer pasturage.

Steel raila are to be laid down on the Panama railroad: already $500,000 worth have been shipped for that point.

Robert Watt's aheep ranch overseer, in the lower conntry, lately decamped, leaving hia accounts minus abont $10,000.

Jake White, of the Virginia and Gold Hill omnibus line, has eleven horses laid up with the new epizootic.

The Burleigh drills are working successfnlly in the Idaho mine, Grass Vnlley. They not only work the mines cheaply, but open them np so rapidly that a larger force of men will have to be employed.

The mining region of the Stickeen is conceded to be rich, but the shortneaa of the aeason and the small number of claims makea it a poor place for more than a few men.

The Carson river ia piled full of wood at Dayton, and a large number of teama are engaged in hanling it to Gold Hill, Sntro aud Silver City.

The tnnnel at the Blue Gravel mine, near Mooney Flat, is now in 800 feet. They will probably have to proceed 1,400 feet more before reachiug pay dirt.

The Winnemncca *Register* says that rich placer mines have just been discovered on Bartlett creek, sixty milea northwest of Winnemucca.

A new giraffe haa been put in the Belcher incline, which hoists seven tons of rock at a load. A back-action is added to this, greatly increasing the load.

Thirty thouaand dollara was the nice little clean-up for the Manzanita mine, near Nevada City, a few days since.

The new machinery ordered for the Juatice mine will be among the moat powerful in nse on the Comstock Lode.

It is stated that the famons Tiger mine, Arizona, will soon pasa into the hands of a London company.

A 20-stamp mill will soon be built in Cedar diatrict, Mohave county, Arizona, by Colonel Buell.

A company has been formed in Nevada county on the co-operative principle, with the object of taking up and developing mines.

For the two days ending July 13th, a total of 200,000 pounds of bullion was shipped from Enreka.

From seven to eight thousand pounds of bullion are being smelted daily at the Trnckee smelting works.

Borax.—San Francisco shipped 10,110 packngea of borax dnring the half year ending Jnne 30th, 1874, valued at $153,721.

The value of the lead shipped from this port by sea during the past half year was $268,808.

Adolph Sutro delivered hia lecture on "Mines and Miuing" in this city three timea thia week.

The Cloverdale quicksilver miuea are being steadily developed.

John C. Smyles haa been re-elected Mining Recorder for Peavine dietrict.

The Lincoln coal, it is said, has been found to be a success for smelting pnrposea.

Rich rock has been strnck in the tunnel run in the San Benito mine, in Mosquito creek.

The Consolidated Virginia mine shipped $147,000 last week.

The Golden Chariot sent down $15,500 last Saturday.

The Eureka (Graas Valley) mine cleaned np 450 ounces of amalgam laat week.

The Sonth Chariot mine cleaned up $9,500 in the firet two weeks of July.

Mr. A. Caldwell has been appointed snperintendent of the Woodville mine.

Meetings and Elections.

Savage Mining Co.—July 16. Trustees: J. A. Pritchard (President), J. D. Fry, J. C. Flood, R. F. Morrow and George S. Dodge. Secretary, A. C. Hamilton; Snperintendent, E. B. Hamilton. For the first time in years there was not a ponnd of ore raised or worked. The receipts embraced $400,000 in assessments from stockholders.

Pauper M. Co.—July 16. Directors: J. H. H. Williams (President), Ieham Case, J. Olem Uhler, Thomas B. Phelny (Superintendent), David Wilder (Secretary).

Eclipse, Winters and Plato Gold Hill Consolidated M. Co.—July 20. There were 20,182 shares represented ont of 25,000 sharee, the capital stock. G. W. Beaver, J. H. Rohinson, H. H. Flagg, Joseph Sharon and Edward F. Stone were elected trustees. H. H. Flagg was elected President and Joseph Marks, Secretary.

Washington and Creole M. Co.—July 20.—Trustees: Georga W. Crandall (President), W. E. Hale, S. W. Levy, P. Cleary and Martin Tarpey. The last named gentleman was re-elected Superintendent and Frank D. Cleary was chosen Secretary. The claim is in the Ely District; contains 1,520 feet, and has levied 11 assessmente of $217,500; but has never paid a dividend.

Yellow Jacket.—At the annual meeting of the stockholders of the Yellow Jacket mining company, held in Gold Hill, on the 20th inst., the following named gentlamen were elected Trustees: Thomss G. Taylor, F. A. Trytle, D. L. Bliss, G. W. Hazleton and T. B. Storer. The following is a liet of officere elect: President, Thos. G. Taylor; Vice-President, G. W. Hazleton; Treasurer, William Sharon; Secretary, George W. Hopkins; Superintendent, Thos. G. Taylor. Thus it will he seen the result was a re-election of the old officers throughout.

Chollar-Potosi M. Co.—July 16. A. K. P. Harmon (Pres.), J. D. Fry, Alphens Bull, Wm. Norris, H. C. Kibbe, James Freeborn and James H. Dobinson, Trustees; W. E. Dean, Secretary; Isaac L. Requa, Superintendent. The operations of the mine for the year have been harren of any good results. Strict economy, however, has enabled the trustee to avoid assesements. There were 32,900 tons of ore extracted during the year, and 35,340 tons reduced, leaving 1,424 tona on hand June 1et. The quantity of ore raised during the previcus year was 48,200 tons against, 33,000 tons the year before. Tha cost of extracting the ore, including repairs, etc., was $6.84, snd the cost of redncticn was $12.44, making a total of $19.28. The gross yield of the ore worked was only $17.47. There waa a nett loss of 1.81 per ton on the quantity produced. The Superintendent epitomizes the financial results for the year in four lines, as follows:

Expenses by all sonrces		$634,023
Received from bullion	$517,391	
Received from other sources	2,539	619,930
Nett loes for the year		$64,093

The Secretary's report is as follows:

Receipts.

Proceeds of bullion eold	$617,270
Last year's balance from Superintendent	1,500
Cash on hand per last statement	133,393
Total	$762,163

Disbursements.

Working ores for the year	$434,762
Labor at mine	174,757
Timber and Lumber	29,238
Wood	9,223
Hardware	7,586
Water	8,255
Taxes	5,358
Discount on bullion and drafts	19,772
Office arpenses	8,854
Machinery and materiale	8,257
Miscallaneous	18,017
Total disbursements	$722,089
Cash on hand to balance	30,074
Total	$752,163

The mine has paid its stockholders $3,080,000 and collected $602,000 in assessments. The cost of working ores last year was $1.85 more than in 1872.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

Tolman & Miller Mill and M. Co.—July 16. Location: Sandy guloh, Calaveras county. Directors: D. A. Miller, R. M. Griffin, George B. Tolman, Austin Smith, A. Craig and James L. Trask. Capital, $900,000.

Lincoln S. M. Co.—July 16. Location: Napa county. Directors: Coll Deane, Archy Borland, Thos. R. Hayes, Alexander Badlam and August Hemme. Capital, $8,000,000.

Florence M. Co.—Jnly 17. Location: California, Nevada, Arizona and Utah. Directors: Michael Hawkins, Jos. Daly, Thomas H. Blythe, Jas. H. Daly and William Phillips. Capital, $2,000,000.

California Oil-cloth Manufacturing Co.—July 17. Object: To manufacture and deal in oil-cloths in this city: Directors: A. C. Corbett, Jnlius C. Reis, Horace S. Ridley, Christian Reis and Hugh L. Carpenter. Capital, $100,000.

Hite's Cove Gold Quartz M. Co.—July 20. Location: State of California: Directors: M. G. Kennedy, B. A. Bedlack, C. I. Kader, J. M. Gove and William Small. Capital, $2,500,000.

Nevada Gold Quartz M. and M. Co.—Jnly 22. Location: Deer Creek, Nevada county. Trustees: I. S. Van Winkle, August Hemme, Jonathan Kittredge, A. Borland and W. L. Palmer.

Increase of Capital Stock.—A certificate of increase of capital stock of the Sierra Nevada Mining Company from $4,000,000, in 20,000 shares, to $10,000,000, in 100,000 shsres, wss filed in the Conuty Clerk's office. The certificate stetes that the whole amonnt of the capitel stock of the corporation was fully paid in, hecauee the capital stock is repreeented by tho mine and worke belonging to the company, which have been fully paid for. The liabilities of the company are put down at $61,000, besides the ordinary current floating accounts.

New Volume.—Tbat valuable mining journal, the Scientific Press of San Francisco, entered on a new volume on the 4th inst. We wish it success, and hope it may increase in size and usefulnesa esch succeeding year.—*White Pine News.*

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., July 21st, 1874.

For Week Ending July 7th, 1874."

Mechanism for Moving Grain in the Sack.—Eliaha P. Kenyon, James J. M. Clebben aud John H. Ollrich, Milton, Cal.

Box for Propagating Plants.—Obed D. Mills, Watsonville, Cal.

Hay and Grain Elevator.—David Morey, Watsonville, Cal.

Stencil Plate.—Geo. M. Wood, S. F., Cal.

Medical Compound or Salve.—John P. Dyer, Pueblo, Colorado Ter.

Medical Compound or Liniment.—Hiram F. Slone and Launcelot Gilroy, Kingston, Cal.

*The patents are not ready for delivery by the Patent Office until soma 14 days after the date of issue.

Note.—Copies of U. S. and Forsign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at tha lowast rates. All pstent hnsiness for Pacifio coast inventors transacted with perfect seonrity and in the shortest time poesible.

GENERAL MERCHANDISE.

WEDNESDAY M., July 22, 1874.

There were received during the week 3,400,000 Bags, nearly all sold in advance. The total number of Wheat, Oat and Barley Bags needed this season for this State and Oregon is put at 23,500,000. Stock carried over and fresh receipts leave the number yet to be shipped from England 7,241,000; or, on a higher crop estimate, considerably more. Prices are firm. Coffee is dull. Coal is steady. Spices are buoyant. Sugar is firm at advanced rates. Quite a movement in salt has been made. Tobacco is likely to rise materially, owing to failures in the crop in Kentucky, Missouri, etc. Turpentine is slow of sale, and 10c lower.

To Mining Secretaries.

An amendment to Section 338 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements

Eagle Quicksilver Mining Company.—

Location of works, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

NOTICE.—is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 1874, an assessment, No. 3, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessment shall remain unpaid on Monday, the 21st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Roome 5 and 5, No. 302 Montgomery street, San Francisco. jy25

Taylor Mill and Mining Company—Loca-

tion of principal place of business, City and County of San Francisco, California. Location of works, Garden Valley Mining District, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of July, 1874, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 607 Montgomery street, in the City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of August, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the twenty-eighth (28th) day of August, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale. SAMUEL S. MURFEY, Secretary.

Office, 607 Montgomery street, City and County of San Francisco, California. jy4

Stockholders' Meeting—Tolman & Miller

Mill and Mining Company. Principal place of business, San Francisco. Location of works, Calaveras County, Cal.

Notice is hereby given that a meeting of the stockholders of the above named company will be held at the office of the company, 306 Montgomery street, on the 10th of August next, at 2 o'clock P. M., to adopt a code of By-Laws for the company.

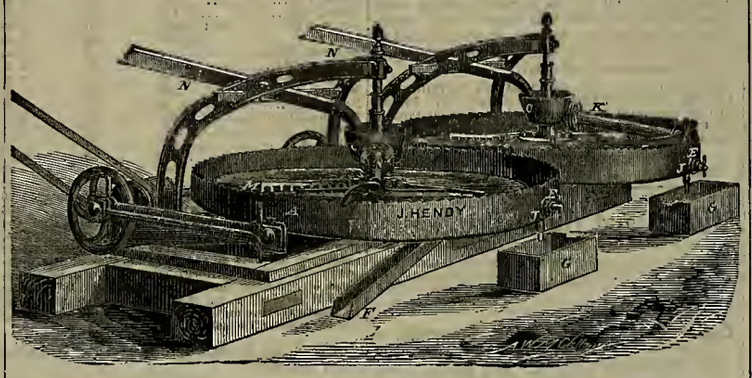
OVER $3,500 PER MONTH SAVED

BY THE USE OF

HENDY'S IMPROVED CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francieco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past, have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.
409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir*:—In answer to your inquiries as to your concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and buddies formerly in use. O. C. HEWITT, Sup't.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for ove four years:

EMPIRE MILL (3 Concentrators).....Grass Valley, Nevada County
NORTH STAR M. & M. CO. (3 Concentrators).....Grass Valley, Nevada County
VULTURE CO. (3 Concentrators).....Prescott, Arizona
NOYE'S & CO'S MILL. (2 Concentrators).....Prescott, Arizona

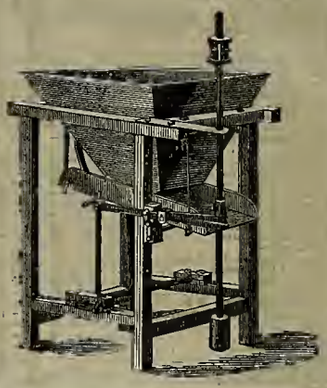
Machinery.

Tulloch's Automatic Ore Feeder.



At the request of Mr. Jae. Tulloch, we have carefully examined his patent Ore Feeder for Quartz Mills, now on exhibition in this city at the Pacific Foundry, and in view of its simplicity of construction, directness of action, durability and compactness, as well as its small weight and the low price at which they are held by the patentee, so as to place them within reach of all mill owners, are free to state our unqualified opinion that we regard it superior to any Ore Feeder of which we have any knowledge in actual work. We are confirmed in this opinion by the severe tests to which it has been put, doing its work thoroughly well on ores of all kinds. We find the delivery to the mortars of the ore-stuff, whether dry, damp or wet, to be entirely uniform and regular, and that even slimes and slush can be worked in them under perfect control.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Morris' Settler and Amalgamator.

PATENTED MARCH 25, 1873.

An important improvement in milling. Cheap, light, efficient and durable. Gains Quicksilver on working tailings. Is discharged from the surface in the center instead of the side, by means of a Syphon which extends to near the center of the Settler. Heaviest casting weighs only 135 pounds. The sides and bottom of the Settler are made of wood, as also Mullers, placed vertically—the friction of which brightens the quicksilver.

One of these machines is in daily operation at No. 616 Merchant street, (basement), San Francisco, Parties desiring information as to rights of use, purchase, etc., can address, FREDERICK MORRIS,
616 Merchant St., S. F.

CHEAP HORSE CORN-PLANTER.

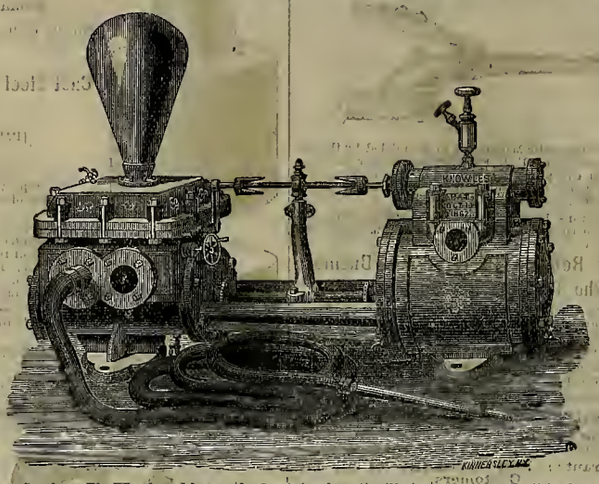
INVENTOR'S DESCRIPTION.—I am aware that a quadruped has heretofore been used in combination with an agricultural implement, and consequently I do not claim such a combination broadly; but what I claim, and desire to secure by Letters Patent, is—

1. The planters B B, in combination with the beast A, constructed an poperated as described.
2. The bands *i i*, and pulley *c c*, in combination with hind legs of a cheap-horse A, to operate the planters and prevent kicking, substantially as set forth.
3. I claim the cheap-horse A, clipped, as shown, in combination with a corpulent driver D, to prevent his traveling too fast, as described.
4. I claim the guide *o*, in combination withthe "tail of a cheap-horse," when said tail is put on in a vertical position, as shown and described.
5. In a cheap-horse corn-planter I claim the tail *b*, when arranged vertically, to frighten the crows, *a a*, as set forth.
6. I claim the worms (not shown) in combination with the "early birds" *a a*, for the purpose set forth.

The yellow dog, with few friends, helng an old device and somewhat at a discount in these days, we do not *set anything on him*, but merely throw him in to accompany the driver D, to give general effect to the patent after it is granted.

The above is dedicated to despairing inventors. It goes to prove that the field of invention has not yet been exhausted. We have not had the pleasure of reading the specification of the inventor, but we can easily conceive of the beautiful pen pictures which its writer might indulge in. The cheap horse made useful, the neat mechanism and its splendid adaptability to the construction of the horse. The advantage of "arranging, the tail "vertically." The benefit of the exercise upon the "corpulent driver," and to end the whole, a dissertation npon the "worms" and the "early birds," not to say anything of the "yellow dog." These points of advantage ought to satisfy the mechanical appetite of even a cheap Patent Agent; hnt jesting aside, the above comical representation is hut little inferior to many inventions which have been made the subjects of letters patent, as a glance through the Patent Reports will show. If any inventors are able to improve npon the above invention we will be most happy to send them one of our Patent Circnlars with full instructions "How to apply for a patent."—*Mining and Scientific Press, S. F.*

KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowles Steam Pump—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours, truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

THE PACIFIC REDUCTION WORKS.

GUIDO KUSTEL - - - - Superintendent.

WILL PURCHASE GOLD AND SILVER BEARING ORES, CUPERIFEROUS SILVER ORES, GOLD SULHHURETS, ETC., AT THE HIGHEST RATES, OR WORK THE SAME FOR ACCOUNT OF OWNERS.

Office, 210 Front Street, San Francisco. 4v29-6m

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

General Agents, No. 210 Front Street.

SAN FRANCISCO, SATURDAY, AUGUST 1, 1874.

VOLUME XXIX Number 5.

Our Gravel Mines.

Few people realize what a large amount of work is being done in our hydraulic mining regions, and what extensive improvements are being made throughout the State, developing these claims. Immense ditches are being built in every direction, which are destined to open up new mines and develop sections of country hitherto unworked for lack of water. Capitalists are turning their attention in this direction, and the news concerning the gravel mines in every part of the State is very favorable. Some of the large companies are carrying on very extensive works, and employing a great number of men. These large companies, such as the Eureka Lake Water and Mining company, the Milton Water and Mining company and the North Bloomfield company in Nevada county, employ large numbers of men and expend fortunes every year in developing the resources of their neighborhood. The *Transcript* says the North Bloomfield company has shown more confidence in the richness of the mines of the county, and expended a larger amount without any returns than any company in that county. They are now employing 625 men in Eureka and Bloomfield townships, to work in their tunnels and ditches. They have expended, since they commenced opening up their mine, one million seven hundred and fifty thousand dollars, and have not yet got their mine opened. An outlet will be secured by means of the completion of the tunnel in about five months. The ground, when reached, will be the best paying in the county.

The long-talked-of and wished-for Amador canal is at last completed and probably by this the water has reached the distributing reservoir. This canal will inaugurate a new era, and under its influence mining will again become one of the leading industries of Amador county. Placer mining ground is being located at divers points within reach of its waters, and as soon as a full supply can be had, a large number of claims will be worked by hydraulic process. The *Ledger* in speaking of this subject says: "We have a large extent of placer mining grounds that can be supplied with water from the canal, and which, when properly worked, will be productive in gold. Ranges of gravel hills extend for miles along the line of the canal, which it will require years of steady mining to exhaust. But not placer mines alone will receive a new impulse from the canal, but quartz ledges heretofore idle will be prospected with a view to water for mills should the rock justify it. Wood for steam in our quartz mills, is becoming daily less, and more difficult to obtain, and our quartz owners will find it to their interest to substitute water for steam as the motive power about their mines. The certainty of an abundant supply of water in all the future, will not only give a new impulse to our mining interest, but will be the means of adding thousands of acres to the present cultivated area of the country. Indeed, we may hail the completion of this noble work as the beginning of renewed activity and prosperity in every branch of business in the county.

Tunnels are being run in various places and work starting up in new mines. The Grass Valley *Union* states that two tunnels to cost over $100,000 each are being run in from the vicinity of Dutch Flat and Gold Run. About 400 acres of auriferous gravel, averaging perhaps 200 feet in depth, occupying the bed of the Dead Line river, are nearly inaccessible at present for want of an outlet or channel. These tunnels will furnish the proper outlet.

In many places in Calaveras county gravel mining operations are being pushed with vigor. The Calaveras *Chronicle* says there is still an abundant supply of water, with no indications of a scarcity in the immediate future. The claims continue to yield well, and as the majority of them are extensive they can be classed among the permanent sources of present and future prosperity.

In Plumas county mining operations are favorably conducted and some large enterprises being carried on. The North Fork company's work is being carried on vigorously, about 60 men now being employed in putting together the iron for eight miles of pipe. This iron was brought from Pittsburg, Pa., and unloaded from the cars at Chico, from whence it is hauled to "Pipetown" on the line of the company's ditch, about five miles from Prattville, by tenmule teams hauling about 12,000 pounds to the load. The Plumas *National* is informed by Mr. Ragan that they expect to finish this work in October. The ditch will be twenty-three miles in length from where the water is taken from Ohio creek to the company's mine on Dutch hill, and the whole cost of the enterprise will probably exceed $150,000. The depression in the line, which has to be crossed by the pipe, is 320 feet. A very large force of Chinamen will be put to work in a short time, and it is the intention of the superintendent to complete the ditch this fall if possible. Surveyor Keddie, with his party, is running the lines as rapidly as possible, and will probably be engaged on the work for some weeks yet. The ditch will pass through tunnels in two places, one 800 feet in length and the other 1,030. Mr. McIntyre, of Greenville, has taken the contract for the two tunnels, and will soon have a large force of men at work, running night and day. The managers of the North Fork company's works seem to be perfectly satisfied that the prospects of their extensive claims justify the large outlay of capital now being made.

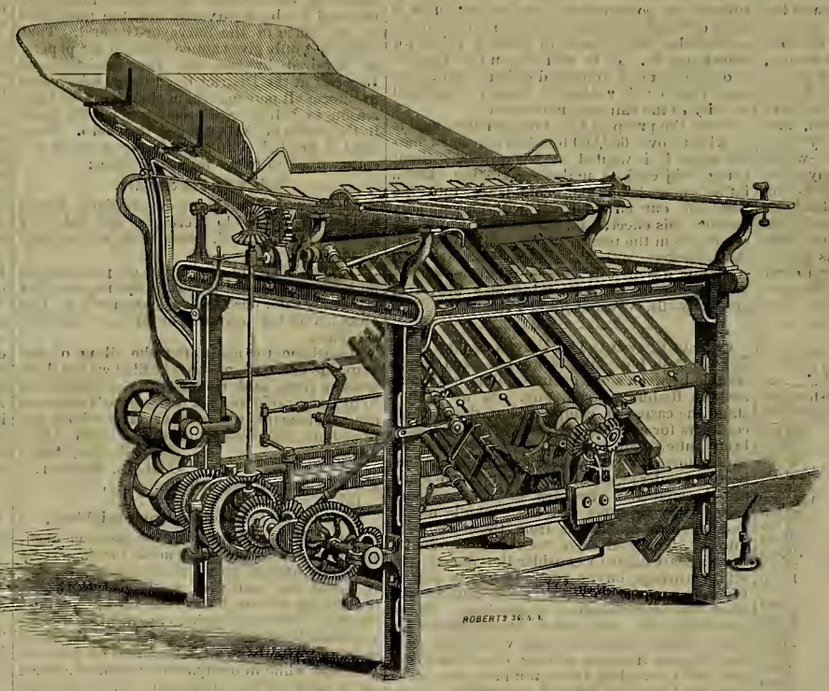
Under Table mountain there still remain hundreds of good claims, and capital only is needed to extend the old tunnels abandoned by poor men in early days, and go after the rich deposits. These claims, however, are not the only ones which could be worked, but many thousands still lie idle within the boundaries of our state which a near future will see worked systematically and with good profit.

The Idaho *World* reports that a Mr. Baldwin, who is mining on North Elk creek, cleaned up 251 ounces of gold one day recently as the result of nine days' work, employing three white men and six Chinamen. Reckoned at $16 to the ounce, 251 ounces is equal to $4,016 or a little over $40 per day to the hand.

The new works of the Sierra Nevada mine, in the Comstock, will be on a parallel in strength and durability with any on the lode.

Our New Folding Machine.

Among the improvements necessary to facilitate our increased business, we have recently procured a patent newspaper folding machine, and as we judge that most of our readers are not familiar with this class of machinery, we give herewith an engraving representing our new folder, which was manufactured by S. C. Forsaith & Co., of Manchester, N. H. Until lately, the folding of newspapers in the publishing houses of the country required a large number of hands to perform, and this item in the expense account was of no little consequence. By the employment of the Forsaith machine, the work is accomplished in a highly superior manner. Requiring the services of only a single operator, the machine will fold, in any desired form, 2,500 to 3,500 sheets per hour.



PATENT NEWSPAPER FOLDING MACHINE.

As will be seen by the engraving, the machine is very compact in form, and is a beautiful piece of workmanship. The printed sheets are placed upon the feed board, and the feeder stands on a small platform beside the machine. He slides the top sheet of the pile of papers down until its edge is caught by the grippers. These grippers carry the sheet forward along the parallel bars seen in front of the feed board, until it is in position to be creased by the blade which is seen uplifted. This blade descends at the proper moment across the middle of the sheet, doubling it, and at the same time starts it between the rollers, which carry the sheet through, folding it once. The doubled sheet falls upon the inclined bars below the parallel bars, and is again doubled by the creasing knife shown below, so as to again start in between the two inclined rollers, and thus give it a second folding. This operation is repeated twice more by similar devices, and the paper falls into the V-shaped packing apparatus, shown at the lower right hand corner of the machine, where the papers are neatly packed.

The machines are made to fold sheets of different dimensions, and the sheets in passing through the machine in the process of folding, are greatly improved in appearance, the results being similar to those produced by the dry press. The papers are, moreover, folded regularly, so that the paper can be cut without cutting the reading matter.

Unpatented Inventions.

The true relation of an inventor during the period which elapses between the completion of his invention and his application for a patent, is not generally understood by inventors. As a matter of course, when an inventor applies for his patent, he has fulfilled the requirements of the law, and his rights afterwards are fully protected; but if he should delay making the application after his invention is perfected, he must necessarily run some risks—exactly what these risks are we now propose to state. Patent agents' circulars, and even some standard works on patents, give prominence to the last portion of section 103, "Curtis on Patents," which reads as follows: "Inventors may now, therefore, permit the use of their inventions, by individuals, for a period of two years, prior to the application for a patent, and still obtain a valid patent, notwithstanding such use. But if the use thus allowed extends over a period of more than two years prior to the application for a patent, or if it amounts to an abandonment of the invention to the public, whether for a longer or a shorter period, the patent will be invalid."

While this statement is correct, it is liable to mislead inventors, from the fact that they are led to believe that no damage can be done to them by reason of the two years' delay; which is not so. The first part of the same article, above quoted, in speaking of the law on this subject, says that it "puts the person who, by the consent and allowance of the inventor, had had a prior use of the invention upon the same footing as if he had a special license from the inventor to use his invention; and at the same time the patent is valid after it is issued against all persons, *except such licensee*, who will continue to have the right to use the invention." This relates, however, only to such persons as use the invention with the consent of inventor or by purchase from him, and would not extend to persons who, without the knowledge or consent of the inventor, made and used the invention. Such persons would be infringers, and could be made to cease manufacturing after the patent issues. Another risk, which an inventor encounters by delay, is the chance of some one obtaining a patent on his invention, or may be for an improvement upon his original device, either of which would cause him expense and delay in righting matters and securing his patent, when he does make his application; as the Patent office always declares an interference between an application and a patent which has been previously issued, even if the former patent did not claim the whole device. These facts are important for inventors.

The mint in this city coined from 1854 to 1867, inclusive, $242,000,000, an amount equal to one-half the total coinage of the Philadelphia mint, from its establishment in 1793 to the same date. Since 1867 to the present time our mint has coined over $90,000,000—making a total coinage of over $332,000,000. The charges at the mint for work done are fixed by the mint law, which enacts that for "parting" gold and silver they "shall be equal to, but not exceeding the actual cost on the operation, including labor, wastage, use of machinery and material," etc. They are very moderate, and are as follows: On bullion, under 300 parts gold, 3 cents per ounce; 300 to 600 parts fine, 5 cents per ounce; 600 to 750 parts fine, 7 cents per ounce; 750 to 945 parts fine, 11 cents per ounce; 950 fine and upward, no charge. The new mint is nearly completed, and the machinery is now being placed in it. Active operations will be commenced in the new building in a few months.

James S. Reed, Sr., one of San Jose's oldest and most prominent citizens, died last week. Mr. Reed came to California in 1846, and was one of the famous Donner party, whose sufferings on the route have a prominent place in the history of this coast.

California Wheat Exhibit for 1874.

Parties who have confinsd thsmselves strictly to facts and figuree in eetimeting ths wheat orop of 1874 do not placs it so high as ths popnlar opinion, influencsd no donbt by the popular wish, had suppoesd ths indicatione of ths growing seaeon wonld werrant. But thsse cerefnl compilers have evidsntly gone ss wide of the mark in gsnging ths popular expectetione in this direction, ss ths lstter party had done in estimating the coming hsrvest. For, from our interconrss with farmsrs, personally end by corrsspondsncs, and after a carefnl peruesl of onr exchsugee throughout the seseon, ws ars inclined to ths helief that pnblic expectetion hss bssn kspt in check to a remsrkabls degree; and that neithsr agriculturs nor trads havs indnlgsd in airy csstls-huilding to any great extent. On ths contrary, thers hss been no svidsncs of want of ballsst in the halloon excursions thst trsde and industry hsvs indulged in dnring the psst season at the sxpenss of the incoming crop. Ths preeent stags of the harvest affords snfficient dsta upon which ws can form an eetimats of ths amount of ths preeent crop. The return aeeme to estisfy the pnblic expectatione and the eame degree of estiefaction is manifested in regard to the condition and proepects of the wheat market.

Ths psst season, it is true, hss been somewhat pecnliar; and in rsgard to the comparative prodnctivsnsse of the valleys and nplands, the tablee have been tnrned in a measure. Ths lats rains, which favored the growth of wheat in ths latter localities, wsre detrimental to ths former, to which we had previously looked for our heaviest crops. Ths unexpected yisld in eome qnartere is considered a fair offset to ths psrtisl failure in others. Lsrge trscts of land in the Sscramsnto vallsy, where grsin was late eown, have besn soaked to a degrse thst rendsred it necessary to out ths crop for hay; whils in epots which wsre nnprotectsd ths crops hsvs been entirely swspt away hy the ovsr-flowing of the river. Ths Antioch *Ledger* estimates ths loss from thia eonrce in that connty slone at $1,000,000. The over-worked soil in ths lowlands, whers ths wheat was allowed to matnre, has not returned an average orop, eigns of exhaustion appearing fsr more palpable than in any formsr sesson. Conld thess localitiee hsve eecaped the rsversee hsrs ennmsrated, and conld the higher lands, meanwhile, have yielded their pressnt unprscedented abnndance—which wonld havs bsen impossibls nndsr any other circnmetances than thoss nnfavorabls to the lower lying locslitise—we should probsbly be able to report the wheat orop of 1874 ae double that of 1873; whereas, it ie estimated by those who have redneed the matter, se far as practicable, to figurss, as bsing about one-fourth only in excsss of lsst year'e product. We give below a carefully compiled eetimats of ths crop of 1873, compared with that now being hsrvestsd:

COUNTIES.	1873. Acres.	1873. Yield. Centals.	1874. Acres.	1874. Estimated yield—C'tls.
Alameda	68,000	408,000	75,000	600,000

Tulare	30,000	120,000	50,000	400,000
Tuolumne	6,000	30,000	12,000	84,000
Ventura			12,500	100,000
Yolo	100,000	700,000	100,000	700,000
Ynba	20,000	146,000	20,000	150,000
Total	2,063,420	12,676,470	2,490,700	19,891,800

Barlsy is nsxt in importancs to wheat in this State. The avsrage of the crop of 1874 is about 100,000 centsls in excess of that of 1873, and the yisld is in abont the same proportion. The crop of 1874, covering 509,200 acres, is estimated at 5,986,200 centale.

Ths qnsstion thsrsfore as to the amonnt of the pressnt crop is sbont ssttled to the satisfaction of the conntry at largs; thongh amid this general rejoicing we shonld considsr that in many cases individual farmers, and in others whole nsighborhoods, havs euffsred by short crops in eoms placee, and by eweeping miefortnes in othere. Thsrs ars two qusstions yst rsmaining which combined mey bs considered as nsarly, if not qnite "half ths hattls." These unanswered qnsstions are "what will the whset bring in ths merket, and whst are ths fecilitiee for eending it there?"

The commerciel espect of the whset prodnct hse been ae carefully watched as was ths crop itself, in its diffsrsnt stages of production. It is, of conrss, impossibls at preesnt to fix ths exact price at which the bnlk of ths crop can be eold; but enongh is known in rsgerd to the condition of the wheat market of ths world to warrant the belisf thet prices will not rsngs helow thoss of last year. In no countries of Europe is ths crop of 1874 rsported as in excess of that of 1873, whils in soms it is known to bs below ths averags; and whsn to this gsneral enpposition ths acknowlsdged fact is added that ths stock of whest on hand, both in thie conntry and in Enrope, ie cleaned out to a degree nnnsual at thie season of the yesr, it is safe to concluds that all onr snrplns wheat will bs wanted abroad at prices remnnsratives to tbs farmere. Ths market ontlook was probably nsver bettsr than at preeent—not exciting, but assuring.

Ths shipping prospecte ars spparsntly in keeping with thoss of the market prices. Ths agitation of this subjsct was commenced by ths Grangss, bsfore ths seed of the present crop hsd gsrminsted; and the growth and development of thie agitation hss fully kept pace with that of the crop to which it relstsd. They have alresdy chartered a eufficient amount of tonnags to prsvent monopoly in moving the present crop. Msny have seemed to really belisvs thst if our wheat was not to bs shipped by certsin psrties, it would not be ehipped at all, and would remsin an "elephsnt" on ths hsnds of ths California farmers. This delnsion is being rapidly diepelled, for that portion of the press which judges ths Order by its fmits alone, are free in their acknowledgmente of its efficiency in this direction. Thsy declsre thst ths effect of ths movsments of ths Grangss on the wheat msrket will bs to redncs ths multiplicity of commissions, and to estsblish a scals of freights which csn not bs excesded, no mstter what ths advancs in forsign prices for whsat may bs. It ie well known that thsrs is enongh chsrtsred tonnage dus hsrs within the next forty or fifty daye to fmpart s hssIthful sctivity to the shipping movsment.

With the prospect that ths immense enrplns of whsst—over 600,000 tona—is to reach a msrkst whers it is wanted at fair pricee, without being enbjected to nndus speculation, should infnse nsw hops and confidence into the hearte of our farmers. It will undonbtedly produce thie effect; and the monsy which the returns from ths preesnt crop will infues into their pockets will placs them in a finsncisl condition which will snabls them to condnct thsir operations for the coming ysar with still grestsr profit.—*Pacific Rural Press.*

Coal at Eureka.—The Enreka *Sentinel* eaye: For ths lsst few daye thers hse been much troubls hstween eome of ths lssding coal men and the Richmond compsny. Ae ws understand the case, the company has declared all contracts for coal off, and this, ae might havs been anticipated, opsrated to exasperste ths contractore. A great deal of bad feeling has been engendered, and several enits for damage are threatened. The idea of the compsny esems to be to crush out the "middle men" and purchaee coal direct from those who prodnce it. The coal msn were to have had a meeting last night to consider the qnestion in all its bearinge, bnt aa they declins to psrmit the presencs of our rsporter, we can not eay what was accomplishsd, if anything. If, ss tbey claim, the company ie attempting to ignore exieting contracts, both verbal snd written, iu open violation of long established custom, not to say law, there wonld appsar to be very good grounds for their complaints. Howsver, as there are two sidee to all questions it would psrhape be as well to snspend judgment nntil the metter at iseue shall have been mors fully developed. Thoee concerned, ws hope, will at all evsnts bs governed by moderation in all they do in connection with this knotty queetion. The businees of the town languishes to some extsnt in consequence of this sqnabble, but this state of affairs can hardly sndure long, as the Richmond has on hand only abont four days' supply of fusl.

The Dunderberg.—The Eurska *Sentinel* of ths 19th saye: The Dnnderberg, aituated on Prospect mountsin and owned by the Rnby Consolidated company, will to-day be closed down to admit of extensive improvemsnts about the hoieting worke. New and much heavier machinery is to take the plsce of thst heretofors in use. The gsneral plan or method of working ths mine is also to bs materially changed. It is thonght it will requirs about six weeks' time to complete these improvements, after which active work in the mine will bs resumed for the eeason. The new boilor is to be tubolsr in shaps, 16 feet long by 48 inches in circumfersncs, and 40-horse power. The engins will have a 12-inch cylinder, a 24-inch stroke and link motion, which will allow of ite being worked both ways. Ths nsw machinsry ie to be placed on ths hill immediately northwest of the present hoisting works.

Since January last 65,000 bara of hullion have been shipped on teams from Cartago, Inyo conty. The teams take 400 bars every day, which is about the number turned out by ths Csrro Gordo furnacee.

Useful Information about the Pre-emption and Homestead Laws.

A correepondent of the *Bulletin* writss to thet psper ae follows: "Conld yon, thronph the msdinm of yonr paper, put me and many othere right with regerd to ths pre-smption lsw? Quite a nnmber of eettlsre ars now in occupation of unsnrvsyed lands. Thers is a prospect of thsir bsing snrvsyed thie fall, bnt it will bs too late to bs of any esrvice to thoss who deeire to prs-smpt—if, se some enpposs, the law sxpires in September next. With regsrd to this, howsver, opinions differ. Soms msintsin that no legislation hss sffectsd the existing law, and othere eay it expires in Septsmber next. Snch information as ie in your power to impart will be thankfully receivsd."

In reply to the abovs ths *Bulletin* eeys: We snpposs our correepondent hee rsfsrence to a homssteed bill which wes hsfors Congrese at ths laet ssssion, and which wonld have abolished ths pre-emption laws. Thst hill nevsr becams a lsw; it passed ons houss and failed in the other. It originated with Drummond, Commissionsr of the Land Offics, who has since gone ont of office. It ie donbtfnl now if ths bill sver geta throngh Congrsss. The only good pnrposs which the bill involved wae the dedicstion of the entire body of public lands fit for agricnlture to homesteade. But ths law, as it now stsnds, securss practically ths eame resulte. No lands fit for tillsge are sold excspt to actnsl ssttlsrs. Thsre is, howsvsr, still grsat dsnger that large bodies of lsnd may bs granted to corporations. The effort to securs ench a rssult at ths last ssesion was bscked by ths most powsrful combination of corporstion capitalists ever known in ths conntry. Ths effort will be renswed at the next session; in ths meantims, we shall havs ths ususl number of platform reeolntions againet the meaenre, hut no calling to account by conetituents of their membsrs of Congrsss who go directly agsinst the tenor and epirit of thsir declsrations.

Ssttlers on unenrveyed lands havs *three months* in which to fils thsir declsrations, after the lsnd has besn surveyed and ths plats filed in ths office of the Snrvsyor-General. Thst officer not only gives notics throngh ths pspers, as requirsd by lsw, but ths Registsr and Receivsr at ths District Lsnd Offics tsks paius to inform all persons whom they know or hsvs reason to belisve are occupying pnblic lands in ths limits of ths eurveysd township. They send a printed circnlsr, with the nsms of the eettlsr filled in to the following effect:

Notice to Pre-emptors.

A. B.—Ths plst of Township 10 North, Rangs 8 West, Mt. Diablo meridian, hss this dsy been filsd in ths U. S. Land Offics, at Sen Francisco.

Persons clsiming the right of prs-smption on lsnds within ssid township ars required by law to file thsir declaratory ststements in this office befors ths expirstion of thrss months from this dats.

If aettlement is mads after ths filing of the map, the declarstions mnet bs filsd within threa months from said settlement. A nsglect so to fils may prejudics ths prs-emptor's rights ae sgainst olaimante nndsr other lawe whoss splications ars filed within ths said thres months.

H. G. R., Register.
C. H. C., Recsiver.

U. S. Lend Office, San Francisco, Cal.,——, 187—.

Pleass ehow this notice to yonr neighbors.

It may be noted, further, that psreons occupying laud, expecting to hold it for homestead purposes, acquire no right except what might be called the eqnity of eettlsment, until ths declaratory statemsnt has besn filed. Nor dose the time (fivs years) begin to run until such statsment has been filed. Ths occnpant has gained nothing up to that time except tbst his poesessory right while in occupation is good as against any outsider who is sseking to hold in the eame way. The Government has a right to appropriats such possssssory holdings to its own special use at any time, and it may do this without giving the occupant the fonndation of any claim whatever. Thus, whsn Congrese granted to certain railroads tracts of public lands, no notice was tsken of that class of settlers who were merely occnpying public land without having filed any pre-emption or homeetead declaration. They were compelled either to bny of the railroad at the ratss fixed by the company, which ranged from $2.50 to $10, or, being on the even sections within ths lines, they ocnld only bny of the Government at ths maximum rate of $2.50 an acre. Thsrs were many msn in this predicamsnt who had besn cultivating farms for 10 years or mors. Some of them had never had an opportunity to fils declarations becanse no surveya had been made. Bnt in a majority of cases the failure resnlted from sheer careleseness.

And this leade us to note another fact. There ars now lying in the District Land Office of this city 1,200 patente for lands, mostly for farms. Every one of thsse patents ought to bs taken ont and recordsd in the several counties where the land is sitnatsd, at once. Soms of the owners probably do not know that their patents are there. Bnt more do know; and thsy have been contsnt to let thsm rsmain thers, becanse heretofore pnblic land was not enbject to a State tax. The owner of ths patent wae therefore content to have hie patent qnistly tncked away, eo long as he could escaps taxation.

Hundreds havs avoided paying taxes this way. But now the law with respect to taxation is changed. Possessory rights are now taxed, having a real, tangible property vslnstion. Beeidee, msny of the County Aseessore havs adoptsd the plen of eending to the district lsnd officss to inquire if lsnd-holdsrs have petents thers, end, thees being found, ths aeeeesment ie lsid precieely as if ths pstent had been recorded in ths county records; that is, more than ths possesseory valnation ie pnt npon the property. Thers is now, thersfors, no gsin in witholding patents from record; bnt the rieks ars rnn on msny, and onght not to be encountered by any prndsnt land-holder.

Ws go bsyond ths inquiries of a "Snbecriber" to meet othsre, and enmmarize ths following facts: Thers are two classse of pnblic lsnds—one designsted es minimnm, rated at $1.25 an acrs; ths other, dssignated as donbls minimnm, rsting st $2.50. Titls may be ecqnirsd in fonr ways, viz: hy pnrchses at pnblic sels, by privats sntry, by prs-smption, and undsr ths Homestead Act. The first two ways are almost inoperetivs in California, heceuse no pnblic salee ars now made except now and then a "reservstion," and ths lsnd heretofore msrksd "offered" has nesrly all bssn taken np which hae any vslne. Psyments may he msds for public lande in land warrante, bnt these warsnts will only be rsted at $1.25 an acre; all sxcess, ss in the casse of a donble minimnm must bs psid for in cash (greenbacke of conree). Ths total feee to bs paid in aoqniring a homestssd title amonnt to $22. The fece for locsting on a lsnd wsrrant—160 acrss—amonnt to $4, not inclnding ths fees for filing a prs-smption declaration. Agricultural college script msy bs used to locats public lands enbject to private entry in nearly the ssme msnner se soldisrs' land warrants. But in the cses of the formsr only thres sectione can bs taken in any ons township of lsnd. If a eettlsr, having mads hie declsratory etatsment, and being a *bona fide* rssident of the lsnd, ehould die, his executor, administrstor, or heirs osn procesd to perfect the titls; the sntry in that caee, being mads in ths nams of ths hsirs, the patent will be fesued to them.

Co-operative Mining.—A correspondent of the Nevsda *Transcript* eays: I ses thst a movs in ths right dirsction in regard to working onr minss by oo-operativs companiea hae bsen made. The wonder is that snch a plan of working has not been thonght of befors. While we csn jnstly boast of having the riohest and moet extensivs minee of gravel and qnartz to be found on ths coaet, with every fscility for working them to advantsge, it ie a notorione fsct thst may msn ars conetsntly idle for wsnt of employment, and hence ars unable to pay their bills when due, when thsrs are hnndrede of good mines lying within a radius of fivs milee of thie city thst wonld pay good dividends, and givs smployment to all hsrs and many more, wers the co-operativs plsn generally adopted. I think we havs dependsd too much on ontsids capitsl, and not enough on our own exertions. We do not need monsy from San Francisco, and wonld get slong better without snch hslp se their capitsliste generally render us. Merchants and laboring men havs tsken nearly sll the chancee so fsr, and in too msny csses San Frsncisco capitalists havs rstirsd from bueinsss hers, forgetting to pay their bills. There is plsnty of room in thie conuty for a dozen snch companies, and with propsr mansgement and systemstic work, thsy cannot fsil of making a grand succese.

Consolidated Virginia Improvements.—Ths Coneclidated Virginia mining company are pushing the work of grading the site of their new mill, day and night. They ars now smploying at that point—ontside of the mine—about 200 men. Near where the nsw mill will stand they havs erected a two-atory frame building, which will bs used ae a sort of machine shop. It will contain two wood planing machinss and machinsry for doing other work that will bs required abont the new mill. Near this shop has been put np a large temporary ehed, under which a largs force of carpentsre and millwrights are at work at framing timbere. Sonars timbers and lumber of all kinds are oonstantly arriving by rail, also large lots of machinery from San Franoieco. A side track from ths Virginia and Truckee railroad rune along the west front of the eite of ths nsw mill, therefors all the lnmber, machinery and materials of every description requirsd in ite construction can bs bronght npon the ground by rail. The neighborhood of the new mill is at prssent the liveliest place in or or about the town.—*Enterprise.*

Idaho Mines.—The *Statesman* is informed thet the Gold Hill mill is working abont 50 men, and the mill is ponnding away with as good success as usnal. The Hawley or Idaho company have pnrchased the Tom Hart mill, formerly located at the Lawyer lsdge, and now have it moved on to the Iowa ledge, and are pntting it up with the intention of having it rnnning by the 10th of next month. They have 1,000 or 1,500 tons of ore out, and havs a small company of men stoping and taking ont mors rock. This mill will give considsrable new lifs to the camp, when they get fairly nnder wsy. Ben. Wilson, at Pioneer, hae been engaged for some time past etripping whst ie known as ths Slnm Gullian olsim, finding splendid prospects, and ie now washing np the gravel.

The newly developed qnicksilvsr minss in Lake, Napa, Sonoma and adjoining conntiss are drawing to them a large and active popnlation, and new towns are bsing built in all directione. Those ocnntiee present at this time a wonderfnl degree of activity and proeperity.

MECHANICAL PROGRESS.

Tin Plates.

From a paper recently read by Mr. Speakmaa, of Philadelphia, we obtain the following description of how tin plates are made:

After the sheets are cut down to size for tinning they are separated from each other by what is called opening; during the process of opening "stickers" and imperfect plates are thrown out, and the passed sheets then go into the pickling room. There they are put into a hot pickle of dilute sulphuric acid, to be cleansed from oxidized and silicinus matters, and undergo another rough examination in the scouring process; that is, any plate not cleansed is rubbed with sand in water. Defective sheets are again thrown out, and the plates are now passed into the annealing room.

The plates are carefully annealed and are then submitted to a hot but more dilute pickle of sulphuric acid, and again chemically cleansed; taken from the acid bath they are well washed in running water, and kept in clean water until the tinman is ready for them.

The tinman takes the plates from the waterbath (where they lie some hours) and plunges them wet into a bath of hot palm oil, called the "grease-pot." When they have acquired the temperature of the grease-pot, they are removed with tongs and quickly submerged in a bath of tin. The oil mixed with the water from the plates floats at the top, forming a flux which covers the melted tin and prevents oxidation. With the tongs, the sheets or plates are continually kept moving and separated, to insure the tin getting between all of the sheets. When the bath has recovered its heat, which it generally does in about half an hour, the tinman examines the charge, and if he finds that perfect amalgamation has taken place between the two metals, he removes them with a tongs to the next bath, which is kept at a low temperature.

The temperature raised by the change from the "tin-pot" is again allowed to cool down to a few degrees over the melting point of the tin, when the plates are taken in lots of a dozen or two at a time, and laid on an iron slab which is at the side or head of the pot. The waste metal and grease run back into the pot, the slab being inclined. The workman then takes up sheet by sheet with the tongs, and dips each into another bath of fine metal kept at a heat a little over melting point, immediately withdraws it, and places it in a rack immersed in a large pot of melted palm oil kept at the proper temperature, where they are allowed to remain certain time. The sheets are then slowly lifted out of the grease by a boy, who separates them into proper lots by counting carefully, regulating the intervals of time between them. The grease recoils from the top plate, and, as little is left on the sheets, they are again placed in a rack in the open air to cool; when cool a lad takes each sheet in a tongs, and dips the lower edge into a small bath of melted tin so regulated that the sheet can only enter to about the eighth of an inch. It is kept long enough to melt off the drops of metal which adhere to the lower edge, and when lifted the sheet is struck to throw off the superfinous metal from the edge. The plates are again put into a rack, and taken while warm to a bin of bran, where each sheet is thrust into and under the bran, to get rid of the grease which adheres. It is then passed on to a second and third hand, when the grease is pretty well behind in the last bin, which is kept filled with new bran. The sheets are turned out covered with flour dust and bran, and dusted off with cotton shaggy cloth.

The next process is in the sorting room. Here the finished sheets are laid on tables, and each sheet undergoes an examination by the sorter, who throws out those shearings which are defective in the iron or trimminge. The latter are reheated to regain the tin; the imperfect sheets are sold as "wasters" at a less price; the sheets are counted, and the box of 100 lb. weight is composed of 225 sheets of 14 inches by 10 inches, for home use or exportation.

NEW BRITISH STEEL GUNS.—For some special purposes a very light arm is required, as, for instance, where field-guns have to be carried over mountainous country, as also for arming the steam launches and pinnaces carried by iron-clads, and it is to supply this want that the steel weapons have been designed. They weigh but two hundred pounds each, and can, therefore, be carried on a mule, or in the prow of a boat, without inconvenience. Being bored and fashioned from a single block of steel, the utmost strength has been obtained, the weapons being, moreover, tempered in oil to harden them as much as possible, after attaining to the proper caliber. The bore of the gun is thirty-six inches long, and the diameter of the projectile that it fires is four inches. The utmost range of the new arms is stated to be four thousand yards.

UP to a recent date, the Westinghouse brake has been under the exclusive control of the engineer; now it can be applied to the entire train by any person in any car; while the train, in case of derailment, also applies the brake to itself, adding an immense impeding force to the obstacles which it otherwise encounters.

IN Maine, the building of three-masted schooners is increasing. These vessels are, on the Atlantic coast, fast superseding other kinds of vessels. They are built cheaper, consequently there is more profit in their construction.

Transmission of Power by Wire Ropes.

At a meeting of the Institution of Mechanical Engineers, London, Mr. Morrison described the mode of transmission introduced by the Bros. Hirn, and now extensively used on the Upper Rhine. It appeared that they first used flat metallic bands to transmit the power; but, these being found objectionable, round wire rope was subsequently adopted, instead. The rope is usually made of fine steel wire, as it must be very tough and flexible. The wire rope, which is about one inch in diameter, and contains 72 strands, is run at a high velocity, over pulleys of large diameter. The total loss of power by friction, etc., was stated to be 2½ per cent., and it appeared that, of 120 horse power existing at the motor wheel, 100 horse power was utilized at 2,200 yards distance; but it could not be elicited in the discussion how these figures had been arrived at. It was also estimated that iron shafting, capable of transmitting the same power, would involve the use of 3,000 tons of material. Various materials were tried for facing the grooves of the pulleys, such as copper, leather, etc., as there either was excessive wear in the groove, or the facing destroyed the rope. The best arrangement was found to be a dovetail groove, filled in with gutta-percha, in which the rope soon made a channel for itself, after which the wear was not excessive. The pulleys run at the rate of 50 miles per hour, and the ropes last from one and a-half to two years.

Dr. Siemens remarked that there was no doubt that, by running ropes from 30 to 60 miles per hour over palleys, a large amount of power could be transmitted with but little waste.

Mr. Wm. Smith said that in 1837, soon after his father had invented wire rope, it was used very similarly, and in 1839 and 1840 it was introduced on the Regent's canal, for towing barges through the tunnel beneath the Herrow road, and it was also taken three and a-half or four miles along the bank of the canal. The bargeman simply threw a catch line over the running wire, and let go when necessary. It was tested against the screw, duck-foot propeller and others, but was not found to be economic. He had many times seen a similar application of the principle; the fly-rope of an ordinary ropery was an illustration, but that had long since been obsolete. He would like to know whether the paper claimed, as a novelty, the introduction of endless wire ropes for transmitting power to a distance; if so, he doubted whether the claim could be substantiated. If the novelty merely consisted in the running of the ropes at a high velocity, which was all he could see in it, there might be something in the claim.

CASTING IRON IN SAND MOLDS.—In Fairbairn's *Iron Manufacturer* we find the following account of the first successful attempt in England to run cast-iron in molds of sand: In 1706, John Darby, one of the four partners of the brass works known as Beptist Mills, at Bristol, England, conceived the idea that cast-iron might be substituted for brass, and prevailed upon some of the workmen to try and make iron castings in molds; but they failed, and considerable loss was incurred in their experiment. A young Welsh apprentice, who had been a shepherd-boy, came into the employ of the Darbys. As he was looking on during the trial of the Dutch workmen to cast iron, he said to Abraham Darby that he thought he saw how they had missed it. He begged to be allowed to try, and he and Abraham Darby remained alone in the workshop, the same night for the purpose. Before morning they had cast an iron pot. The boy Thomas entered into an agreement to serve Abraham Darby and keep the secret. For more than 100 years after the night in which Thomas and his master made their successful experiment of producing an iron casting in a mold of fine sand, with its two wooden frames and its air holes, the same process was practiced and kept secret at Colebrook Dale, with plugged key holes and barred doors.

COAL-CUTTING MACHINES.—In the course of a paper on coal-cutting machines, read at Bradford, by Mr. Firth, mention was made of the extraordinary power of these machines in dispensing with hand labor. One man, a youth, a boy and a machine, can compass the work of twelve men, thus reducing "that hard physical labor" by seventy-five per cent. Moreover, the machine in use at Ardsley showed great power in grappling with a difficult seam, and reduced the cost of production by 1s. 7d. per ton. The rapid introduction of coal-cutters seems to promise a revolution in the coal trade, and will doubtless present an additional indncement to the many capitalists who are now devoting their energy and their cash to the opening-up of new pits.—*English Exchange.*

THE smallest steam engine on record was made by a Scotchman, named Crawford. It is perfect in every part and so small that it can be covered by a lady's thimble. It can be worked by steam, but he usually works it by atmospheric pressure, through a flexible tube, with rubber air receiver. The pet engine was made as an amusement, and to show what could be done. It is undoubtedly the smallest working machine ever made.

STOPPING BOTTLES.—A new invention consists in attaching india-rubber tubing to the neck of the bottle, said tube being bent over and secured in that position to close the neck of the bottle.

SCIENTIFIC PROGRESS.

Remarkable Motive Power.

A curious capillary experiment was devised by M. Lippmann some months since, which the author has recently utilized in a very ingenious way. The original experiment is thus described: Place in a saucer or in a large watch-glass a globule of mercury and inch or two in diameter, and pour upon it a little water acidulated with sulphuric acid and slightly colored with potassium bichromate. If now the mercury be touched laterally with the point of a needle, the globule will be observed to contract and withdraw itself from the needle, then to extend again to its primitive position. This brings it again into contact with the needle, the contraction is renewed, and so on indefinitely. When the globule is quite large it executes contorted and grotesque movements which are surprising to those who are not in the secret. The explanation of this phenomenon is found in the fact that under the joint influence of the iron and the bichromate, the mercury is successively oxidized and deoxidized, thereby producing an alteration in its capillary condition and causing the swelling and flattening. This oxidation and deoxidation may also be effected by an electric current. The globule is seen to swell up or to flatten, according as it is connected with the negative and deoxidizing or with the positive and oxidizing electrode. It is this oscillating motion of the globule of mercury that M. Lippmann has utilized in his motor. It is constructed as follows: In a trough of glass two small cups are placed, full of mercary; in each of these moves a pistou formed of a bundle of glass tubes. The trough is filled with acidulated water, and the two masses of mercury are in communication with the electrodes of a battery in such a way that when the one contracts the other flattens. Consequently, when one of the pistons rises the other falls; and by simply transforming this reciprocating motion of the pistons into a rotary one, an electro-capillary engine of some hundredths of a kilogram-metre of power is readily obtained. In the machine actually constructed by M. Lippmann the fly-wheel made a hundred revolutions per minute.

The extremely feeble current needed to set this engine in action suggests its use as an indicator of currents too feeble to be detected by ordinary instruments. Used in this way it would constitute an extremely sensitive electrometer. Indeed it might come in use for the reception of cable dispatches, which, as is well known, are sent by means of very feeble currents. Certain movements of the machine might correspond to certain predetermined characters or sentences, and in this way the dispatch might be easily deciphered. Though scarcely more than curious at present, these experiments of M. Lippmann are exceedingly interesting, and will undoubtedly in the future receive important applications.—*Journal of Franklin Inst.*

CLAY GLACIERS.—The gliding masses of clay, resembling glaciers in many respects, which are to be seen in the vallays of the Apennines, form the subject of a memoir communicated to the French Geological Society by M. de Mortillet. These mountains consist of sandstone, sand and clay. The clays retain water like a sponge, and becoming saturated, take the form of a sort of slippery dough. Then they slide and move like glaciers; the pressure on the clay as it glides along the sides of the valley causes the calcareous debris to rise to the surface, which gives the moving mass a further resemblance to a glacier. Lateral moraines, too, are formed, and along the sides of the valley is found a great accumulation of calcareous fragments. The pressure exerted by these masses is enormous. M. de Mortillet mentions railway embankments of solid construction being swept away by them, the gravelly stratum on which the embankments were constructed being carried off. The movement of a glacier is due solely to the pressure of the higher portions of it upon the lower, and its progress is in proportion to the weight of the mass above. Glaciers are plastic, it is true, but they can not be said to flow.

NATURE OF ELECTRICITY. — Attempts have been made to combine the wave theory of light and electricity by supposing that the vibrations of the ether which produce the phenomena of electricity are longitudinal, resembling those of sound, while the phenomena of light are produced by transverse vibrations of the same medium. Another theory which has been long believed, is that electricity consists of two fluids, and that a body is electrified positively or negatively, according as one or the other of these is in excess. According to Dr. Franklin's theory, there is a single fluid and the phenomena depend upon the excess or deficiency of this fluid. About three years ago, Professor Edlung read a paper before the Swedish Academy, in which he advanced the theory that this single fluid was the ether by whose vibrations light is produced; a body being charged positively when it contains an excess of ether, and negatively when the ether is deficient.

SUGAR CONTAINED IN VINE LEAVES.—Petit, the author, finds that grape leaves contain from 20 to 30 grms. of glucose per kilogramme, and from 13 to 16 grms. of acid, of which one-third is tartario acid, mostly existing as bitartrate of potash. Grape leaves contain cane sugar as well as glucose.

Atmospheric Dust.

Among the conclusions reached by Mr. Cunningham, of Calcutta, in an elaborate series of microscopical examinations of atmospheric dust, are the following:

Specimens of dust washed from exposed surfaces cannot be regarded as fair indices of the constituents of atmospheric dust, since they are liable to contain bodies which may have reached the surface otherwise than by means of the air, as well as others which are the result of local development.

Specimens collected by gravitation also fail to indicate the nature and amount of organic cells contained in the atmosphere, as the heavier amorphous and inorganic constituents of the dust are deposited in relative excess due to the method of collection.

Dew also fails to afford a good means of investigating the subject, as it is impossible to secure that all the bodies really present in a specimen of it should be collected in a sufficiently small space, and, moreover, because it is liable to accidental contamination, and also affords a medium in which rapid growth and development are likely to take place.

Spores and other vegetable cells are constantly present in atmospheric dust, and usually occur in considerable numbers; the majority of them are capable of growth and development; the amount of them present in the air appears to be independent of conditions of velocity and direction of wind; and their numbers are not diminished by moisture.

The amount of inorganic and amorphous particles and other debris suspended in the atmosphere is directly dependent on conditions of moisture and of velocity of wind.

NEW EXPLOSIVE.—An English inventor has taken out a patent for improvements in explosive compounds, in which he uses sawdust, spent tan, etc., freed from impurities, and submerged for a few moments in nitric or sulphuric acid, and mixed with certain nitrates. The tan, etc., when prepared, is termed the wet incipient compound, and to form explosive compound No. 1, 40 lb. of this is mixed with 60 lb. of nitrate of baryta, ammonia, lead or strontium. To this mixture is added 5 lb. of nitro-glacerine, absorbed by fine dry sand or infusorial earth, 20 lb. of soft wood charcoal or coal, 10 lb. of chlorate of potash, and 5 lb. of sulphur. The whole is then dried at a temperature of about 90 deg. to 100 deg. Fah. For compound No. 2, 57 lb. of spent tan are mixed with a boiling saturated solution of nitrate of baryta, soda, etc., 15 lb. of sulphur, and 6 lb. of chlorate of potash, and dried at about 212 deg. Fah. Compound No. 3 contains 70 lb. of nitrate of baryta, 12 lb. of anthraoite, sea-coal or soft wood charcoal, 7 lb. af nitrate of potash, 6 lb. of loaf sugar, 6 lb. of sulphur and 2 lb. of chlorate of potash, first crushed and then mixed together. The mixture is then damped with ordinary glycerine, sufficient to make its various parts cohere, and dried at about 212 deg. Fah.

GAS PRESSURE ALARM.—When two neighboring buildings are illuminated by gas derived from the same source, it frequently happens that the extinction of the lights in one building causes the pressure of gas in the other to become greatly increased, and sometimes to result in accident. M. Launay proposes, as an alarm to give warning of this over-pressure, a bisulphate of mercury battery, in which the liquid is in communication with the gas by means of a siphon, so that the pressure of the gas in varying, rises or lowers its level. If its pressure is above a certain fixed limit, the liquid is raised so as to come in contact with the metallic portion of the battery, establishing a current which sounds an electric alarm. M. Lsunay also suggests that a simple method of determining leaks in gas pipes throughout a building is to force some strongly odorous smoke into the supply pipe. The fumes of incense, for example, escaping in any room, would be readily distinguished from gas, and the locality of the leak quickly found.

CHINESE MIRRORS. — The curious property possessed by Chinese metal mirrors of reflecting figures put upon the back by way of ornamentation, has long been a matter of wonder to persons ignorant of the reasons for the phenomenon. Their manufacture is described as follows: Chinese mirrors are castings of a somewhat porous alloy. Before the reflecting face is finally polished, it is laid on an anvil, and the embossed designs or figures at the back well hammered. This, of coarse, condenses and closes the pores of the metal in these parts, and, in consequence, when the face is finally polished, the metal in front of the design has its power of reflecting light increased, and so gives rise to the fallacious idea that the pattern shines through the metal.

VASELINE.—The new product of petroleum to which this name has been given promises to come into use as a vehicle for various emollient preparations, for which it appears to possess some peculiar advantages. It is a solid, semi-transparent jelly, neutral, and free from taste or odor, and it is said to undergo no change by keeping. It becomes liquid at a temperature of 95° Fahr. The manufacturers state that it is prepared simply by the evaporation of crude petroleum, and filtering the residue through animal charcoal.

M. BERTHELOT has recently succeeded in producing nitrite of ammonia for the first time in a crystalline state.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

Mining Stocks.

There is nothing much of interest to report in the Stock Market, as prices continue low. The Comstock mines are all looking well, and many of them are not only meeting with good indications bnt are also finding good ore. Prominent fluctnations in price have been as follows: Eureka Cons. varied between $10 and $12.50; Meadow Valley, $4.50 and $6.50; Golden Chariot, $6 and $8.25; Belcher, $63.50 and $68.75; Best and Belcher, $23.50 and $25.50; Caledonia, $15 and $17.50; Chollar, $47.50 and $55.50; Cons. Virginia, $81.50 and $83.50; Crown Point, $66.50 and $70; Dardanelles, $9 and $12; Exchequer, $59 and $63; Gould & Curry, $17.25 and $20.50; Hale & Norcross, $40.50 and $50.50; Kentuck, $12.75 and $14.25; Knickerbocker, $3 and $5; Ophir, $16.25 and $18; Overman, $27.50 and $33; Savage, $50 and $80; Seg. Belcher, $70 and $83; Yellow Jacket, $71 and $79.

Prominent advances over highest prices of last week were as follows: Best & Belcher, $1.50; Cons. Virginia, $1; Dardanelles, $2.50; Gould & Curry, $1; Knickerbocker, $1; Seg. Belcher, $9.

The declines were more nmmerous and were as follows: American Flat, $1; Belcher, $5.75; California, $1; Chollsr, $6.50; Crown Point, $8; Exchequer, $1; Kossuth, $1.12; Yellow Jacket, $2.50; Eureka Cons., $1; Meadow Valley, $1; Raymond & Ely, $1.50; Eureka, $1; Empire, $1; Ida Elmore, $1.

MINERS at the Omineca mines are said to be making large wages.

New Incorporations.

The following companies have filed certificates of incorporstion in the County Clerk's Office, San Francisco:

FLEETWOOD QUICKSILVER M. Co.—July 23.—Trustees: R. R. Craig, S. G. Thompson, Wm. R. Williams, James B. Cooper and Charles E. Buckingham. Capital stock, $3,000,000, in 30,000 shares.

BLUE JACKET QUICKSILVER M. Co.—July 23. Location: Sonoma Co., Cal. Trustees, J. W. Jackson, Lewis B. Harris, Frederick Clay, Chas. L. Sell and W. J. Dakin. Capital stock, $3,000,000.

BERKELEY FERRY AND RAILROAD Co.—July 23. Object: Constructing or buying ferry boats to run between San Francisco and Berkeley, and to build a street railroad from ths westerly end of University avenue to the grounds of the State University, near the College of Arts, and lateral branches thereof, not to exceed a total length of 10 miles. Directors: F. Chappellet, Henry Durant, A. Moore, A. Rammelsberg, S. A. Penwell, H. T. Graves and W. W. Spaulding. Capital stock, $10,000,000, in 20,000 shares.

POTOSI MINING AND SMELTING Co.—July 27. Location: Cerro Gordo District, Inyo county. Directors: J. A. Pritchard, V. H. Vaughan, T. Hardy, Henry Raymond and John Simpson. Capital stock, $5,000,000.

NORTHWESTERN QUICKSILVER M. Co.—July 27. Location: Lake county. Directors: B. M. Hartshorne, E. J. Weeks, A. H. Harris, J. C. Hanscom and R. M. Wilson. Capital stock, $5,000,000.

PACIFIC MILL AND MINING Co.—July 29. Location: Nevada. Directors: W. S. O'Brien, J. C. Flood, Joseph G. Fair, John K. MacKay and Edward Barron. Capital stock, $8,000,000.

Meetings and Elections.

DARDANELLES M. Co.—July 23. Trustees: J. J. Robbins (President), S. C. Theller, C. C. McCracken. W. S. Duval was re-elected Secretary.

UNION CONSOLIDATED M. Co.—July 23. Trustees: Robert Sherwood, (President), J. R. Keene, J. W. Coleman, J. S. Follansbee and J. P. Cavalier. J. M. Buffington is Secretary and S. L. Curtiss Superintendent.

YELLOW JACKET M. Co.—Trustees: Thomas G. Taylor, G. W. Hazleton, F. A. Tritle, D. L. Bliss and T. B. Storer.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior in proximity to the mines mentioned:

California.

AMADOR COUNTY.

SALE OF MINING CLAIMS.—*Ledger*, July 25: A sale of valnable placer mining ground has been made by Thomas Sorocco to a gentleman of San Francisco. The claims sold are located in Union fist, nesr Volesno, and are considered very valuable. We understand the claims were sold for $16,000. From all we esn learn and from our personal knowledge of the ground sold, the purchaser has obtained a good bargain.

GOVER MINE.—Reports from this mine are very favorable. At a depth of 600 feet, a drift has been run across the ledge to the hanging-wall, s distance of 40 feet. The whole of the ledge, vast as it is, will pay good returns for milling, while about four feet in thickness, next to the hsnging-wall, the rock is represented as being of very high grade.

RICH ROCK.—*Dispatch*, July 25: We were shown a few days ago some splendid looking rock, recently taken out of a new qnartz mine on Murphy's ridge, and now being developed by Messrs. McKay, Love & Co. The company have been engaged for several months past in running a tnnnel into the ridge, bnt we believe they have not yet had any of the rock crushed. The prospect, however, looks decidsdly encouraging.

CALAVERAS COUNTY.

WEST POINT DISTRICT.—*Chronicle*, July 25: Hoisting works are being erected at the former Big Flat mine by S. Haskins & Co. An overshot wheel is in position to furnish the motive power. When worked, heretofore, the ore extracted from this mine never yielded less than $100 per ton. The Trip Hammer mill of the Ohio suspended operations temporarily. One of the balance wheels broke and the battery mortar appears to be too wide for profitsble work. The Tolman & Miller mill and mining company hss been incorporated. The mine is situsted about three miles east of West Point. The msin ehaft is about 50 feet in depth, tapped by a short tunnel which drains the snrface water. The lead is of fair size and asssys well, but no levels have been run as yet. The vein wss worked superficially, in former times for a considerable distance with uniform healthy net results. The Zacatero mill has not commenced crushing yet but will undoubtedly next week.

BLUE MOUNTAIN.—A team heavily loaded with machinery passed through town, a few days ago, en ronte for Blue mountsin. The machinery was designed for the extension of the Heckendorn mill, together with new appsratus for putting in operation Mr. F. Smith's process for working sulphnrets.

SAN BRUNO ROCK.—We have seen specimens of the rich ore recently struck in the San Bruno mine at Mosquito, and are prepared to testify that the reports concerning it do not exaggerate the truth. The rock is fairly cemented together with the precious metal. In fact, the specimens are about the handsomest and richest we ever saw.

EL DORADO COUNTY.

QUARTZ.—*Mountain Democrat*, July 25: Fox & Russell, of Garden Valley, are prospecting a vein of quartz, whioh is undonbtedly a continnation of the esme ledge on which the shaft of the Taylor mine has been snnk. The rock shows plenty of free gold and at the snrface is quite soft. They have sunk to a depth of thirty feet, and bave been amply repaid for all work that has been done.

THE ehaft in the Naper mine, Poverty Point, has heen cleaned ont and thoroughly timbered. Sinking commenced last week, and the rock now being taken ont looks well. It is good for from $50 to $75 per ton.

LASSEN COUNTY.

PLACERS.—Butte *Record*, July 25: Parties have struck very rich placer mines in the hills above Mountain Meadows, Lassen county. It is said that the deposit is quite extensive, and several claims have been taken up with first-rate prospects.

NAPA COUNTY.

MINING PROSPECTORS.—*Reporter*, July 25: For a week or so hack, a party bave been diligently engaged in tracing up a piece of float cinnahar rock to the main ledge, if there be any sucb, in the hills to the east and above Napa City. Good indications have been fonnd in Foss valley, and it is thought that the rock spoken of oame from the same lsad bearing from thence in the direotion of the Vallejo quicksilver mines.

NEVADA COUNTY.

DARTMOUTH.—Grass Valley *Union*, July 28: In the Dartmouth gravel mine a quartz ledge has been strnck by the miners, which shows well in heavy sulphnrets, galena and good general appearance of live quartz. This strike was unexpected, and another ledge is known to exist in the Dartmonth grondo. To prospect a mine here is success.

A NEW MILL.—The Eagle mine, now the property of the Oakland Gold & Silver Mining Company, located in Indian district, is to have a mill for the reduction of its ores. The mine is now sufficiently developed to justify its owners in assuming this expense. The mill is to be of fifteen stamps crnshing capacity, with all the modern improvements for working ores.

OMAHA MINE.—The ledge in the north drift of the Omaha is about a foot thick and shows rich rock, not in spots but wherever the ledge has been uncovered. In the south drift the ore is fair and will pay for mining and milling and will then give a profit over. The Omaha's prospects are more than fine.

NORMAN.—Some few weeks ago a tunnel was started on this claim for the purpose of tapping the ledge at greater depth than in the shaft, and also to facilitate the working of the mine. On last Saturday a very good ledge was struck in this tunnel, hut, being very near the surface, the ore streak is not so large nor rich as in the shaft. The owners, however, are well satisfied with their prospect.

PLACER COUNTY.

ORLEANS.—*Herald*, July 25: We learn from Mr. Gordon, that the blast which was being put in at the time the accident occurred, last Tuesday, knocked off some of the richest rock, in appearance, yet found in the mine. There is one characteristic about this mine which adds greatly to its value; that is, the unusual width of the pay chute. At a depth of about 70 ft they have already run horizontally 180 ft. through pay rock all the time; and instead of showing signs of pinching out, or becoming barren, the ledge maintains its full width of 4 ft., and from what Mr. Gordon says about the development of this last blast, is growing richer.

TWO MILLS.—Thomas H. Gordon, owner of the Orleans mine, has leased the Greene mill, and intends starting it on Orleans rock, next Monday. He has had the Eclipse mill pounding on rock on this mine, but it, alone, is too slow for the industrious Thomas; so, hereafter, both of these mills will be run steadily on Orleans rock, until that big pile of rich ore, now on the dump at the mine, is crushed.

WHY DID THEY STOP?—Some time ago work was suspended on the Auburn mine, and the property apparently abandoned. A few weeks ago the mine and all the things of value thereon, was sold by the Sheriff, to satisfy the claims of creditors. The last few tons of rock taken out was at the dump at the time of the sale and, was bought for a trifle by Mr. T. H. Gordon. Last week Mr. Gordon crushed this rock, at the Eclipse mill, about 12 tons, and greatly to his astonishment cleaned up $25 per ton. The query is now, why did the company stop work? Were they ignorant of the treasure they had in store, or was the abandonment a blind for the purpose of giving a few speculators an opportunity to get hold of all the stock at their own figures? Had they not allowed the mine to be sold, the latter supposition would seem most likely, but as it is, the thing is a mystery. There is a big ledge, and if it pens out to the tune of $25 per ton, the mine is valuable.

PLUMAS COUNTY.

GOOD ROCK.—*National*, July 25: The New York mill, at the mouth of Dixie cañon, recently cleaned up about $2,700 from 18 days' run, crushing 270 tons of rock. The mill is now running splendidly, and the mine looks very promising.

BADGER HILL.—On Tuesday last, in company with a friend, we paid a flying visit to the Badger hill claims, owned by Mr. E. B. Jacks, but now leased to the Plumas Ditch and Mining Co. Leaving our horses in the cañon, we ascend the steep hill on foot, and on reaching the summit we are favored with one of the finest views of a mining claim in "full blast," that it has ever been our fortune to witness. Two large monitors are throwing a tremendous volume of water upon the yielding banks of gravel and pipe clay, one rainbow-shaped stream being fully 300 ft. in length from the nozzle to where it strikes the bank. The working force comprises some 20 men. The bank is 170 ft. high, about 100 ft. clay and red dirt, and 70 ft. on the bed-rock of splendid looking gravel. The two pipes, one 4½ and the other 6-inch, throw 1,150 inches of water, under a pressure of 220 ft. The pipe clay comes down in large masses, and has to be broken up with picks and giant powder before going into the flume. The flume is 700 ft. in length, and passes through a tunnel for some distance. It is provided with the latest pattern of under-currents, and unless the clay "steals" some of the gold, but very little is lost. The water will hold out for some time yet, and as the clean-up, which takes place about every 10 days, shows a yield of from $300 to $500 per day, the aggregate for the season's run will be a very large amount of the precious metal. Mr. Folsom informs us that they will have four pipes next season, with increased water facilities, and, judging from the amount of bed-rock which has been uncovered already, they will make a "big hole" in the claim during the two years' time for which they have it leased. The claim is very extensive, however, and we imagine that a dozen fortunes will be left when the ditch company give up possession.

SAN DIEGO COUNTY.

JULIAN NOTES.—San Diego *World*, July 25: We are indebted to Mr. M. B. Woods, one of the late proprietors of the Ready Relief, for the following Julian notes: Mr. Woods has just started for San Francisco to exhibit some specimens of ore, from mines in the district, which he has recently discovered.

A gentleman named Beaver, German scientist, has found a splendid ledge, which is an extension of the Ready Relief, which has every indication of most promising results. A capitalist named Thomas Finley has interested himself in this new discovery.

In the Chariot mine a large ledge six feet wide has been struck, which is considered far richer than anything heretofore found in that locality.

The Little Joker, which is also an extension of the Chariot, has again developed rich ore. Some 70 men are now employed in developing this new discovery. The ledge has been for some time separated from the main ledge by a slate formation. A junction of both leads has now been found, and the result is most satisfactory.

The Hidden Treasure is also coming up to the mark of a first-class mine. Messrs. Ross & Putnay, who have plenty of means, have a number of men at work upon it now. Mr. Woods exhibited a specimen of rock from this ledge, which certainly looked fine.

The Golden Rule, owned by the "Count" and Mr. Snow, have already reached a depth 150 feet with their shaft. They have come upon an immense body of low grade ore.

On the first south extension of the Ready Relief, Messrs. Atkinson, Allen and Woodruff have their tunnel nearly completed, and are tapping the old ledge at a depth of 200 feet. This accomplished, splendid results are looked for. The "chimneys" from the Ready Relief pitch into this tunnel.

A strong force of men are busily at work on the Atlantic Cable, tunneling, and everything looks bright. Upon this work Mr. R. J. Conners is pushing things with his usual energy.

SAN LUIS OBISPO COUNTY.

THE MAHONEY MINE.—*Tribune*, July 25: We learn from undoubted authority, that Mr. Edward Mahoney, owner of the Mahoney quicksilver mine, in this county, has been offered $100,000 for his mine. It is an English company who are trying to negotiate for this valuable piece of mining property.

SUSPENDED.—Work has been suspended on the Josephine quicksilver mine, by order of Bell & Co. Our estimate of its value has been verified in this order of suspension from headquarters. The mine is a failure and there is no disguising the fact.

SOLANO COUNTY.

QUICKSILVER.—Benicia *Tribune*, July 26: We have been presented by Mr. A. P. Whitman, with several specimens of ore taken by him in a recent prospecting trip, some of which appear to be exceedingly rich. There is scarcely a doubt but that the Solano county foot-hills contain any quantity of this valuable metal, if the capital and labor were united to develop it.

TRINITY COUNTY.

BULLYCHOOP.—*Journal*, July 25: Siegfried & Co. are getting considerable rock out of their quartz mine on this mountain, and it continues to prospect well in free gold. Large prospects are also obtained in the earth below the ledge, which is considered as a very favorable indication. An arrasta is to be put up and a quantity of the rock worked before snow comes.

INDIAN creek miners are cleaning-up with good results. The Sillcox ditch has a full supply of water, but aside from this that element is scarce.

THE mines of the McGillivray company are being run with plenty of water yet. No attempt at a clean-up will be made until water fails. Everything is working favorably and prospects are encouraging.

TUOLUMNE COUNTY.

A RICH MINE.—*Independent*, July 25: On Tuesday, Mr. Le Roy Reed exhibited to us some of the richest quartz specimens we ever saw. This lode was discovered about two years ago in the American Camp district, on the bluffs above the Stanislaus, near Pine Log, about three or four miles northeast of Columbia. Mr. Reed and C. T. Ferrier were the locators, the latter having recently sold out to his partner, and gone north to see the country. It is a pocket lode, and is now down sixty feet, where another rich pocket has just been struck, some five inches in width. There are four chutes on the vein within a distance of 100 feet, and all run at the same angle. The pockets are found from eight to ten feet apart, the longest distance being less than twelve feet. The smallest one yielded $1,600, and from that in various cuts up to $4,000. The rock is gray, and over half mineral, with the gold all through it. It looks like the rock from the silver mine of Knowles & Tullock. Mr. Reed informs us that sometimes the rock is so full of the gold and other minerals that it is impossible to break it, and they have to cut it out with a cold chisel. Where the lode was first discovered on the surface it was a mere thread, but the vein grows larger and richer as they go down on it.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, July 22: Daily yield, 300 tons of ore. The north winze from the 1,300 to the 1,400-ft. level has been enlarged to 40 ft. square, greatly cooling the face of the ore breasts. Sinking the north winze No. 2, from the 1,300 to connect with the 1,400-ft. level is making good headway, the bottom still in ore. Driving the main south drift on the 1,500-ft. level is making rapid headway, following the west wall of the ledge. The heat in this drift is great, and causes slow progress. Preparation for the erection of the new 60-stamp mill goes steadily on.

GOULD & CURRY.—There is no change whatever to report of the prospecting operations on the 1,500 ft. level. Sinking the double incline winze below the 1,700 level is making steady headway. Work in this winze is being pressed with all the vigor possible, so as to enable the opening of the 2,000-ft. station at the earliest day possible, for the purpose of running a south drift from that station to connect with a north drift on the same level from the Savage mine for ventilation purposes.

CROWN POINT RAVINE.—The management of this mine has recently passed into the hands of some heavy San Francisco capitalists, who have again commenced a vigorous prosecution of the work of prospecting the ledge. Recent developments on the 300-ft. level proved the ledge to be from 40 to 45 feet in width, with regular, well-defined walls, and assaying from $4 to $80 per ton.

SIERRA NEVADA.—The completion of the new machinery is being pushed with all the vigor possible, all the men being employed that there is room to work. The new water tanks on the hillside, above the hoisting works, are completed, and the pipes for conducting the water to the works are being laid. The hydraulic is steadily at work, and begins to make quite a hole in the side of the mountain. Daily yield, 60 tons of ore, keeping the mill steadily running.

GLOBE CONSOLIDATED.—The rock in the face of the main west drift, at the 400-ft. station, is working much softer, and admits of far better progress than heretofore. The west drift at the bottom of the winze, from the head of the incline, has developed a fine body of high grade ore, that appears to be improving as the work progresses to the westward.

HALE & NORCROSS.—The ore in the main north drift, on the 2,000 foot level, is showing considerable of an improvement, and promises a development of more value than was at first expected. Daily yield of ore, 40 tons, from the old upper levels.

SAVAGE.—The main south drift, on the 2,000-foot level, to connect with the north drift from the Hale & Norcross on the same level, is making steady progress. A north drift, on the same level, to prospect that portion of the mine, and eventually connect with a south drift from the Gould & Curry, for ventilation purposes, has just been started.

CROWN POINT.—Daily yield 450 tons of ore. The ore breasts on the 1,300, 1,400 and 1,000-ft. levels continue to look well, and yield the usual amount of rich ore. Driving the main south drift, on the 1,500-ft. level, toward the Belcher line, is making fair progress, considering the extreme heat on that level.

BELCHER.—Daily yield, 400 tons of ore, from the 1,200, 1,300 and 1,400-ft. levels. Work has been suspended on the 1 000-ft. level until better ventilation can be secured. Working operations throughout the mine have been somewhat embarrassed during the past week, both by putting in of new machinery and the extreme hot weather, which causes a vast difference in the heat on the lower levels.

OVERMAN.—The main north drift on the 1,200-ft. level is making good progress. The north drift from the 200-ft. station in the winze is still driven northward in quartz and porphyry. This drift is intensely hot, so much so that but slow progress can be made. Sinking the main shaft was resumed on Saturday last.

IMPERIAL-EMPIRE.—Opening the 2,000-ft. station in the main incline is about completed. The only work now being done on the 1,850-ft. level is the driving of the main south drift to connect with the south winze from the 1,700-ft. level.

JULIA.—The enlargement of the main shaft for a third compartment is progressing at the rapid rate of 10 ft. per day. Cutting out for a new pump station at the 1,000-ft. level is also making good progress.

CHOLLAR-POTOSI.—Daily yield, 90 tons of ore, the assay value of which is $29 per ton. The repairs to the old Belvidere air shaft are completed, and prospecting in that portion of the mine has been resumed.

WOONVILLE.—The mine is looking well throughout; the ore in face of the north drift, on the 400-ft. level, is opening out finely. The south drift on the 300-ft. level has been again started up, and the face continues in fine ore. The mill is kept steadily running on ore from the mine.

SUTRO.—The main west tunnel is steadily advancing the face in rock that is quite hard, but which blasts out finely. The flow of water does not impede work.

DAYTON.—The water from the shaft has been drained from below the second station level. The third compartment of the shaft is finished from the level of the drain tunnel to the surface, and the new pumps will be put in, ready for use in a few days.

UTAH.—The strong flow of water from the bottom of the shaft still continues. Hoisting and pumping the water goes steadily on, day after day, without intermission or cessation, and with but a slight decrease in the head of water in the shaft.

KNICKERBOCKER.—Sinking the new shaft is making good progress and will be down by Saturday next, ready for the commencement of the opening of the 600-ft station.

OCCIDENTAL.—The old pump is being taken out and a new one put in which will afford greater security against a strong flow of water, should such a body be encountered while sinking.

BALTIMORE CONSOLIDATED.—Sinking the shaft is making excellent progress, the rock working somewhat harder than heretofore. The flow of water at the bottom still continues, but does not interfere with sinking.

DANEY.—The main west drift, at the 400-ft. station, yesterday morning encountered a fine streak of quartz and ore 6 to 8 inches in thickness, with a considerable increase in the flow of water from the face, giving strong indications of a near approach to the ledge.

SUCCOR.—The extraction of ore through the little shaft, east of the mill, continues without interruption, the ore vein often varying from one to three feet in thickness.

PHIL. SHERIDAN.—Very good work is being done sinking the shaft, and the new hoisting machinery will soon be in position.

CALEDONIA.—The shaft is 98 feet below the 800-ft. level, in fair sinking ground. Sinking the air winze below the 700-ft. level is making good headway.

CALIFORNIA.—The north drift from the Virginia Consolidated on the 1,400-ft. level is still driven vigorously ahead.

LEO.—The main tunnel is being driven steadily ahead. The ore streak continues from 18 inches to 2 ft. in width, and of excellent quality.

AMERICAN FLAT.—The new drift mentioned in our last report as being started at the 750-ft. station of the Baltimore Consolidated shaft, is being driven ahead with all the vigor possible toward the American Flat ground.

PICTOU.—The main tunnel continues to be driven ahead. Very favorable looking stringers of quartz are occasionally met with.

BEST AND BELCHER.—Surveys are now being made for the more thorough prospecting developments of this valuable little mine, which lies directly between the Gould & Curry and Virginia Consolidated mines.

FLORIDA.—The bottom of the new shaft is in excellent sinking ground at present, with no water to interfere.

LADY BRYAN.—Sinking the new shaft is making excellent headway, with strong indications of soon cutting the main ore vein.

TYLER.—The flow of water from the east drift at the 200-ft. station has been nearly drained again, so as to permit of the resumption of work in the ledge.

BUCKEYE.—The extraction of ore from the south winze has been commenced.

NEW YORK.—Drifting for the ledge at the 600-ft station is making good progress with fine prospects of a good development soon.

KOSSUTH.—The new machinery is about completed, ready to resume sinking the shaft and prospecting the first station level.

Arizona.

BLACK CAÑON DISTRICT.

BLACK CAÑON.—Arizona *Miner*, July 18: Swilling & Co. and another company continue to work ore in their six arrastras, with profitable results. Mr. Pfandler and his partners have constructed and are running arrastras by horse-power. Some Mexicans, while prospecting the bed of a creek for placer gold, found several large pieces and immediately measured off claims, which they are now working. The distance from Prescott to these "diggings" is about 50 miles, by the nearest trail, which is very winding.

HASSAYAMPA DISTRICT.

SOME OF OUR GOLD CROP.—*Miner*, July 23: Mr. Jas. S. Giles showed us, this forenoon, about $350 in native gold, from the mines of Lynx and Hassayampa creeks, near Prescott. Some of this gold was taken out of the beds of the creeks, the remainder out of quartz rock, by arrastra process. Of course, this is but a *taste* of the gold crop of this vicinity, this season, as tens of thousands of dollars have been taken out by a very few miners. What may we not expect when Arizona shall have as many mills and furnaces as Nevada?

British Columbia.

CARIBOO DISTRICT.

MINING NEWS.—Nanaimo *Free Press*, July 15: The mining news is sparse. Next week, however, the claims on Lightning will commence pumping out, and work will be actively resumed in the different claims in this district.

BURNT CREEK.—Homeward Bound Company are in good pay; washed up 48 oz. last week. Old Dominion Company have brought in a ditch which will give them a good supply of water all season. Two Chinese companies hydraulicing and ground sluicing are doing well.

JACK OF CLUBS.—Two Brothers Company's shaft is down 165 feet—the deepest shaft in Cariboo. Everything looks favorable, and they will commence to open out next week. Two Sisters Company are getting along well with their drain.

YAKIMA MINES.—Cor. Dalles *Mountaineer*, July 15: Miners on the Pishastin, and a tributary of it, called Nigger creek, are making fair wages—from $3 to $6 per day. The mines on this side of the range, on the Swock and Yakima are variable. A good deal of mining outside of discovery has ceased, the men have gone prospecting in other quarters, while the discovery boys are sometimes doing remarkably well. Week before last they (six men) took out $500. One piece weighed $184.67, another $34, and from that down to six dollars. It was nearly all coarse gold. Then the week following they did not make to exceed one dollar per day to the hand. Old miners are sorely puzzled as to where that pay streak extends. The pay will be more regular on the Yakima bars, but the water is still too high for successful mining there. Two and a half to three cents to the pan is quite common on many of the river's claims.

Colorado.

CLEAR CREEK DISTRICT.

CLEAR CREEK.—Colorado *Miner*, July 23. The mines in this district, old and new, are generally producing well.

SEVERAL new discoveries have recently been made on the Seaton Hill, near Idaho Springs, which show fair assays.

THE rush for that portion of Clear creek

[Continued on Page 76.]

Mineral Wealth of Colusa County.

Last week we visited a portion of our county, of whose richness we were bnt little awsre. We bave rsad small reports of our minersl wealth. Bnt practical experience in a visit caps all knowledge you can otherwise receive upon tbe snbject. The first mine we visited, accompanied by Messrs. Chapin & Eaton, part owners, waa the

Elgin.

Tbis mine is as yet undeveloped, hnt the richness of the prospect is self-evident. Everywbere seams of the richest ore are revealed to view, and ere long it will tnrn ont to ba one of ths richest mines in that vicinity. The Elgin company opened their mine abont six months ago, and have now s force of ten men, together with a retort, from which they run four flasks per week, and ship to Booth & Co., of Ssramento. They are busily engaged in rnnning tunnels, and ere long we will hesr of a big strike for the Elgin. They are preparing to hnild a furnace which will be complete ahont fall. This mine is nnder the superintendence of J. Melbourne. While present thsy ran off a retort of 34½ per cent. ore. From tbe Elgin we proceeded to

The Abbot,

Whose reputstion is already known. Mr. G. C. Ingram, euperintendent, kindly brought us throngb the tunnels, inclines, and down into the shaft of this mine. Its richness is nndoubted. Ten experienced miners are continnally employed in extracting furnace ore, and the work goes on nigbt and day. Tbey are now busily preparing to build a furnace at a cost of $10,000. No qnicksilver has been as yet manufactured from tbe Abbot, but they have now furnace ore sufficient to last a montb, when started. The Abbot is an old developed mine, but has been under tbe auspices of the present company but three months. From the Abbot we proceeded to the

Buckeye,

The best developed mine in this region. Ssama of the richeat cinnabar are plainly visible wherever the eye glancea, and from this mine very little waste rock is extracted. The Buckeye runs a force of twenty-eigbt men, steady, and retorts weekly fifteen flasks of quicksilver. A flask is considered worth $100. The Elgin and Buckeye are the only two mines reducing ore, and paying for working as they proceed. Grading has already commenced for the building of a furnace for tbe Buckeye, wbich will be an extensive arrangement. Tbe contract haa been let for the hurning of the brick, and in two months it will be erected. Mr. Caswell is the general snperintendent, and Mr. D. Smith, who kindly volunteered to show us around, is nnderground auperintendent. We paid a visit to the

Empire,

A new and rich prospect, struck but a monthago. The value of this mine is in the small amount of labor necessary to work it, it being all clay soil, composed of mngnesia, lime and cinnabar. The superintendent, Mr. H. B. McNemer, is buay pushing the mine through, and this at slight expense, it having cost but $125 in one month. Tbey have struck the ledge of the Mansinette already, and ere many days Empire stock will he high up, as the showing is now the very best.

The mines in this section of our connty excel all we have seen in richness. The very best ore, which will average 30 per cent., is found on the snrface of the hills.

We cannot forget to make mention of the

Gas Fire,

Which issues from the mountain in close proximity to tbe Elgin mine. The side of the bill is all ahlaze, and has been so for eigbt years, when fire was communicated to the gas which emitted, by M. G. L. Eaton, and has been burning steadily ever since. This accrues enormously to the richness of the Elgin, as they can run tbeir furnace with little or no expense. An escape is now taking place of 125 oubic feet, sufficient to run a dozen furnaces.

Our time was so limited we could not visit the other prospects, but will return ere long again.

This portion of our county abounds in quicksilver wealth, and those owning mines will at first have to enoounter difficulties, but ere long tbey will overcome tbe hardships of developing their mines, and in all experience with regard to mineral wealth, Colnsa has the richest.—*Independent.*

White & Shiloh.—The Unionville *Silver State* says of the Wbite & Shiloh, the principal mine in Galena district: "Since work was commenced on thia claim, about four years since, 13,000 tons of paying ore bave been taken from it, between 7,000 or 8,000 tons of which yet remain on the dump. The mine is well opened, and from a thorough examination of the numerous drifts and stopes it is estimated that there are at least 32,000 tons of paying ore now in sight in tbe mine."

The following is given by a Los Angeles paper as a fair average of wages paid in Los Angeles: Farming hands, $30 per month; laborers per day, $2.50; sboemakers, $4; carpenters, $4; masons, $5; plasterers, $5; gas-fitters, $5; blacksmiths, $4; wagon makers, $4; carriage painters, $5; harness makers, $3; tinsmiths, $3.50; oahinet makers. $3.50; stair builders, $4.50; bouse servants, $30 per month (very scarce).

The Silver Cord Mine.

The Owyhee *Avalanche* gives the following about the Silver Cord mine:

Day before yesterday, hy invitation of, and in compsny with J. O. Lennon, the efficient and gentlemsnly superintendent, we went through the Silver Cord mine. Work was qnietly inaugurated upon it last winter, and hnt little bss hitherto heen known or said about it on the outside. We knew thst Mr. Lennon wss taking ont some rich ore, hnt we did not expect to see such a large and rich ledge as met our gaze in the various drifts and levels. It has a substantisl shafthouse and very good steam hoisting works. The vein dips to the eastward at the rate of ahont 33½ feet in 100. The adit, or drain tnnnel, is 40 feet below the surface. The first level is 80 feet deeper, in which a drift has heen run 100 feet north and 15 feet south of the shaft. At a depth of 100 feet helow tbe first level we find the second level drift extending 140 feet north of the shaft and 85 feet sonth. The third is also a 100-foot level, and already hss a drift in 70 feet north and 120 feet sonth of the shaft. A winze connects the second and third levels 30 feet south of the shaft. The shaft is down 40 feet for the fourth level and a winze will also he snnk 90 feet south for the purpose of connecting the third and fourth level drifts. As soon ss the fourth level is opened the mine will he in splendid shape for tsking out ore. The vein is well defined, with smooth, solid casings. Its average width in the second and third levels is from 18 inches to two feet, sbowing free gold and silver in abundance, and assaying from $60 to away np in the thousands per ton. But little blasting is required to take down the ledge, mnch of which is decomposed and similar in character to the rich vein matter formerly found in the Poorman. The Silver Cord is situated south of the latter named mine, and many are of the opinion tbat they are one and the same ledge. A tank 16 feet long, six feet wide and seven feet deep, has heen put in the bottom of the second level, which collects all the water and renders the sinking of the shaft oomparatively an easy task. Mr. Lennon is doing all his work by contract, which be finds to he nearly 50 per cent. cbeaper tban hy having it done hy the day. On the dump there is qnite a large pile of as rich ore as can he found in camp, and plenty more will soon be takeu out. As soon as the road leading to the mine can he repaired they will commence hauling the qnartz to the Ellmore mill. We have ventured the assertion, and will hack it up! with a reasonable wager, that tbe Silver Cord will be on the list of dividend paying mines before the snow falls.

The Great Air Shaft.—The Belcher Co. lsat Saturday hegan work on their new air shaft at the 850-foot level, atarting at that point to raise up and connect with that portion of the ahaft now coming down from the aurface. The first set of timhera was put in on the 850-foot level last Saturday. Tbe ahaft is now down 300 feet helow the surface. Work will shortly he commenced at the 900-foot level; indeed, tho shaft will be completed to the lowest level in tbe mine as soon as possihle. Tbis will he strictly an air shaft, and the only one worthy of the name on the lead. It consists of two unusually large compartments, each being six feet square in the clear. These bnge, unobstructed openings will admit of the upward rush of immense volumes of air. The shaft will he of almost incalculable value in the ventilation of the mine, and also of the Crown Point. The great column of heated air aseending throngb it will cause a strong downward draught of pure surface air into all the lower shafts. No cages will he placed in this new ahaft to obstruct the ascension of the air ruahing up from the aweltering regions below. In one of its compartments there may be placed a cage for lowering large timhera and for use in hoisting out men in case of a fire in the mines. Hereafter this large sbaft will be pushed down as fast as new levels are opened, and will alwaya ha kept at the bottom of the mine, with connections on all the levels.—*Enterprise.*

South Chariot.—This mine made ita first shipment of bullion last Wednesday—five hars, valued at $11,000—and will follow it with othera every few days. The mine continuea looking splendid in the lower levels, and additional miners are heing put to work as fast as the stopes can be opened. Most of the ore has hitherto come from the 6th level, but they have commenced in the 7th, and will he stoping in the 8th next week. The new hoisting works are everything tbat conld be desired, and are sufficient to work the mine to a depth of 2,500 feet. The main building enclosing them is 75x32 feet, to whioh a large addition is being built for sorting room, ore house, blacksmith shop, carpenter shop, etc. South Chariot ia all right from this time henceforth, and will make plethoric the pockets of lucky shareholders.—*Owyhee Avalanche.*

Alaska Mine.—This ia somewhat of a new ventnre and is located in the neighborhood of the once much talked of Ione mine. It is in the course of a prospecting working at the present time. Den. Meagher, who seems to he posted on the Alaska, although be holds no interest in it, says that the rock from the ledge "is staving good rock." We know that there are hundreds of staving good ledges all around here, beside the Alaska, and all they want in the way of making the "staving" manifest is some picking, blasting and other work. Keep on proapecting, for there is pay in it.—*Grass Valley Union.*

Pioche Mines.

The Pioche *Record* of the 19th ssys: The condition of the two principal mines of this district, the Raymond & Ely and the Meadow Valley, has changed so little since onr report of last week, save in mere length of openings made, as to call for little or no comment. At the Raymond & Ely the shaft is being enlarged on its western end and on one side. Men are engsged at this work at two points in the shaft, and in a few dsys others will be added. The other work going on in the mine is in the eastern sud western drifts on the 1,200-foot level and the western drift of the 1,000-foot level. The faces of these drifts look ahout the same. The western drift of the 1,200-foot level is still in country rock, and will probahly not resch the ledge nntil it is advsnced some 60 or 70 feet further.

In the old Creole works preparations are heing made to extract some ore, whicb will he raised to and passed through the old Burke tunnel.

The Magnet company during the past week has not raised as much ore as nsual. The grade of that which has been extracted is ahout the same as heretofore.

Operations at the Meadow Valley are going on as ususl—the appearance of the mine not varying in any essentisl particnlar from thst noted last week.

At the Pioche the work of exploring the new gronnd is proceeding as rapidly ss circumstances permit, and continues to offer a very encouraging appearance.

The Newark is yielding a considerable amount of ore of a very fair grade, and is shipping it so rapidly to the mill that it is accnmulating. The latter is kept constantly at work either on cnstom rock or the company's ore, and is giving good results, shipping something over $12,000 during the week.

From the American Flag some considerable ore is heing taken from the upper levels. The station has been opened on the 1,000-foot level, and the cross-cnt is being opened towards the ledge.

The Mazeppa shaft of tbe Washington & Creole is now within a few feet of the main level of the mine, and will reacb it in the course of a few days. The easterly level lacks ahout 75 feet of making the connection, but is being pushed as rapidly as possible. Work is going on in the west winze, which is still in ore.

The Portland, Bowery and Chief of the Hill are in about the same condition as when lsst reported on. From the latter a ahipment of ore has been made, which was taken ont by men working on shares.

Seven-thirty.—What pickings and shovelings are in progress around Grass Valley mining district are paying very well. The Seven-thirty mine haa been pecked at for a number of years, and whenever it haa been hit a few blows, it has turned out the gold. Yet the ownera were afraid of it and at a critical time refused to pay taxes on the property. They seemed to think that as they conld not see gold down in the ledge a thousand feet or so helow any workings, that there could not he much gold in that concern. And so the Seven-tbirty claim and all ita appurtenances were allowed to he sold for taxes, and the amonnt of the taxes was only $60 or $70. In the last week something like $5,000 or $6,000 bave beeu taken from this mine, and that too without any great tronble and at a very trifling expense. The mine has shown that it was good for its taxes, at least. The history of the Seven-thirty has in it much that is significant. It teacbes that very frequently a little work will dig out a great deal of gold in this district. The lesson ought to he learned, and picka and sbovels and drills and blasting powder come into more general use in Grasa Valley. There are plenty of ledgea here which await work in order to make them pay. The home prospector, when he sticks to his huainess and puraues it with energy, is sure to make a good strike. Think of the Seven-thirty and go to work.—*Grass Valley Union.*

Omaha Mine.—The Grass Valley *Union* says: This mine is looking well. A few months ago aome folka thonght it was a failure and that it would shut down. But the owners, mostly Sacramentans, did not see any sense in stopping work when only a little scratching bad been done. So M. Dodsworth, sometimes called "Nick," came up and took charge of the works. He has made a good showing. The ledge ia nearly two feet thick and carriea mineral in quantities. A crushing of rock taken from the drift is about ready to be cleaned up, at Larimer's mill, and it is safe to say tbat the crushing will give $25 to the ton. Some of the ore on the old dump, which was left over from a former crushing as being of no account, has yielded well by mill process.

Newark District.—We paid a short visit to this locality and obtained the following as the result of our observation: Mr. Stratton, an owner in the company, who haa been appointed general agent and auperintendent of the mines and mill, informed us he would first settle up the old hnsiuess before making any new move. Tbere were quite a number of men at camp, mostly idle at present, some few being still at work in the mines. The mill ia shut down, and nothing definite is known as to the time of its being again started up. Mr. Stratton seems a gentleman fully alive to the situation, and will exert his energies in bringing order out of the chaos into which the company has been placed hy former mismanagement.—*White Pine News.*

Eberhardt & Aurora.

On account of a press of other matter, we find it impossihle to give an extended acoount of the appearance of the mines now being worked hy this company, hut will endeavor to do so in our next issue. Howevsr, we are enahled to give the following as the resnlt of a conversation with William Maxwell, foreman, regarding the present outlook: A drift run north from the Peerless chamher a distance of 50 feet resulted in tho opening up a large hody of high grade ore, and the discovery has heen named the Wyon chamher. The work prosecuted shows at this writing a width of 40 feet, and depth 60 feet, with ore on sides, top and hottom. Twenty-eight feet more of tunnel will connect the opening with the centrsl shaft, whence all ores hereafter extracted will he raised hy means of the steam hoisting works now being placed in positiun. When this connection is made, the Peerless, Beecher, Ladies' and Wyon chambers will he united, and uninterrnpted communication seonred. In this hrief item it will he impossihle to give more tban a summsry of the whole workings, which sre simply that from the Ward Beecher Consolidated on the north, to tbe South Anrora on the south, indications point to one of the finest properties on the Pacifio coast. Many thousand tons of high grade rock are now in sight, and the work being done is daily exposing other and larger hodies. Manager Frank Drake has concluded to ahandon the South Aurora tnnnel, which for a long time has heen the way used for the transportation of ores, etc., and for which a royalty has been paid to the South Aurora company, hereafter conveying all oros through the central shaft. Oft repeated predictions seem certainly to he approaching nesrer, a snrer confirmation than ever hefore imagined, and we have now no hesitancy in ssying thst much-ahused Treasure Hill will will soou he the great attraction of Nevada in a mineral sense. At least, we are prepared to await the course of events, as are many others now deeply interested in the future of the district.—*White Pine News.*

Lida District.

A oorrespondeut of the Inyo *Independent* says: I will give yon an account of the result of the experimental furnaces built hy the Marrotte Bros. at Sylvania. The furnace is huilt on the principal of a Mexican "basso," and is so constructed as to receive the lead when melted in a hasin, the alsg floating on top, and is removed through a aide tap; the lead is alao drawn from a tap-bole in the side; the ore is laid on a sole or hearth, and is reduced by the heat from a wood fire (no coal heing used); the slag is perfectly olear of any globulea of lead; the ore smelted was of second-class lead ore, being only an experiment; the result waa that from five tona of this ore one ton of ailver lead waa produced; the bullion was 12 fine, value per ounce $.0155; value per ton of 2,000 pounds, $457.98. This provea beyond a douht that the orea of thia district are good, this heing aecond-class ore. You may expeot astonishing figures when they make a run on firat-olass ore, which will be soon.

In Lida district all the mines that are being worked look exceedingly well. There are 11 men at work on the Death Valley mine, commonly known as the "Frenchman's mine." Tbey have a four-foot vein of good ore; they have out on the dump about 200 tona of ore that will mill over $200 per ton. Thia bids fair to he the finest mine in this country. Three men are at work on the Sewando, taking out snlphuret ore (the only mine in thia camp in which sulphuret ore has heen found) of very higb grade, assaying $1,000 and upwards. Active operations have heen commenced on the Benet mine, and also on the Simon Pure. The three latter have been leased to different parties.

A Patient Worker.—A correspondent of the Salt Lake *Tribune*, writing from Star district, says: Ahout three years ago a man hy the name of Omar came to Star and hegan prospecting in the foothills, and at laat he struck a good proapect, and went to work on it, a party in Pioche assiating him. Qnietly and steadily he kept to work until he had run a tnnnel several hundred feet into the hill, doing nearly all the work himself. He now haa strack it, and those who have seen the mine say the gold quartz in sight is truly wonderful. He has also huilt a small furnace on the draft principle, to test other ore in the mine. Reliahle miners say that thia ia a rich and wonderful mine, having hoth smelting and milling ore. This mine, I helieve, has only three ownera; aud will, no douht, before long, cause considerahle excitement.

Pancake Fire Rock.—In the early days of amelting iu Eastern Nevada, it waa found necessary to find a substance for lining purposea which would resist the intense heat required in smelting, and the Pancake sandstone was the result of explorations to discover the same. Since that time fire hrick has heen imported from St. Louia, Philadelphia and other points with which to line np furnaces, bnt, after a ahort trial, it was found that nothing would so well fill the hill aa did the "Pancake." To-day, quite a large traffic baa sprung up in this line of husiness, and ordera are received from all neighboring districts, as well as from Omaha and San Francisco. All furnace men agree that no other stone has ever yet been found the equal of that now in nse.—*White Pine News.*

Good Health.

The Human Frame.

No. 8—The Muscles.

A man with the skin removed is a curious-looking object. He is thon literally envelnped in a blanket of fat, of greater or less thickness according to his inclination towards corpn-lency, or otherwise. Remove this adipose tissne—which is deposited beoeath and in the meshes nf a delicate membrane, or fascia—and ynn thsn perceive a still moro ourious object; not a man now, but a machine. He is nnw a mass of ropes, so to speak, of all lengths, sizes and shapes, nnd attached in a bewildering manner to his bony framewnrk. The labor of maatering the technical details of a man-of-war's rigging is nothing to that required to unravel this labyrinth nf stays, halliards and olswlines, which have the wonderful power of shortening or lengthening themselves at the option of their possessors.

Anatomists compute about six hundred pairs of these muscles; some like ribbons, others like cords and still nthers like fans, feathers, etc. Ths largest are very coarse and strong, as, for instance, the glutei mnscles which help to soppnrt the body on the lnwer extremities. From this size they gradoally pass to microscopical minuteness.

Muscle itself is what is called "flesh;" is of a deep-red color, and is composed of fibrin. It is disposed in little bundles of parallel fibers, which aro bound together with a delicate arenlar tissue. It is very contractile, and to this property we owe our nlmost unlimited power of movement. Like all other organized substances it is formed of cells so arranged end to end as to form the "ultimate fibers" which make up ths larger bundles of which we have spoken. Its contraction is supposed to be owing to a change in the long axes of these almost infinitesimal cells; just as a hollow rubber ball can be flattened or elongated between the hands. Some theorists have supposed the life of these cells to last only during a few contractions of the muscnlar substance, and hence ont every movement to involve the death of myriads of these minnte prntotypes of our lives. However this may be, it is certain that their existence is oomparatively very short, and that the old worn-out cells are continunlly giving place to new and vigorous ones; so much so that we are supposed to have an entirely new body each seven years of our existence. Yet the transition is so gradual, and the new cells snch faithful representatives of the old that but little hope is held out by the above fact of any great change in onr personal appearance however much some of us might desire to change the old for a handsomer shell. The only positive change consists in the number of these ultimate cells, muscular and others, which prodnce differences in our weight and figure, according ns the cell supply exceeds the demand for new material, or otherwise.

It is curious to reflect that death is thus ever present with us; that withiu ourselves a fierce battle is ever raging between life and death, and that our thriving or wasting bodies tell of temporary success to one or the other of these implacable foes. By-and-by the powers of life begin to grow weary of the unceasing attacks of their relentless enemy, and the wrinkled, wnsted body tells na that denth is slowly but surely gaining another of his inevitable victories. If the laws of nature have not been violated, and no accident hastened the fatal issue, this contest lies simply between the nltimate cells of our bodies—a warfare waged by the tiniest of combatants—nntil the deaths so far exceed the births that the human mechanicism runs slower—slower—stops!

A few words as to the attachment of muscles to the bnny frame-work. Each muscle as it approaches its termination loses its fibers, while the fibro-areolar tissue, whioh bind the bundles together, becomes denser and thicker, and finally merges into a round or flat tendon, snoh as every nne is familiar with, which then passes to the bone, and is glned, as it were, so firmly to its surface that the muscle will tear in two before this tendon will break. Usually there is a roughened spot on the bone in order to afford firmer attachment, and often prominences or "processes" by which to afford leverage; but this will be more fully spoken of when the bones are under consideration.

Phosphorus as a Cure for Oataract.—Dr. Combas gives a oase of a girl, aged 24, of nervous, lymphatio tempernment, suffering from capsnlo-lenticular cataract, hardly able to discern light from darkness; suffered frequent headaches. Two or three drops of phosphorized oil were dropped into the eye daily, and frictions of the same used over the forehead. After four months of this treatment was used persevoringly, the eye improved, colors could be distinguished, and the opacity of the lens so far diminished that it could not be discerned at a distance of two or three paces.

An army hisouit, oomposed of one-third rye-flour, one-third beef dried and powdered and one-third sourkrout ground to powder, was used by the Russiau army in the Khiva expedition with great benefit. It was eaten with great relish, and proved highly preservative of health.

Among the strange presoriptions for dyspepsia, black currant leaf tea is recommended.

Physical Life.

It is popularly snpposed that we change our cnnstitntions once in seven years; hut practically svery decade makes n turning point in life. It is not too much to say that, barring accidents, a man can at certain dates docide what manner of death nnd from what class of disease he shall die. The formation of the constitution in early life—say from the age of five to fiftesn—devolves on the nnrse, the mother, and the training in the nursery aud school-room. In the nursery, at any rate, over-feeding is a cardinal vice; but the over-fed children whn eat flesh meat three times a day become so gross and unwieldly as to be a burden to all concerned; while tight stays, tight boots and high hoels develop every evil under the sun, from bunions downward. At this point two years of gymnastics, or a couple of years spent oo board of one our training ships, does wonders for our boys, who get tho use of their arms nud legs to an amazing degree. The athletio work performed by schoolboys nnd university men is perhaps at its best in these days, though most happy is the man who is never overtrained, because he is perpetually in oondiiion. From fifteen to twenty-five n man has to prepare for that legitimate enjoyment of life which should by rights be his. He has in all probability ohosen his profession, memory is at its best, ambition at its highest, and his temptation to burn the candle at both ends—to be n brilliant boon companion, a man whose good tales are remembered, and whose witty sayings are everywhere quoted—is almost irresistible; facility does not come with age, and the best stories grow stale. Of the nnmber of prematurely exhausted intelleots and shortened lives broken down in this way there is no need to tell. Every man's memory will furnish him with a list of names more or less well known.

From 25 to 35 is the true time for all the enjoyment of a man's best powers, when physical vigor is at its highest, and human passion is at its full strength. During the last half of this decade n man should bo assiduous to construct a system of philosophy by which to rule his life, and to contract a chain of habits intelligently, so that they should not sit too tightly upon him, and yet cautiously, so that he should neither be their slave nor too easily cast them aside. The exact proportion of physical and intellectual strength should be gauged, and the constitutional weakness, or, in other words, the disease toward which a tendency exists, should be ascertained. Preserve, if possible, the absolute neoessity for exercise, and have your place of business two or three miles away, over whioh let nothing tempt you to an omnibus or carriage save rain. The day on which a medical man gives up riding to see his conntry patients, or the use of his own legs to see his patients in town, and takes to a close brougham, fixes the date when sedentary diseases are set up—indigestion, liver, kiduey disease, and so on; while if, to utilize his leisure, he reads as he drives, his eyesight becomes seriously affected. From 35 to 45 a man should arrange with his food and square hypochondria. He cannot, it is true, change his diathesis, but he can manage it. The habitual character of food, no less than its qnantity and quality, begins to tell whether it charges the system with fat, muscle, sinew, fiber or watery particles.—*Pall Mall Gazette.*

In regard to the hight which travelers are able to attain, we may state that Alexander von Humboldt, in his ascent of Chimborazo, was compelled to stop at a hight of 16,000 feet, at which point he had to give up from suffocation; but in late years the brothers Schlagintweit ascended the Himalayas, and slept all night in bivouac at a hight of 19,200 feet, and later ascended the peak Ibi Gamin, 22,200 feet high. The English astronomer, Mr. Glaisher, claims that he has ascended to a hight of 26,000 feet without feeling any discomfort, and that only when reaching 32,000 feet he experienced auy very serious feeling of snffocation. No doubt, different constitutions are differently affected; some are unable to resist diminished atmospheric pressure; others, increased pressure. —*Scientific American.*

Cure for Hydrophoria.—A German forest-keoper, 82 years of age, not wishing to carry to the grave with him an important secret, has published in the *Leipsig Journal* a recipe he has used for 50 years, and which he says has saved several men aud a great number of nnimals from n horrible death by hydrophobia. The bite must be bathed as soon as possible with warm viuegar and water, and, when this has drled, a few drops of muriatio acid poured upon the wouud will destroy the poison of the saliva, and relieve the patient from all present or future danger.

Breathing in Rarefied Air.—M. Paul Bort describes in *L'Institut*, a series of experiments made on himself in a receptacle in which the diminution of pressure of air was carried to 25 centimetres—equivalent to an altitude of nearly a mile and three quarters. He found he could avoid all the ill effects of this diminished pressure by breathing a mixture of 60 per cent. oxygen with atmospheric air. This discovery has already been made trial of by aëronauts, who will, by its means, be able to attain hights hitherto impossible.

Chilblains are successfully treated by applications of sulphurous acid solution, by means of a camel's hair brush or by a spray-producer.

Useful Information.

Cotton-Gunpowder Blasting.—Trials nf the cotton-gunpowder manufactured at the works of Oare, near Faversham, of considerable importance, were made last week with great snccess in the fine Kentish ragstone quarries at Preston Hall, nesr Maidstone, from which the proprietor, Mr. Bensted, is now gettiog ont stone for the new snmmer palace of the King of the Belgians. Two ohnrges of 25 pounds of nncompressed powder wore fired hy electricity in holes grubbed in from the vertical face of a cliff at least 50 feet high, along a thick band nf sand parting, soms thonsands of tons of rock heing thereby fissured in all directions, in n way to make easy the fnture operations of weighing or lifting out of the stone for building and other practical purposes. Charges of 100 pounds of ordioary black gunpowder would probably have failed to have given anything like corresponding results, if indeed they would have accomplished any worthy effect at all, nnder the like circumstance of a perfectly horizontal borehole. The interest which attaches to the experiments is thnt this brand of powder oan be manufaotured from beginning to end without any risk whatever of explosions. Some ten-pound charges of the same material were afterwards fired, demonstrating the power of the powder to be more than equal to that of the best gun-cotton; whilst a like oharge of the oompany's strongest blasting powder, manufactured nnder very high pressnre, gave very startling results, rivaling those of the nitro-glycerine oompounds of the first order.—*Colliery Guardian.*

Skimming the Seine.—Of all the things in the world whioh appear utterly worthless, are soap-suds. Mr. Simmonds takes a different view. He tells us that "soap-suds, as n stimulant of vegetable life, can not be too highly appreciated." We oan not go into his arguments on the great value of soap-suds, and it is sufficient to say that, when poured out as n mannre, they are of prodigious efficacy. The French, who are up to everything in the chemical line, have taken a proper view of the value of soap-suds. Whether from private dwellings in Paris, or from the barges of the *blanchisseuses*, the Seine must have a good deal of soap floating about it in a wasteful kind of wny, to say nothing of the greasy pollntion from dead dogs and cats. There was a fortune, if properly looked after. An enterprising firm, tortified by the authority of the Prefect, determined to begin a system of skimming the Seine. Yon would imagine it was a nonsensical idea. Quite a mistake. By uniting the skimmings of the river with the offal from hospitals, the firm is able, hy the aid of chemistry, ateam and cookery, to fatten 8,000 pigs, and to produce annnally 500,000 pounds of soap. Let England touch that if it can! Oan any one mention a town in Great Britain where the most valuable productions are not senselessly floating off down the gutters and sewers, never more to bs of use to human beings?—*Chambers' Journal.*

Moving in a Circle.—In a recent nnmbor of *Nature*, a letter appeared in which it is stated that it is believed in North America that a lost man always strays in a circle toward the left. I may mention that whilst walking in a woody and hilly part of the New Forest I found to my great astonishment that I had described a complete circle, and it was toward the left. My father also tella me that he has been informed, although under what circumstances he does not recollect, that the same idea obtains in Australia. It has been suggested that the reason of this fact (if fact it is) is, that the right side of the body is stronger than the left. In confirmation of the truth of this explanation, it is worthy of notice that Dr. Wm. Ogle finds that men are right-legged as well as right-handed, although the rule has not so nuiversal an application. One of the points adduced by him in evidence is, that bootmakers generally find the right foot larger than the left.—*Cor. Herald of Health.*

Butter and Fats.—Dr. J. Campbell Browu says that the proportions of the chemical constituents vary so greatly (from zero upwards) that no reliable evidence of purity or impurity can be obtained by estimating the different fats obtainable by decomposing butter. In fact, the distinction between pure butter and butter mixed with flesh fats is no more a chemical one than the distinction between different animals or different plants. The physiologist distinguishes one kind of tissue from another more readily by their microscopic characters than by their chemical composition; and microscopical examination with polarised light is the most reliable means of distinguishing pnre butter from that which contains an admixture of less easily digestible and less palatable fats.

Use of Paraffine in Pharmacy.—To keep metallic surfaces from oxidizing, it is only necessary to immerse them in melted paraffine, or paint them over with it. Strips of paper, say Manilla paper, drawn through melted paraffine, will make a very useful covering for bottles, boxes, pots, etc. Carbonate of ammonia can be kept in an original pound bottle perfectly pure and free from contact with the air, by sealing it with paraffine. Prepared paraffine paper is first laid over the mouth of the hottle, the cork is then inserted, and dipped iuto melted paraffine. The cork is in a great measure protected from the ammonia, and will last a long time.—*Druggists' Circular.*

Curious Origin of Fires.

Alfred Tozer, of the Chief Fire Station, Manchester, England, commnnicates ths following paper on the origin of great fires, from a natural history point, to the *Science Gossip:* In one warehouse two instances occurred in which rats gnawed through a lesden gas mniu pipe a few inches above the floor. Other similar instances have occorred of rats gnawing a gas in mistake for a water pipe. It has been thought they heard the water bubbling in the gas pipe, and have not found their mistake until they have penetrated the pipe. The warehouse was on both occasions damaged by fire through some of the employés seeking for the escaping gas with a light.

I have attended and traced several instanoes of fires occurring through rats and mice gnawing lucifer matches. Matches are now dipped in paraffine wax instead of sulphur, as before; the rats or mice have carried them nnder the floor for the purpose of gnawing off the wax; in doing so, their teeth have come in contact with the phosphorus at the ends, and so fired them. In 1856 I attended a fire at the Snltan's Palace, at Scutari, Asia Minor. After the fire I gathered from under the flooring a quantity they had been gnawing. Some years ago a fire occurred in London, oaused through a jackdaw getting at n box of lucifers, and pecking them nntil it set them on fire.

Fires have occurred through rats and mice conveying, nnder the flooring boards, oily and fatty rags, which have afterward spontaneonsly ignited. This is rnther a oommon cause of fires in cotton mills.

The following is an extraot from the Journal of the United Service Institntion for 1868: One of the presents sent to the mnseum for this institution is a rat's nest and young. The nest was set on fire by a lucifer match, ignited by the old rat as she worked it into her nest. Lieutenant Gilmore states that a fire occurred on board H. M. S. *Revenge* from a similar cause.

Cats and dogs have caused fires in various ways, such as upsetting explosive and inflammable things into fires and lights; also through lying inside fenders and under fire places. Hot coals have fallen and adhered to their backs, which caused them to bsat a hasty retreat, no doubt being anxious to get rid of the annoyance as soon as possible. They have sometimes snoceeded by rolling or rnbbing on oarpets, curtains, heds, straw, shavings, and other inflammable things. The last instance I recolleot occurred at a baker's shop. A dog was lying under an oven fire, and a piece of ohip fell from the fire on to his back. He immsdiately ran to some shavings and rolled upon them, at the same time setting them on fire before the eyes of his mastsr. In 1863, three distinot fires were caused in one room of a gentleman's house, through a cat lying inside the fender, when some hot ashes fell out of the fire on to its hack, which oaused it to rush abont the room, when the cinders were deposited in different places, which set fire to the oarpet.

That mischievous animal, the monkey, has lent its aid to the devouring elsment. Fires have occurred through its agenoy in a similar manner to cats and dogs—also through its playing with fire in various ways. In one instance a monkey npset a charooal brazier, and set a room on fire. Many fires have occurred through our domestics hunting bugs and other small fry by the light of a candle or lamp. In their anxiety, especially, to hunt fleas, they forget they may produce an enemy much more to be dreaded. Many fires also occur through persons fumigating apartments to get rid of bugs and various kinds of vermin.

A few instances have occurred through the concentration of the sun's rays upon glass fish globés. A residence was set on firs through the concentration of the snn's rays upon a water oroft standing upon a table. Colored bottles in chemists' shops, cracks, and bull's eyes in glass have been known to focus sufficient heat from the sun to set buildinga on fire.

Birds' nests nnder the eaves and wooden crevices of houses have been frequently set on fire throngh sparks from a neighboring chimney, and have contained sufficient inflammable matter to set fire to the buildings.

Although I have given the dogs the credit of producing work for the firemen, still it would not be fair if I were to omit to mention that they have frequently discovered and given timely notice of fires; and many an aneodnte can be told of the very great interest dogs take in and at fires.

Kalsominino Fluid.—The following is commended as a good kalsomining fluid for walls: White glue, 1 lb.; white zinc, 10 lbs.; Paris white, 5 lbs.; water, suffioient. Soak the glue over night in three quarts of water, then add as much water again, and heat on a water bath till the glue is dissolved. In another pail put the two powders and pour on hot water, stirring all the time, until the liquid appears like thick milk. Mingle the two liquids together, stir thoroughly, and apply to the wall with a white-wash brush.—*Jour. of Chem.*

Exhibiting Photographs. — The effect of photographic transparencies in the microscope, as well as on the screen, is greatly improved by placing a pale blue glass in the path of the illuminating beam. This correots the brown or "foxy" tone which they too often present, and gives depth and richness to the shadows.—*Scientific American.*

Whether carbon exists at all as an impurity in zinc is donbtful, if we consider the mode of its extraction.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Our Gravel Mines; Our New Folding Machine; Unpatented Inventions, 65. The Caracoles Mines; Under the Willows; The Foot-prints of Pomona in San Francisco, 72. The Comet and the Weather; Ground Sluicing; General News Items; Lynch's Patent Illuminating Tile, 73. Patents and Inventions; General News Items, 76.

ILLUSTRATIONS.—Patent Newspaper Folding Machine, 66. Miners "Ground Sluicing;" Lynch's Patent Illuminating Tile; 73.

MECHANICAL PROGRESS.—Tin Plates; New British Steel Guns; Transmission of Power by Wire Ropes; Casting Iron in Sand Molds; Coal-cutting Machines; Stopping Bottles, 67.

SCIENTIFIC PROGRESS.—Remarkable Motive Power, Clay Glaciers; Nature of Electricity; Sugar Contained in Vine Leaves; Atmospheric Dust; New Explosive; Gas Pressure Alarm; Chinese Mirrors; Vaseline, 67.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 68.

MINING SUMMARY from various counties in California, Nevada, Arizona, British Columbia, Colorado, Oregon and Utah, 68-69-76.

GOOD HEALTH.—The Human Frame—No. 8; Phosphorus as a Cure for Cataract; Physical Life; Cure for Hydrophobia; Breathing in Rarefied Air, 71.

USEFUL INFORMATION.—Cotton-Gunpowder Blasting; Skimming the Seine; Moving in a Circle; Butter and Fats; Use of Paraffine in Pharmacy; Curious Origin of Fires; Kalsomining Fluid; Exhibiting Photographs, 71.

MISCELLANEOUS.—California Wheat Exhibit for 1874; Coal at Eureka; The Dunderberg; Useful Information about the Pre-emption and Homestead Laws; Co-operative Mining; Consolidated Virginia Improvements; Idaho Mines, 66. Mineral Wealth of Colusa County; White & Shiloh; The Silver Cord Mine; The Great Air Shaft; South Chariot; Alaska Mine; Picche Mines; Seven-thirty; Omaha Mine; Newark District; Eberhardt & Aurora; Lida District; A Patient Worker; Pancake Fire Rock, 70. The Panamint Mines; Varnish for White Woods; Prospects of our Mining Counties; The Diamond Fizzle; Mica; Bullion from Eureka; Belmont Mining Items; Heat on the Comstock; Collapse of a Miner's Bank, 74.

H. B. PLATT, contractor of the Stockton and Ione Narrow Gauge Railroad, has entered into a contract with the owners of the Ione or Arroyo Seco grant, whereby he obtains control of the coal bede on the grant. Platt agrees to pay fifty cents per ton for the coal, and take it from the mines himself. The beds are supposed to be extensive and the quality of the fuel is good. He further agrees to remove 1,000 ons per month.

THE Spring Valley Canal and Mining Co., of Cherokee, have contracted with Samuel McCarffer to construct a ditch commencing at the high lands of Day creek and reaching a point on the road known as McCargar ranch. The contemplated ditch will open up a large tract of valuable mining land in the part of Butte county.

AN important case of Shaffer against the Milton Mining Co. is occupying the attention of the courts in Nevada county. The suit is brought to recover damages for injuries received by plaintiff while working in defendants' mine, from neglect on their part to provide for the safety of men working in the mine.

LUMBER MILLS.—All the owners of lumber mills on Truckee river and branches, with one exception, have formed a combination, and incorporated under the name of Sierra Nevada Lumber Association. The object is to fix a uniform price at which to sell their products.

THERE are three surveying parties in the field, on San Juan island, looking up sites for fortifications, and examining into their probable cost. They are pushing the work, and expect to have it finished by the 15th of September.

THE HOLLY SYSTEM.—The Sacramento *Union* is disgusted with the Holly system of water works in use in that city, and says "if a vote was to be taken on the subject, it would be spurned with contempt."—[The vote?]

IT is stated that the Pittsburg mine, in Nevada county, was owned by Dr. Merritt and the late W. B. Bourn. At one time it made $20,000 and $30,000 per month.

A NEW town is being laid out about two miles southeast of Middletown, Lake county, and near the Great Western quicksilver mine.

The Caracoles Mines.

Our readers frequently hear mention made of the Caracoles mines, but perhaps few know anything about them. In conversation with a gentleman recently from there, we gleaned some facts which may be of interest. The mines are situated about 110 miles from the port of Antofagasta, *now* the principal sea-port of Bolivia, South America, though at the time of the discovery of the mines it was only known as a port on the coast where the house of Gibbs & Co., of London and Valparaiso, shipped some thousands of quintals of nitrate of soda annually. This product was extracted at a place called Salar, some 17 miles inland from Antofagasta. At that time the population did not exceed perhaps 50 persons; now there are 5,000 or 6,000 inhabitants, with the usual accompaniments of civilization, such as public and private schools, churches, theaters, etc.

The Caracoles mines were discovered in July 1869 by Juan Diae Gana, a Chilian miner, who, contrary to the usual fortune of discoverers, in 1872 realized $1,500,000 for about three-quarters of the interests in different mines and parts of mines he had acquired. Previous to his discovery he had found it difficult to meet the demands of his landlord and tailor, being rather hard up. He was a man of fair education and had been a book-keeper at one time; and his actions, since he so suddenly acquired fortune, show a well balanced mind, good heart, and more than an ordinary share of good, sound, common sense. His first act, after receiving his money, was to relieve in a very generous manner the necessities of some of his relatives, and afterwards to settle down in a quiet, unostentatious way, with but little difference from his previous style of living excepting, perhaps, indulging more frequently in the "Zamba-cueca," the national dance of Chili; but not by any means in dissipation. He named his discovery "Caracolee," meaning in Spanish, "snaile" or "sea shelle," from the great quantity of *ammonites* and other kinds of petrified sea shells which were found by the first prospectors, although the mountains are between 8,000 and 9,000 feet above sea level.

Around Antofagasta, from there to the mines and to the summits of the Cordilleras, some 60 or 70 miles east of Caracoles, the country is a perfect desert. For a person who has always lived in a country where there is vegetation, it is natural to suppose that where there is land, there will be found animals and birds or at least some kinds of insects; but this country is an instance of plenty of solid ground, without a trace of animal life, excepting of course, the kind of animal life incident to the influx of 5,000 or 6,000 people comprising the population of Caracoles. Our informant says that he passed some two months in the district, and in all that time saw only one bird—a kind of hawk—and he seemed to getting away as fast as possible. Rain very seldom falls in that part of the country on the west side of the mountains and water is an expensive luxury. In 1872 it was selling at 50 cents per gallon, and of rather an ordinary quality at that; but considering that it had to be brought about 20 miles on the back of a donkey, whose feed cost 10 or 12 cents per pound, the price was not exorbitant.

Although there have been considerable quantities—in value—of ores taken from these mines, containing from 10 to 40 per cent. in silver, the real value of the mines depends on the great abundance of ore of a medium grade, containing from .001 to .01 of silver. Up to the present time, however, owing to lack of railroad communication, which it is expected will soon be established, ores containing less than .003 of silver do not pay. Some idea of the extent of the district can be formed from the fact that in March, 1872, according to the "Registra de Minas, Official," there had been over 10,000 mines "denounced" or claimed. In more than half of these there were probably "signs" of silver; others were claimed for their location near mines where silver had been found. These claims extended over an area of country nine or ten miles long by four or five miles wide. Of course it is not to be expected that one in ten of these claims will ever be paying mines; but if one in twenty, or even one in forty, should prove to be good, it is still a very extensive silver-bearing region.

The mines have not been developed so much as would be supposed by the amount of capital—nearly $20,000,000—which has been expended upon them, owing to the great number of claims among which this money has been distributed. Probably eighty per cent. of this capital was furnished from Chili, and nearly the same proportion of the inhabitants are Chilians. Through the last six months of 1872 and the first of 1873, those who had furnished this capital began to feel rather doubtful whether they would ever see it again, and mining shares in Caracoles were at a terrible discount in the stock market of Valparaiso; but, during the last six months of 1873 and the first three of this year, the mines had yielded very fair returns—or, at least, quite a number of them have done so. Here is what a correspondent of the *Caracolino*, a mining and commercial journal published in Antofagasta, says of the state of the mines, in April. It speaks of some dozen or so of the principal mines:

Of the Deseada mine the vertical depth is approximately 590 feet. The work is carried on with celerity. The state of the mine, for the abundance of ore already in sight, could not be more favorable. The monthly production of this mine is represented to be from 20,000 to 25,000 marks of fine silver. (One mark equals eight ounces avoirdupois). It can be said, without exaggeration, that the ore already in sight will keep this mine running for some years to come. In 1873 the mine produced 6,052 tons of ore, which contained of fine silver 75,710 kilogrammes, showing an average grade of ores containing a little over .013 per cent. of silver. (920 kilogrammes equal a ton of 2,000 pounds, or 1 kilogramme equals 2.17 pounds). In the first three months of 1874 the production showed an increase of 4,405 kilogrammes over the same months in 1873.

In the "Cautiva" (Captive) mine the production for 1873 was 1,305,389 kilogrammes of ore, producing 11,903 kilogrammes of silver. The first three months of 1874 shows an increase of 1,056 kilogrammes of fine silver over the first three months of 1873. The future of this mine is supposed to be similar to that of the "Deseada."

In the "Flor del Desierto" (Flower of the Desert) they have found the best ores at a vertical depth of 80 meters. They are turning out from 3,000 to 4,000 marks per month. The mine produced in 1873 about 807,766 kilogrammes of ore, producing 9,038 kilogrammes of silver showing an average grade of ore containing about .011 per cent. of silver. Increase of the first three months of 1874 over first quarter of 1873, 512 kilogrammes fine silver. The correspondent referred to speaks very favorably of some eight or ten other mines, and in conclusion draws a very flattering picture of the future of Caracoles. Seen from his point of view, and with his opinion sustained by his statistics, it certainly looks reasonable. Different news, however, comes from the old mining districts of the north of Chili, in the vicinity of Copiapo, such as Chanarcillo, Tres Puntae and Lomas Bayas. All three of these districts are producing small quantities of silver ore of a low grade, and what is still worse for Copiapo, the price of copper is so low in England that many of her mines have stopped work. They have a gleam of light, however, in the long-talked-of railroad from Caldera—the port — passing through Copiapo, which is 50 miles inland, and up through the valley across the Cordilleras into the Argentine Republic. Unfortunately this is only talked of as yet; but there may soon be some action taken concerning it.

Under the Willows.

The recent army-worm scare at Sacramento should teach a lesson of prudence to those who tolerate willow trees about their premises. The worms are supposed to have been propagated in the willows which abound in that vicinity. The willow is a dangerous tree in this respect. There is scarcely a tree to which worms of the caterpillar class resort so much as to this. They, however, do but little injury to it; using it as a rendezvous for their armies, if they do not actually originate there. It being also remarkable for its uselessness, it should meet with little favor at the hands of property holders. We have known cases where one willow tree would harbor caterpillars sufficient in numbers to become a nuisance to a moderate-sized village.

We are not going to criticize the taste which favors this tree, but the same taste can be gratified by the presence of trees of similar appearance, but less objectionable in other respects. Although it is very tenacious of life in spots favoring its growth, it is very exacting in its requirements, and will only grow in such soil as with drainage would produce almost anything in profusion. It is extremely unconguial, unneighborly and "clannish" in its habits; other trees and all kinds of vegetation seeming to shun its presence. There are reasons for suspecting that its influence on animal life is deleterious; for there is scarcely a tree to which men and animals resort less for pleasure or comfort than to the willow.

The basket-willow is grown with considerable profit where the manufacture of willow ware creates a market for it; and we can see no obstacles to the development of this business in California. But the growth of the basket-willow would not necessarily favor the army-worm or any other vermin of the caterpillar kind, the growth being of one season only, and the attention and cultivation which they demand being of a character that allows of no approach of such worms.

LARGE ENGINES.—The new iron steamship "City of Peking," built by John Roach for the Pacific Mail Steamship Company, will have immense engines. Her boilers, 14 in number, were put into her three weeks ago. There are four cylinders, two high and two of low pressure and are respectively 88 and 51 inches in diameter, representing 6,000-horse power. The screw weighs over six tons. The screw shaft is made in sections, is 24 inches in diameter, and extends 200 ft. to the stern. The powerful boilers and pumping engines are placed near the forecastle, abreast of the steerage cabin, and can be used to their full extent, even if the hold is half full of water. As a preparation against fire or leakage, 11 donkey engines have been placed in different parts of the vessel.

QUICKSILVER.—Two hundred and twenty-seven flasks of quicksilver were shipped through Napa during the week ending July 18th, as follows: Redington mine, 185 flasks; California mine, 18 flasks; Phœnix mine, 14 flasks; Manhattan mine, 10 flasks.

The Foot-prints of Pomona in San Francisco.

Apricots still linger about our fruit stands, crowded to the back shelves by some of the latest favorites. Red currants are also with us yet, prices advancing somewhat as the supply diminishes. Blackberries are in their flush season. This fruit is gradually improving under the experimental culture of our fruit-growers, and some of the varieties now in market are exceedingly attractive and luscious; the seed of the berry being scarcely perceptible. Some of the better varieties of pears are finding their way into market, but we can hardly say as much for the apples; still, being aware that the best and most enduring things mature slowly, we await trustfully the approach of the more select varieties of this peer of all fruits. More attractive grapes are now cluttering about the fruit-stands. As to the peaches now being offered for sale, it is to be hoped that the stranger within our gates will not consider them as fair samples of what California can do in this line. The coming peach will undoubtedly be along before another fortnight. A few cherries are left blooming almost alone.

The black currant now appears in our market as a sort of novelty in the eyes of Californians; 25 cents per lb: being charged for the first invoices, and not very good ones at that. We have on former occasions alluded to this fruit, and urged our small fruit culturists to include it in their lists. It is known as one of the most healthful of fruits, and the bush is exceedingly hardy. The strong odor which the foliage exhales not only repels from itself all destructive worms and insects, but is a protection for neighboring bushes and other vegetation. When the currant worm nearly drove the red currant out of the gardens of the East, the black currant remained unmolested. Its peculiar flavor, it is true, requires a little education on the part of the consumer to render it palatable; but when the taste is once acquired it becomes a lasting favorite; and the strong odor from the leaves is remarkably invigorating. In England the black currant is a standard favorite, and is highly esteemed—for puddings, especially. It is hardly an abundant a bearer as its red brother of the garden, but the hardiness of the bush, with its uniformity in bearing, place it among the most reliable of fruits.

We have plums also in market, but they are rather hard and dry. Probably we shall have better by and by, though this is one of the fruits that Eastern people are particularly inclined to crow about when a comparison is drawn between their own fruit and ours. California fruit-growers should look to their laurels in this matter.

THE Kimball Manufacturing company are building the rolling stock for the Saucelito narrow gauge railroad. The business of the Kimball company has increased to such proportions as to necessitate the leasing of the property on Fourth street opposite their works, with a frontage of 130 feet. Their weekly pay roll involves a disbursement of about $10,000. The new buildings will be occupied by the carriage department. The portion of the works vacated by the carriage-makers will be devoted to the manufacture of furniture for the Palace Hotel.

LOS ANGELES.—Says the Los Angelee *Express:* "Los Angeles has a woolen mill, iron foundry, two brick-yards, an ice factory, tannery, two flour mills, two candy factories (wholesale), book-bindery, three daily newspapers, five weeklies, two monthlies, five hotels, three banks, a school house—accommodation for 1,500 children, a large number of wine-brandy distilleries, and is sadly in need of a new theater."

DIEBOLD, Morris & Co., of Canton, Ohio, have been awarded the contract for furnishing the safes for the San Francisco Safe Deposit Company. There is to be one large vault with 4,600 small safes inside it. The contract amounts to $100,000.

IT is proposed to prospect the bed of the Upper Missouri for gold, the idea being that if the Jefferson mines are good and extensive; the bed of the Missouri will prove better and more extensive.

WILLIAM FITCH and H. C. Firebaugh have discovered a chrome iron mine within two miles of Healdsburg. The ore appears to be of good quality, with indications of an inexhaustible supply.

THE Cunard fleet consists of 49 steamers, of 90,000 tons and 15,000 horse power, and employs 6,000 men. Last year the company shipped and discharged 42,000 sailors.

THE Sacramento *Bee* says that those who have prospected and examined, state that within easy distance of Sacramento there are vast beds of iron ore, of the best quality.

J. H. THOMAS, of La Porte, just returned from the East, has effected a sale of the Buckeye claim, Plumas county, to New York capitalists, for the sum of $100,000.

A REDWOOD tree was recently cut near Guerneville, from which was sawed over 52,000 feet of clear lumber.

WORK will shortly be commenced on the branch railroad from Colusa to Woodland.

The Comet and the Weather.

"Is he gone and hath nothing?" —*Mercutio.*

Perhaps some of our readers may have been led to exclaim, on the sudden and quiet disappearance of our late celestial visitor, with Mercutio, after his encounter with the "furious Tybalt," that he has been suffered to take his departure with too little ceremony or note—that he is gone and hath nothing. No doubt astronomers have embraced, to the utmost extent, all the manifold advantages which they now possess over observers on previous occasions, in securing every attainable fact which has been placed within their reach, as to all the various phenomena connected with these curious wanderers in space, and that in due time all the information gained will be spread before the public. These observations will no doubt do much to remove from the public mind the superstition which heretofore has so generally endowed them with attributes of terror, and caused them to be regarded as harbingers of disaster. It is scarcely a matter of wonder, considering the imposing appearance which they sometimes assume, that, until modern astronomy gave us a little insight into their true character, and the laws by which they are governed, they should be looked upon as appearances to be dreaded. Many of our poets, by their bombastic descriptions, have done much to confirm and perpetuate these superstitious notions. Instance the following allusion to several of these visitors by Du Barta:

"Here, in the night appears a flaming spire,
There, a fierce dragon, folded all in fire;
Here, with long, bloody hairs, a blazing star
Threatens the world with famine, plague and war;
To princes death, to kingdoms many crosses;
To all estates inevitable losses;
To herdsmen rot, to plowmen hapless seasons,
To sailors storms, to cities civil treasons."

Happily, however, the day of superstition is fast passing away, and comets are now known and generally regarded to be harmless, homeless wanderers in space, consisting, for the most part, of such attenuated forms of gas that they could scarcely penetrate even the highly rarified substance of the outer atmosphere of this earth; while their tails are literally nonentities, so far as substance is concerned, the mere shadowy reflections of polarized light. They no longer terrify or disquiet, save when ignorance is most gross, and so unnecessarily as to be more deserving of contempt than pity.

Do Comets Affect the Weather?

The attribute of danger from the presence of comets has now been pretty well eliminated from the minds of men; but there is nevertheless a very strong probability that the near approach of one of these bodies to the earth may to some extent effect the meteorological condition of our atmosphere, and thereby cause an unusual prevalence of storms. Either such is the case, or there is a most remarkable coincidence between the occurrence of such things and the near approach of comets, as may be seen from the following recorded facts:

During the presence of the comet of 1783, a very dense fog continued for fully a month over nearly or quite all Europe, Africa and North America. So far as could be determined by the inferior means of observation then available, this fog appeared at about the same day in all this widely extended area. The fog rose above the loftiest mountains; was not dissipated by even the heaviest rains or highest wind. It is said to have been a very dry fog, producing no especial effect upon the hygrometer, and to a certain extent possessing the property of phosphorescence.

The same or very similar phenomena were observed during the near approach of the comet of 1831, the tail of which was thought to have swept over and completely immersed the earth within its supposed substance.

The comet of 1826 was accompanied by unusually heavy rains, and consequent inundations.

The brilliant comet of March, 1843, seemed to have brought with it unusually cold and severe weather. The season was unfavorable for fogs and rains.

That of 1856 brought with it a dense and unpleasant fog, which was very general and lasted three weeks.

The comet of 1861 was noted for a series of tornadoes in regions separated by thousands of miles, and accompanied by most unusual electrical phenomena. Water spouts were numerous, often attended with severe inundations. These phenomena reached their culminating point during the day on which the comet made its nearest approach to the earth.

And now, at the very time when the visitor which has just left us was sweeping by us at its nearest approach, the Storm King has been holding a most terribly destructive course. The eastern side of the continent has been swept by innumerable thunder storms, while scores of human beings have been suddenly struck down by lightning. Every storm that passed seemed to have hurled thousands of thunder bolts upon the earth, scattering dwellings, churches and trees into splinters.

The terrible outburst from the clouds at and around Pittsburg, Pa., surpasses any disaster of the kind, perhaps, of which we have any record, especially in the sacrifice of human life. From various parts of the State of Nevada, from Arizona and Southern California comes the same terrible word of destruction by storm and rain. These storms, so sudden, so much of the same character, so far apart geographically, coming so simultaneously with the nearest approach of the comet, and taken in connection with so many similar coincidences in times past, would seem, very naturally, to suggest, in the mind of the inquirer, some connection between the two. The supposition is barely possible, but we leave the problem to the researches of those especially learned in comet lore.

Ground Sluicing.

Our illustration shows a party of miners "ground sluicing," in the early days of California mining. At that time our system of hydraulic mining was unknown, and the immense beds of gravel now worked were untouched. Then only the richer portions of the high banks were worked by drifts or otherwise, and after the best part was taken out the mine was abandoned as worthless. Ground sluicing was the favorite method employed for washing low banks where the quantity of water available and the lay of the land permitted it to be employed. By this process a comparatively large area of ground could be worked in a short time, the earth and rocks being dumped into the ground sluice and worked out by means of a heavy stream of water. But since the perfection of hydraulicing has been reached, this process of ground sluicing is too slow, and it is only in certain localities that it is ever used. The scene shown in our engraving will be a familiar one to most miners who have worked in the California gravel mines.

MINERS "GROUND SLUICING."

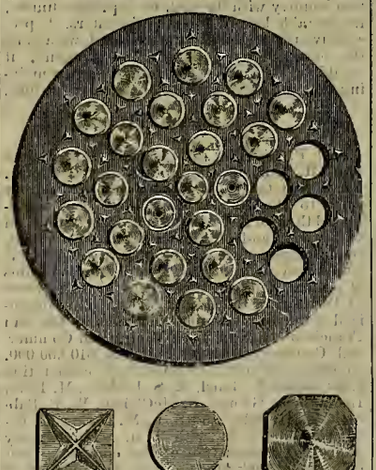
Lynch's Patent Illuminating Tile.

In cities, where every foot of space is utilized, and where every floor of a building, avant to the seventh and eighth stories, yields its proportion of rent and profit, it is also found to be profitable and necessary to construct basement stories and cellars. These basements are at best but dark, cheerless, gloomy places, being only lighted by an overhead dead light or illuminating tile which yields a muffled illumination. This light is usually sufficient, however, to relieve the darkness and enable a person to move around without groping. Besides being dark and gloomy these basements are always damp and have a musty smell because no fresh air, except what passes down through an open hatchway or perchance rushes in through a temporarily open door, can get into them. Mr. William Lynch, of this city, has recently secured a patent through the Mining and Scientific Press Patent Agency for an improved illuminating tile which is also a ventilating tile, being provided with a sufficient number of metal blanks, each of which has a ventilating opening, to furnish fresh air to the basement or cellar.

The illustration herewith given represents an illuminating tile, and the separate diagrams at the side of the tile represent the glass blocks which are fitted into the tile frame, for allowing light to pass through. Mr. Lynch in addition to these glass blocks provides a ventilating block or blank which can be inserted in the frame alternately with the glass blocks, and in the same manner. The ventilating blank is made in the shape of an inverted cup and has an opening in its top.

This cup-shaped block is made of the proper size to fit in the dead light openings of the frame, when it is inverted, thus bringing the bottom of the cup with the hole in it, above the level of the frame and approximately level with the upper surfaces of the glass lights.

The hole serves to ventilate the basement, cellar or other place. As many ventilating blocks are inserted as may be required; and their position can be adjusted to suit, as they will fit in either of the openings in the frame. These ventilating blocks are secured in place with cement or by other convenient means in the same manner that the glass lights are secured. For further particulars address William Lynch, San Francisco, Cal.



Lynch's Patent Illuminating Tile.

Yellow Jacket.—The annual election of this company was held at Gold Hill on the 20th ult. The old board of officers was re-elected. The *News* takes the following items of interest from the reports of the officers:

Balance on hand July 1st, 1873		$37,427 89
Received from assessment No. 16	120,000 00	
" " " No. 17	120,000 00	
Rents and advertising	1,055 50	
From sale of machinery	4,139 43	
From Belcher Mining Co. for hoisting	79,281 37	
		$361,904,19
CONTRA:		
Amount of disbursements for y't	$321,045 67	
Cash on hand	21,428 55	
Stock on hand	19,429 87	
		$361,904 19

Prospecting in the mine has been carried on most assiduously, but with poor success. The lode continues very regular in make and dip, carrying an average width between clay walls of upwards of 300 feet; are now drifting for ledge on the 1,740-foot level, which is 273 feet vertically below the level of the Sutro tunnel. This new level, it is hoped, will carry them below the barren belt which has continued from the 940-ft. or last ore-producing level. They hoisted during the past year for the Belcher mine, 50,127 tons ore. The machinery of the mine, both pumping and hoisting, is all in good working condition.

Crofutt's patent life-protector, which we illustrated and described a short time since, was tested this week by the Chief Engineer of the San Francisco Fire Department. In a room of small proportions smoke was produced from pulu and tobacco, and became so dense that the daylight could not be seen through the large glass door. Then four men, with the protectors over their faces, remained inside for more than half an hour without, as they state, experiencing the slightest difficulty in breathing, and could have stayed as long again with impunity, so that the experiment was a success.

The ore breasts on the 1,300-ft. level of the Consolidated Virginia mine are looking well and yielding splendidly, showing no signs whatever of a diminution in the amount of ore being extracted from that portion of the mine.

New Placer Mines.—A dispatch from Elko, Nev., dated the 27th ult., says: A half interest in a gravel mine in the new placer mining district, 70 miles north of here, on the head waters of the Bruno river, was sold to day for $60,000 to a San Francisco company. These mines were discovered last fall, and but little confidence has been felt in them until very recently, when developments were made showing a 15-foot bed of gravel carrying from ten cents to a dollar to the pan. The new diggings are very extensive, covering an area of ten miles, and are situated on a high plateau between the head waters of the north fork of the Humboldt and Bruno rivers, the latter being a tributary to Snake river. A genuine gold fever is now raging, and the prospectors are making locations rapidly; but owing to the scarcity of water very little can be done this summer.

R. E. Osgood, contractor and builder of bridges, commenced, on Monday, the construction of the two large bridges near the beach for the San Luis Obispo Railroad Co. The first bridge is 1,000 feet in length and 50 in hight, and the second 900 feet in length and 40 in hight.

Mexican Mines.—A Mazatlan correspondent says: Of mining reports, we hear that the new gold diggings discovered near Chororse, in Chihuahua, give brilliant returns, nuggets of two pounds' weight having been found. An American company is now working the silver mines of El Parral, and other American companies are working different mines in the Sierra Madre. At Zacualyan the famous Alaeran mine is again in *bonanza*, but the same cannot be said of the Alaeran mine, in this State, worked by an American company, though offering good prospects. There is much American capital invested in Mexican mines, particularly on this coast, in Sinaloa, Sonora, and Lower California.

Anthracite.—The Puget Sound *Courier* says a party of explorers, who recently left Olympia in search of anthracite coal, have returned, bringing with them specimens of the croppings of a coal vein, which bears a nearer resemblance to anthracite, both in appearance and specific gravity, than anything heretofore discovered in the Territory. And what is still more in its favor is that it is nearer the Sound than the Packwood discovery, and there is an easy grade for a railroad from Olympia to the mine, and a direct and practicable route to Walla Walla. Five veins of lead ore have been discovered but a few miles from these coal deposits.

The Cedar Creek company have started up and commenced piping in their lower claim, the Yankee, having made the first connections with their tunnel. They are using one of Hoskin's Little Giants with 510 feet pressure in the discharge.

A large invoice of California furniture was shipped by J. C. Palmer & Co., of this city, to the Sandwich Islands during the week. This firm is also making a superb mantel of California laurel, to be sent to England as an example of California wood and work.

The Panamint Mines.

From a letter written by J. W. Whitlatch, published in the Enreka *Sentinel*, we meke the extracts given below. We may state that Mr. Whitlstch, who is connected with the California ore sampling works of this city, has made several extended trips through the various mining districts in the southern part of the State, and has carefully examined the prospects of all. He says: I have been to Panamint district, and have given it a searching investigation. It is a fine prospect on the surface, but I do not believe the mineral will extend to any great depth. I am satisfied the lodes will go down, but am afraid the mineral will not. In every case where sinking has been done to the depth of 20 feet, the ore becomes poorer in most of the leeds. Still, there is mineral as far as any sinking has been done, but it is confined to lines or streaks, not extending through the whole mass.

The Wonder of the World, or, as it is commonly called, "Jacob's Wonder," is a fair representative mine of the district. The mineral is a black, copper ore, and the vein carries considerable silver or carbonate copper in spots, while on the ontside nearer the wall rock the quartz is barren. It is fair to say that out of seven feet two is good ore; but not much, if any more will pay. The Mexicans have been running a sort of smelting works, which is but a small concern run by an ordinary 46-inch bellows. They have also an arrastra which they have been working. Two tons of ore, selected as a sample of the best ore, were taken from the Hemlock and sent to Cerro Gordo and produced $490. This, I should say, was a very good general sample of the district. Some portions may be better, others poorer. Black lime is found mixed through the ore deposit and large bowlders, weighing from three to four tons, appear on the surface. Between these bowlders, streaks, two and three feet in width, of chloride, rich as any ever found in old Austin, are found. What we used to call bromide silver is also found. Take any of this ore and put it in a forge and it will blister out equally as well as the old Yankee Blade ore of Union district. It is impossible for any one to make head or tail of this singular deposit, still I think they will succeed in finding a defined lead. At all events, the owners have a fortune in sight—at least $50,000. The ore appears to be a grayish looking sulphuret; the quartz is white, of a fine, soft texture, fully charged with mineral, and will yield 80 per cent. of its metal by the ordinary mill process.

The road to reach the Panamint mines is hard to travel—heavy sand and high mountains to pass over. The distance to Tulare, the present terminus of the railroad, coming from San Francisco via Bakersfield and Havilah by stage to Indian Welle, is 140 miles; from Indinn Welle to the mines, over a frightfully heavy, sandy road, 80 miles; and coming in by way of Los Angeles it is all of 250 miles.

Panamint valley is 1,350 feet above, and Death valley, on the east side, is 240 feet below the level of the sea. The mines are situated all the way from 6,000 to 8,000 feet high. The major part of the mountains, until you have attained an elevation of 7,000 feet, are barren of any soil or earth—all solid rock. The hill sides are so steep that it is impossible to take a horse to any of the mines, without first making a trail. A good road is built in Surprise canon from Panamint valley to the spot selected for the town site, at the upper springs.

I have no doubt but what a general stampede will occur sooner or later to this place, but not until next spring, as no money can be made until the machinery arrives and is put in operation.

Any one putting up a mill in Panamint now would certainly make a fortune; as the chance for ore to mill is a "dead shot," and can be furnished in abundance. I visited thirteen mines or prospects that show a large quantity of rock, and the chance for mining good ore out of any of the mines is splendid. Nature seems to have done for this camp more real prospecting than any place I ever saw.

The greatest expense will be to build roads to and from the mines, in order to get the ore to the mills. The mines are scattered over a large scope of country, although you can go to the summit of the mountains and take in the whole country. Still, it will require, at least, five days of hard labor to get to all the mines. I did four of the hardest days' work I ever accomplished in my life, to see for myself the different locations. On a clear day, by going to the summit of the mountain, Ord District, Ivanpaw, Cerro Gordo, the Sierras, and the Fort Tejon mountains can be plainly seen. Death valley stretches its barren waste along the eastern base of the mountain, and west of the valley. But little grass is found in the country, and provender for animals will always command a high price. I am convinced that it will be a rich camp.

John Martin and W. B. Pierce have discovered a rich ledge 15 miles from Holcomb valley, or 30 miles from San Bernardino. Tests have been made of the ore, some of which goes as high as $150 per ton, and averaging, all through, $50.

Varnish for White Woods.—Dissolve three pounds of bleached shellac in one gallon of spirit of wine; strain, and add one and one-half more gallons of spirit. If the shellac is pure and white, this will make a beautifully clear covering for white wooden articles.

Prospects of our Mining Counties.

The Calaveras *Chronicle* says: The present condition of our mining counties is not very encouraging. People are continually leaving. Rivers whose beds 12 or 14 years since were turned for miles, and whose banks were the scenes of great activity, are now quite deserted. One may travel for miles seeing naught save the traces of former settlements, dismantled, roofless cabins, lone chimneys, and the graveyards on the hillside. They hold nearly all that remain. It is quite similar with many camps in the upland dry diggings. Places formerly containing a population numbering several thousand, are now concentrated about a nucleus of a few saloons, stores, the post-office, express office and other establishments necessary to supply the wants of the sparse surrounding population. In the country deserted ranches are ominously frequent.

We believe that this condition of affairs will only be of temporary duration. These localities contain the elements of great wealth and prosperity. The production of mineral is not exhausted. On the mountains may be grown fruits and vegetables peculiar not merely to our own latitude, but to that of the tropics. These also are of superior quality. Grapes grown at the elevation found here make a wine superior in flavor and of more body than can be produced in the valleys. The mountain potatoes which are raised 15 or 20 miles east of Sonora, Tuolumne county, and which can be grown throughout the foot-hill region, rival those of Nova Scotia, the favorites of the New York market. Following up from the foot-hills the gradual elevation of the western slope, we pass through many gradations of climate. At one level are found only the wet and dry season of California. Less than 30 miles distant to the westward, and 2,000 feet of elevation, afford us a climatic alternation closely resembling spring, summer, fall and winter of the New England year.

The communication by railroad with the East being long since completed, the rush of immigration hither has been immense. Thousands upon thousands have been added to our population. They are aware that gold still exists here, and gold yet possesses for the Eastern immigrant a powerful attraction. Of course, the rich lowland valleys, capable of producing the cereals, will be filled up first, but this influx must spread to other sections. They will be forced to these mountain ranges. Land here will be cheap. The soil is generous in yielding a subsistance. Many a solitary miner supplies himself with vegetables by a few moments of labor each day, on a little plat of land. Men will buy with their acres indications at least of the presence in the soil or ledge of gold, silver, copper and other minerals. The chances of such wealth will lend additional value to their possessions. The turning up of the soil will from time to time reveal such treasure. The construction, by the miner, of the long line of ditches affords great facilities for irrigation.

Can it be that a region possessing all these and other advantages we cannot here mention should remain long unappropriated? Were it possible to transport a section of this mountain country with its soil, its equable climate, its desirable lack of long, hard winters, its prospective underground treasure, set down among the bleak barren hills of New England, it would by contrast seem, even though remaining wild and uncultivated, an earthly paradise.

The Diamond Fizzle.

Joel F. Lightner has brought suit against Wm. M. Lent, in the Fourth District Court. Plaintiff states in his complaint that shortly prior to the 30th of July, 1872, Lent represented that he had recently purchased mines of vast extent, and of almost fabulous richness, containing an inexhaustible quantity of precious stones and gems, of the value of many millions of dollars, situated somewhere in some State or Territory of the United States. Lent organized a corporation under the name of the San Francisco and New York Mining and Commercial Company, with a capital of $10,000,000. In order to inspire confidence in the corporation Lent caused A. Gausl, M. S. Latham, M. Dore, Louis Sloss, George B. McClellan, W. F. Babcock, T. H. Selby and S. L. M. Barlow to become co-directors with him. Immediately after the organization of the company, Lent offered the stock for sale in the open market at $40 per share, gold coin. That, in order to induce people to purchase the stock, Lent represented that whoever purchased any of his stock in the company would only pay the price that it cost him. During the time Lent was offering the stock for sale he kept on exhibition at his office a collection of diamonds, rubies and other precious stones, which he represented were the products of the mines, and to the value of $750,000. Lightner further says that, relying on the statements of defendant, on the 8th of August, 1872, he purchased 500 shares, and paid him through his authorized agent, the sum of $20,000. Lightner says that the precious stones exhibited to the public were procured in London, or other markets of the world, and were sent to San Francisco for the fraudulent purpose of causing it to be believed that they had been procured from the mines. That the collection did not exceed in value the sum of $5,000. That the corporation did not own any mine of precious stones, as represented, and Lent refuses to return the money. Plaintiff asks judgment for $20,000, with interest from August 8, 1872, in gold coin.

Mica.

This mineral is sometimes erroneously called "isinglass," "muscovy glass," etc. Its name signifies to shine, to glitter, from this conspicuous characteristic which it possesses; it is of common occurrence in primitive and secondary formations; is one of the chief constituents of granite, mica-schist, and, to a small extent, of gneiss. In limestone it forms masses, pockets, beds and veins, often of considerable size. In granite the plates or crystals are small, mostly under an inch in diameter, though in some coarse granitic formations a foot and upward. In Siberia plates have been met with as much as five and seven feet across.

The group of micas may be classified in two divisions. Those which are silicates of alumina and alkalines, as muscovite, lepidolite, and the magnesian micas, as phlogopite, biotite, etc. All are readily distinguishable for their brilliant lustre or glitter, whence the name, as well as for their very distinct cleavage in one direction and tough foliaceous structure, which permits of separation into very thin sheets. The two species described below are very valuable in commerce.

Muscovite is essentially a silicate of alumina and potash, with occasionally a small and varying quantity of iron, traces of fluorine, and in some of the green varieties chromium; crystallization, trimetric, usually six-sided tables; color, black, brown, silvery-white, gray, green, with pearly, pseudo-metallic lustre; not attacked by acids; refractory, only fusing on thin edges before blow-pipe; laminæ very tough and flexible.

Phlogopite. — Magnesian mica; composition, silica, alumina and magnesia, with traces of iron, potash with soda and fluorine; crystallization similar to the foregoing; color, brown, reddish-brown, yellowish-brown, olive-green, gray, with pearly lustre; whitene in blow-pipe flame and melts on thin edges; when reduced to a fine powder, attacked by hot sulphuric acid, the silica separating in thin scales; also like muscovite, so tough and elastic that it can be split into sheets of extreme tenuity. This species is mostly found in limestone.

The early history of mica and its uses are obscure. But the researches of Professor Kerr in North Caroline have brought to light very ancient and probably the remains of the most extensive mica mines that are known in any country. These operations were invariably in ledges of coarse granite which contain nothing but patches of mica. The size and number of these mines are said to be remarkable; some of the open cuts are 100 feet in diameter and 30 feet deep. Tunnels also of considerable length exist, though too small to permit an ordinary-sized man to work in, but showing distinct marks of a chisel-shaped tool about an inch in breadth in the granite wall. A quantity of mica platee have been found in these works; some trimmed to particular shapes have led to the conjecture that the uses to which it was applied was for windows, mirrors, ornements, etc. The magnitude of the operations excites surprise, and shows that a large demand must have then existed.

In more modern times the use of mica was chiefly for windows of war-ships, lanterns and other conditions liable to concussion; but recently it has been applied to a variety of useful purposes and has acquired a very considerable value, so that in times of scarcity good qualities have sold as high as $10, $15 and even more per pound. The value of mica is determined by the color, size, soundness and toughness; the most transparent, large, sound sheets being in highest estsem. The chief consumption at present is for stove glass. Without mica we should lack the cosy, ruddy, genial glow of the base burning and other illuminated stoves. The quantity consumed annually in this branch it is difficult to ascertain, but it is necessarily very large. Coarsely pulverized, it is found to be an excellent roofing meterial (far superior to ordinary gravel), to which use it is also applied in the same manner as slate. It makes, when finely ground, a good lubricant for certain purposes. It is superior to card-board for marine compass dials. Formerly it was largly used as a filling for fire-proof safes. It is also used in the lettering of fancy signs. When very clear, it forms a better protection to photograps then enamel. But by far the most artistic application is in the manufacture of lamp shades. With the aid of chromo-lithography exquisite pictures are printed on sheets of mica, three or four of which are tastefully joined together, and form a really beautiful design.

Mica now is eagerly sought for to supply the large and increasing demand. Active operations are being carried on in various places, particularly in North Caroline, New Jersey, etc.; also in several places in Canada.—*Paint and Oil Trade.*

San Francisco district, adjoining Star district, Utah, is looking up. Parties are starting in to work their claims; there is a good character of ore, free gold, copper and plenty of silver; but it needs capital to take it out and work it.

Mining prospects from all parts of Utah Territory are very promising. The *Mining Gazette* says: "The various reports from Bingham, Dry Canon and Ophir, all betoken a revival of interest in Utah mines, some of the reported developments being of extraordinary character."

Another water ditch is being constructed from Santa Ana to Riverside.

Bullion from Eureka.

The *Sentinel* of the 19th says: The bullion produced for the week ending last night was as follows: At the Richmond, 2 furnaces, 244,190 pounds; Eureka Consolidated, 2 furnaces, 160,000 pounds; Ruby Consolidated, 82,963 pounds; Hoosac, 4 days' run, 40,000 pounds. Total, 527,153 pounds. Besides these amounts, there is a surplus, smelted during the month: At the Richmond, 360,000 pounds; Eureka Consolidated, 64,495 pounds; Ruby Consolidated, 126,619 pounds; Hoosac, 20,000 pounds. Total 571,564 pounds.

The bullion shipments during the past week were: Richmond, 520,945 pounds; Eureka Consolidated, 160,390 pounds; Ruby Consolidated, 94,668 pounds; Hoosac, 20,024. Total, 796,027 pounds; which, owing to the stoppage of three furnaces during this time, is not an average week's business. The furnace of the Hoosac company was shut down on Thursday last for the purpose of re-lining, and will not be started up again until Saturday next. Two others, one at the Richmond and the other at the Eureka Consolidated, were not in operation until yesterday. The Ruby company's furnace closed last night for six weeks, during which time the place will be overhauled and the furnaces refined. At the Silver West furnace, recently re-leased by the K K Con. company, the machinery, engine and stock are being cleaned up and put in repair preparatory to starting up on or about the 1st proximo. At present there are six furnaces in full blast, which number will be increased to ten in a short time.

Belmont Mining Items.

The Belmont *Courier* says: The mining interests at Jefferson are daily improving and business of all kinds increasing. The Prussian South mine is showing better ore as depth is attained. It is increasing in richness to such an extent that a statement of the actual value of the ore, per ton, now being extracted, would be discredited. The property is destined to become of immense value before long. The Prussian is looking splendidly also. In fact, every location in the district, and particularly on that belt, now being worked, is affording flattering prospects for the owners. There has been quite an accession to the population within ten days past. Once the machinery for the mills and hoisting works begins to arrive, Jefferson will present life and activity.

The machinery for the mill and hoisting works for the Prussian South mine company, at Jefferson canon, has been purchased in San Francisco, a portion of which has been shipped. In consequence of the great rush of work at the foundries in San Francisco, the company will probably be delayed somewhat in having their order filled. The delay will be of short duration, however.

Of the Belmont mine there is nothing to report, further than drifting is progressing north toward the Moore & Martin ground on the lower level. The building over the new perpendicular shaft is nearing completion. The boiler is set and the shaft about completed. It will be but a short time before the machinery will all be in order and the new shaft in use.

Heat on the Comstock.—The Virginia *Enterprise* says: Since the setting in of hot weather the heat in the lower levels of our mines has been much intensified. One would not suppose that there would be much difference in the temperature, winter or summer, at the depth of 1,500 or 2,000 feet below the surface, but there is in reality a vast difference. This, however, is probably more owing to the difference in the temperature of the air pumped into the mines than to a difference in the heat of the mines themselves. The surface air now pumped into the lower levels being of a temperature of 80 to 90 degrees, it cannot be expected that it will cool off the sweltering lower regions to the same extent as air of the winter temperature—30 or 40 degrees. At present it is pumping air standing at 80, 90 or 100 degrees into an atmosphere heated to about 110 degrees, therefore the air introduced from the surface is able to but slightly reduce the temperature in the lower levels. Large air shafts, similar to that being constructed by the Belcher company, are what are needed. There should be several of these along the lead, with connections running through all the mines between them.

Collapse of a Miners' Bank.—The Trinity *Journal* says: Miners living remote from banking-houses or other depositories are in the habit of burying their gold dust and money, not considering it safe to leave it in their cabins while they are away at work. Jack Reed, living on Buckeye creek, had more money than he cared to carry about in his pocket, so he pieced it in a yeast-powder can and buried it a short distance from his cabin. Several times Jack had occasion to visit his deposit—sometimes adding to his store, at others taking therefrom, but always placing it in exactly the same spot. A few days ago he went to get it, but the can and contents were gone, although the hole had been filled and the ground leveled as when he left it. Calling friends to his assistance, a vigorous search was instituted, the ground dug up for several feet around, but to no purpose. Mr. Reed and his friends are of the opinion that some one accidentally saw him bury the can, and as soon as he was gone, dug it up. The can contained 18 ounces in gold dust and $100 in coin—about $415 in all.

Banking.

Anglo-Californian Bank,
LIMITED.
Successors to J. Seligman & Co.
London Office.....No. 3 Angel Court.
San Francisco Office.....No. 412 California street.

Authorized Capital Stock, $6,000,000,
Subscribed, $3,000,000. Paid in, $1,500,000.
Remainder subject to call.

DIRECTORS IN LONDON—Hon. Hugh McCulloch, Reuben D. Sassoon, William F. Sebolfield, Isaac Seligman, Juline Siugton.
MANAGERS:
F. F. LOW and IGNATZ STEINHART,

Ayer's Sarsaparilla,
FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into tronblesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

conntv lying across the range, and contiguous dietricts heyond, continues.

THE reason no reports of bullion shipments have been made for two weeks from Stewart's is becanse the worka have heen undergoing the "cleaning up" process. They are in full hlsst again, and the usnal shipments will soon grace the head of this colnmn.

A MILL run of nearly four tons of ore from ths lower leval rnn from the hottom of the Weaver shaft in the Colorado central lode, 135 feet from the snrface, gave 637 onnces of silver to the ton, and 46 per cent. lead.

Oregon.

ELK CREEK DISTRICT.

ELK CREEK—GOLD BAR.—Bed-rock *Democrat*, Jnly 22: On Monday last we were shown a gold bar, assayed at the hanking honse of J. W. Virtne, of this city, for Mr. John Roy & Co., of the Cahell ledge, sitnated on Elk creek. This is the hig ledge spoken of in onr last issue. The har is worth $2,000, and is the result of one and a half days' rnn with an 8-stamp mill, crushing nins or ten tons of rock. The Cahell ledge on the top of the gronnd presents one mass of rock ahont three hundred feet in width. The rock is crushed at Dr. F. C. Horsley & Co.'s mill, within one-quarter of a mile of the ledge. The cost of getting out and delivering the rock to the mill does not exceed $2 per ton. There is hnt little donbt but what, with proper development, the Elk creek district will nltimately prove itself to be one of the richest on that coast. There are ahont 30 persons working on Elk creek and vicinity, prospecting and developing ledges. The place where the mill is located is called Goldville, at the old site of Grant city, between this and Cañon city. There are five or six placer mines now heing worked there, and gold is coarse, and gronnd inclined to he spotted. Rock was crushed at the mill, last fall, for Cressup, which paid $21 per ton.

Utah.

AMERICAN FORK DISTRICT.

THE MILLER MINE.—Cor. Salt Lake *Tribune*, July 23: Thie mine is and always has been the leading mine of the camp, bnt the old Miller ground property is lying idle, and the company is now working oo the Wyoming gronnd, they having bought it some time last winter.

THE Wild Dutchman, under the charge of Mr. Haskins, not long since "got in" on another big body of rich ore. Last summer a deposit was taken out amounting to several thousand dollars, and shipped to the Snltaua works; but the present one discounts that all to pieces.

THE Sierra mine, on Miller hill, lately strnck some good ore in the main tunnel. It is one of the few trne veins of Utah. A straight tunnel has been run on the vein 130 feet, showiug ore all the way—sometimes hut a few inches, and then epreading over two feet.

THE Mary Ellen and Live Yankee, the property of Col. Nuckolls, Gilman & Co., have heen working a large force, and hringing forth ore with a good sprinkling of gold through it. Rnmor hae it that these two mines, with the Pittsburg, are ahout to transfer to an Eastern company.

THE Snltana smelter, at Forest City, is in full blast, that is, two of the three fornaces, on Miller and Wild Dntchman ore. Several tons of bullion are daily tnrned out, and shipped per American Fork narrow gauge.

AT the Crown Point mine entirely new machinery has heen put in for hoisting throngh the main incline. This machinery is now nearly completed, and is second to no hoisting machinery in the State.

IMMENSE businsss is now being done in the canning of salmon among the fisheries on the lower Columbia. The warehouse at Astoria is jammed full of cases, ready for shipment.

THE furnace at the Brownlie mine, near Vallejo, is completed. The company will soon be making regnlar shipments of qnicksilver to market.

A SUFFICIENT amonnt of ore will be hoisted from the Crown Point mine, pending the introduction of the new machinery, to keep the Mexican mill running.

A NEW oupola furnace of 4,000 pouads capacity, and a 10-horse power engine, have heen pnt up in the molding department of the Napa Plow Co's worke.

THE Wilson hrothers, of Shingle Springs, El Dorado connty, design estahlishing in Chico a mammoth sash, hlind and door manufactory.

THE reducing works of the Cerro Benito quicksilver mine, Fresao connty, resumed operations last week.

THE Redington Qnicksilver Mining Co. have declared a dividend of $20 per shara, payahle on the 31st.

THE 1,400-ft. level of the Crown Point mine continues to open np freely, and promises a free yield of rich ore for months to come.

A SIXTY-OUNCE chunk of gold was found recently in the Bald Mountain mine, Sierra county.

WOOD is retailing in Austin at $10 to $11 per cord.

General News Items.

THE CLOUD-BURST AT EUREKA, NEVADA, was one of the most disastrons occurrences of the kind ever noted on this oosst, and needed only the necessary improvements and popnlation along its path to have fully eqnalled the horrors and destruction witnessed at Pittsbnrg, or the Mill river disaster. The fnry of the storm seems to have concentrated at and jnst above the town. Ths main street of Enreka was, for a short time, filled by a rnshing, turhnlent stream of water, and wheraver any temporary obstruction was interposed, there was soon snch an accnmulation of force that everything had to give way before it. When the water subsided, the scene presented a dreary tale of desolation and misery. Articles of furnitnre, portions of dwellings, trunks, heds and hedding were mlxed with a perfect sea of wood, rocks and sand. The presence of thieves and plnnderers also added their atrocitiee to the calamity. The following lives are known to have been lost: Mrs. Charles Bray, A. C. Latson, John Tnrner, Roger Rohinette, James Galvin, J. W. Talbot, Jean Dorney, John Ranfts, W. J. McGeary, Wm. Smith and five Chinamen. There is no donht bnt that several more bodies will be fonnd bnried in the debris. It is reported that the bodies of a woman and two children were found on Sunday. The damage to property will exceed $150,000. The general hnsiness of the town will also he diminished, and it will he at least a month hefore hnsiness is renewed and everything in proper working order once more.

THE Beecher-Tilton scandal still "drags its slow length along." Nothwithstanding all that has heen pnhlished up to the present time, pnblic opinion is quite as much divided as ever. A contemporary enms up the whole matter as follows: Tilton says Beecher did; Beecher denies, and says he didn't; Mrs. Tilton says that Beecher didn't. There is an awful lia out, and who hss told the lie remains to he seen. It seems to us that Mr. Frank Moulton, who wae the mutual friend of the Tiltons and of Beecher, during the whole of the scandal talk, can settle the question and saddle that lie on the hack ou which it helongs.

RAIN AND RUIN.—Fearful storms and cloudhnrsts have occnred in various sections of the country during the past week. The most disastrous one occurred near Pittshurg, Penn., where it is reported nearly 200 lives have heen lost. Several lives were lost at a similar occasion at Eureka, in the State of Nevada. Another took place at about the ssme time four miles west of Carson. Heavy rains have fallen in many portions of Arizona. A water spout hurst in the Colorado desert, in San Diego Co., which came near sweeping to destruction the mail carrier with his team and the mails.

THE matter of protecting the Yuha river from overflow is now heing discussed hy the farmers on hoth sides of the river. The residents of Linda township, affected hy the overflow from the Yuha river, are ahout calling a public meeting in their township to take into consideration the qnestion of preventing further damage to their farms. They propose to appoint a committee to consnlt with the hest legal talent in the State and obtain their opinion as to their rights in the matter.

THE flax mills of the north of Ireland, generally, have snspended mannfactnring linen, and thonsands of weavers and other hands are thrown ont of employment. The market for Irish and Holland linen has become much depressed. It is stated the flax-growers of Ireland are ahout giving attention to the growth of the ramie plant, which on the low lands and river hottom lands is snpposed to be well adspted to the climate of Ireland; possibly to snpercede the cultnre of flax altogether.

THE STATE UNIVERSITY—IMPORTANT AOTION OF THE REGENTS.—The Board at their meeting, July 24th, appointed Wm. Ashbnrner, Professor of Mining, and decided to appoint eight lecturers on topics relating to agriculture—four to he chosen from California, who are hest informed npon local vegetation and culture, and four from eminent scientific men connected with the hest agricnltural schools in the United States.

THE CARLIST WAR—REPRISALS.—It is reported that the Carlists have again heen hadly heatsn by the Republican troops, and snstained very heavy losses. Two companies of Carlists, who refused to snrrender, were cut in pieces. Forty-one Carliste, mostly members of the nobility, have heen arrested at Barcelona, by way of reprisal against the inhuman conduct of the Carliste.

THE WASHINOTON MONUMENT.—Ex-Governor Shepherd hae resigned his position as Director of the Monument Association. Subscriptione tofinish the monument under the new plan are coming in with gratifying rapidity. Preparations are making, however, to renew the demand on Congress for aid at the next sessiou, in the event that the new plan is not entirely snccessful in eecuring sufficient fnnds.

WHAT NEXT?—And now Sonth Carolina has its plague—caterpillars. Fears are entertained that they will sweep the State of its cotton crop. Hydrophohia, grasshoppers, Plymouth church scandal, Indians, lightning, floods, marine disasters without number, disastrous fires, etc.—the list is growiug lengthy, and the question naturally arises, what next?

A NEW town is heing laid out on the Cucamongo ranch, Los Angeles county.

MELANCHOLY SUICIDE.—A melancholy enicide occurred in this city on Satnrday last. Mr. Wm. B. Bonrne, an old and well-known citizen and large capitalist, shot himself dead in his house on Taylor street. The act was supposed to have been done in a fit of temporary insanity. Mr. B. left property to the amonnt of over one million dollars.

NEWSPAPER ENTERPRISE.—The London *Daily Telegraph* announces that arrangements have been concluded hetween the proprietors of that paper and Mr. Bennett, of the New York *Herald*, nnder which an expedition will at once be dispatched to Africa, with the object of pnrsuing the fulfillment of the magnificent discoveries of the great explorer, Dr. Livingstone.

PHENOMENON IN WASHOE LAKE. — All the fish in Washoe lake appear to have died, and the shore is lined with their decomposing remains. It is sunposed that the phenomenon has been cansed hy the eruption of some poisonous gas from the bottom of the lake.

EASTERN capitalists pnrpose establishing a cheese factory in Del Norte county. The Crescent City *Courier*, of July 18th, states that nearly 1,000 cows have heen promised to the proprietors, if they will estahlish snch an enterprise.

THE vineyard of Gnstave Mahe, a mile out from the town of San Mateo, contains 70,000 vines. Last year Mr. Mahe made almost 5,000 gallons of wine, and this year he expects to make 7,000 gallons.

THE Napa *Register* says a pretty young miss of Napa city is wearing a straw hat, the prodnct of her own skill and taste, the raw material of which is of California growth.

RUSSIA ANN CHINA.—Prussian jonrnals say that a war between Russia and China is inevitahle, in consequence of the designs of the latter on Kassgar.

A heet-sngar factory, similar to that in Sacramento, will probahly be erected near Davisville, as a company is forming for that purpose.

IN Arkansas much damage has bsen done hy drouth. Wheat turned ont well; oats moderate; corn tolerahle; cotton small and clean.

SUN-STROKE.—Ahout 20 cases of sun-stroke have occurred in St. Louis since Saturday, one-half proving fatal.

ANOTHEA ROTHSOHILN GONE.—The telegraph reports the death of Anselm Rothschild at Vienna, on Monday last.

BISMARCK.—A dispatch saye Bismarck is improving, but the wound unhealed; the Prince cannot write.

PROSPECTING on the 1,500-ft. level of the Beloher will he commenced in a very short time.

WATERMELONS weighing as highas 60 ponnds have appeared in the Marysville market.

THE wharf and warehonse facilities of South Vallejo are to he increased.

A CAR-LOAD of Vermont sheep arrived at Marysville on Monday.

WILN coffee trees are thriving finely on the shore of Clear lake.

FARM laborers are in demand in Elko county, Nevada.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIO PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Speoial Diapatch, Dated Washington, D. C., July 28th, 1874.

FOR WEEK ENDINO July 14th, 1874."

BILGE WATER GAUGE.—Wm. G. Conkling, Washington Territory.

PROCESS AND APPARATUS FOR MANIPULATINO THE ORES OF MERCURY.—Henry H. Amss and Russell D. Walbridge, Oakland, Cal.

OIL CAN STOPPER.—Joseph F. Donkin, Grayson, Cal.

MILK STRAINER.—Joseph F. Donkin, Grayson, Cal.

PROCESE OF REFININO ANN PURIFYINO LEAN.—Alex. H. Everett, S. F., Cal.

CHILDREN'e CARRIAOE.—Adam Heim, S. F., Cal.

GANO PLOW.—Wm. O. M. Berry, S. F., Cal.

MEDICAL COMPOUND.—Henry M. Hoyt, Koight's Landing, Cal.

---

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possihle (by telegraph or otherwise) at the lowest rates. All patent business for Pacifio coast inventors transacted with perfect secnrity and in the shortest time possible.

THE SCIENTIFIO PRESS.—This valuahle journal entered upon the seventeenth year of its publication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessry to make any splurge of improvement, and the pnhlishers simply content themselves with the announcement that they will continue to make their paper as interesting as possihle, That it is interesting to a large class of readers, the wide circulation and extensive influence of the PRESS, is sufficient evidence.—*Placer Argus.*

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has heen repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the hest editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIO journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

ining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit hy its illustrations and descriptions of New Machinery, Processes, Discoveriee and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 224 Sansome street, S. F.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFIOE, 224 SANSOME STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an ahle, responsible, and long-established firm, and the prinoipal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, hesides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well he thus illustrated. It must not exceed 12 inchee in length or hight. When practicahle, a smaller model is even more desirahle. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (hy express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIO PRESS OFFIOE, SAN FRANCISCO," At the same time, send a full description, embodying all the ideas and claims of the inventor rsspecting the improvement describing the various parts and their operations.

Also send $15 currency, amonnt of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents mads np, and soon sent to the inventor for signing.

As soon as signed and returned to ns with the fees then due ns, it will he sent straightway to the Patent Office at Washngton.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should he made np with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illnstrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIOHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and aleo of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawinge ara necesaary. In such case, the applicant hae only to send us an exact description, and what is desirable to claim.

Address DEWEY & CO.,

PUBLISHERS, PATENT AGENTS AND ENGRAVERS,

No. 224 Sansome street, S. F.

New Inventions!

Of real merit, if brought plainly before the pnblic when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the PRESS. Superior Engravings Made, at reasonable rates, hy artists in this office. hp-tf

The MINING AND SCIENTIFIO PRESS, San Francisco, Cal., Dewey & Co., is a rich *placer*, wherein golden information may be found, valuable to any searcher after knowledge.—*Newark Manufacturer.*

GENERAL MERCHANDISE.

WEDNESDAY M., July 29, 1874

Bags are in good demand at noted quotations. Large arrivals have recently been made, but the market continues strong. Coal is unchanged. Coffee is firm. The great excitement of the week has been the upward tendency in the price of Sugar and Syrups; the former have been advanced to ₱ lb all around, and the latter about 70 per cent. The rise is not unexpected, but is rather larger than was thought would be the case.

PACIFIC RURAL PRESS,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, $4 a year.

DEWEY & CO., Publishers,

No. 224 Sansome street, - - SAN FRANCISCO.

Removal.

July 13th, 1874, the business office of this Journal was removed just one block east of our former location, to No. 224 Sansome Street, southeast corner of California, over the Bank of British Columbia, where we have secured large and elegant quarters. This removal is made in consequence of the sale of the building which we formerly occupied, to parties who will procead immediately to demolish the present structure and erect a new and magnificent block in its place.

THE NEW WINCHESTER REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency

NO. 108 BATTERY STREET, SAN FRANCISCO.

The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE.

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inside works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 21 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Cartridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency.

JOHN SKINKER,

Sole Agent for Pacific Coast,

NO. 108 BATTERY STREET, SAN FRANCISCO.

NOTE.—Also Agent for the Dupont Powder Company and Eagle Safety Fuse Manufacturing Company.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notices under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Eagle Quicksilver Mining Company.—

Location of works, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

NOTICE.—Is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 1874, an assessment, No. 8, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessment shall remain unpaid on Monday, the 21st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 28th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H WATSON, Secretary.

Office, Rooms 5 and 6, No. 302 Montgomery street, San Francisco. jy-25

South Fork Mining and Canal Company.

Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 30th day of May, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificats.	No. Shares.	Amount.
James Adams	8	1,000	$50 00

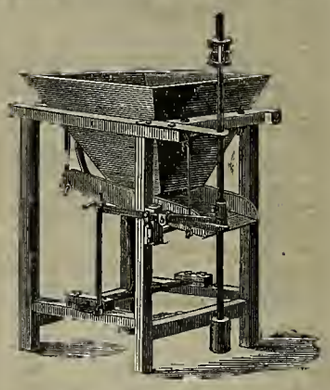
Tulloch's Automatic Ore Feeder.



At the request of Mr. Jas. Tulloch, we have carefully examined his patent Ore Feeder for Quartz Mills, now on exhibition in this city at the Pacific Foundry, and in view of its simplicity of construction, directness of action, durability and compactness, as well as its small weight and the low price at which they are held by the patentee, so as to place them within reach of all mill owners, are free to state our unqualified opinion that we regard it superior to any Ore Feeder of which we have any knowledge in actual work. We are confirmed in this opinion by the severe tests to which it has been put, doing its work thoroughly well on ores of all kinds. We find the delivery to the mortars of the ore-stuff, whether dry, damp or wet, to be entirely uniform and regular, and that even slimes and slush can be worked in them under perfect control.

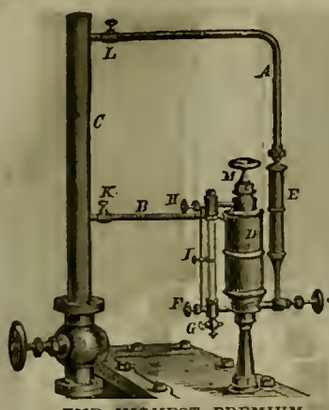
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stoppa; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; werranted t give satisfaction. Patented February 14, 1871. Man ufactured by California Brass Works, 125 First street, S F. — 24v23tf

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing end amalgemating oras, they heve no eqnal. No effort has heen, or will he spared to have them constructed in the most perfect manner and of the great numher now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pen being filled, the motion of the mnller forces the pulp to the center, whera it is drawn down throngh the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thns it is constantly passing a regular flow hetween the grinding surfaces and into the quicksilver, until the ore is redneed to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all othera They hring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-menara invited to examine these pans and setlere for themselves, at the office, 229 Fremont Street, San Francisco

Morris' Settler and Amalgamator.

PATENTED MARCH 25, 1873.

An important improvement in milling. Cheap, light, efficient and durable. Oains Quicksilver on working tailings. Is discharged from the surface in the center instead of the side, by means of a Syphon which extends to near the center of the Settler. Heaviest casting weighs only I35 pounds. The sides and hottom of the Settler are made of wood, as also Mullers, placed vertically—the friction of which brightens the quicksilver.

One of these machines is in daily operation at No. 616 Merchant street, (basement), San Francisco, Parties desiring information as to rights of use, purchase, etc., can address,

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 8, 1874.

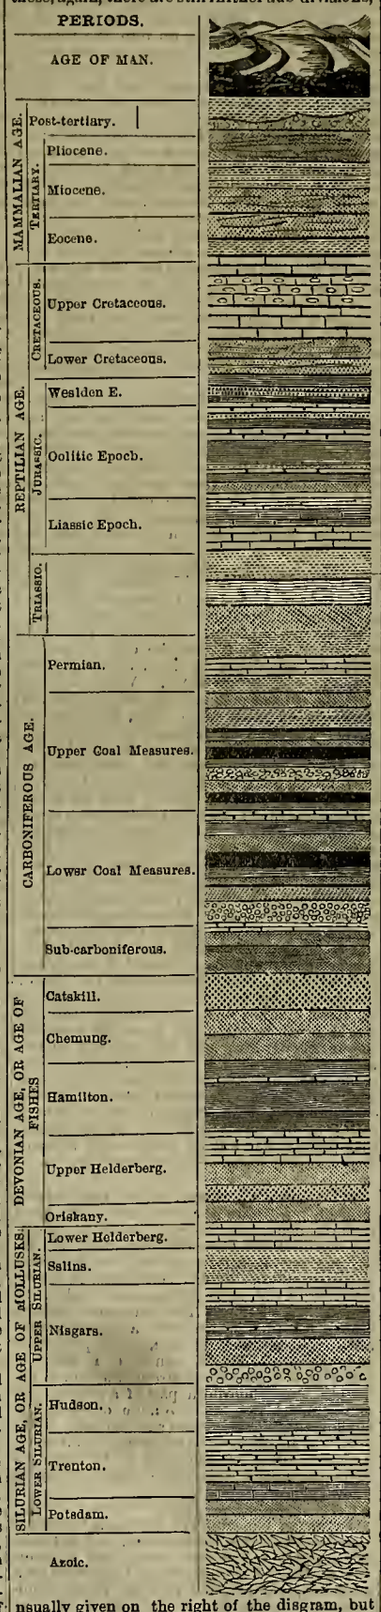
VOLUME XXIX Number 6.

The Earth's Crust—How Made Up.

By the "earth's crust" is meant that small portion of the exterior of our planet which is accessible to human observation. Our research of course, is confined to only such observations as can be made in deep mines, or in valleys which have been excavated by natural means, such as the attrition of icebergs, or the action of water. The object of this present article, and the accompanying diagram, is to give such of our readers as have not ready access to scientific works some idea of what has been learned in this direction. Those who are familiar with the principles of geology will, of course, excuse the elementary facts here given for the benefit of others. The illustration is taken substantially from Dana's Manual of Geology, and gives an ideal vertical section of the earth's crust, as it would appear at some locality where all the various deposits might be found, regularly imposed, without any disturbance from upheavals or erosions. Of course, no such place exists, for evident reasons; but all the deposits shown are found in some one or more places on the earth, and always in the precise relative order as shown. Of what materials the earth is composed, and the manner in which they become so peculiarly and regularly arranged, seems only until quite recently to have formed the subject of special inquiry and study. It has ever been apparent that the solid parts of the earth consist of distinct substances; such as loam, clay, sand, slate, granite, lime, etc.; but, for long ages, and indeed until within a very brief period, it has been supposed that all these various substances came from the hand of the Creator, in substantially the same form as we find them. As soon, however, as scientific men began to turn their attention seriously to the study of the phenomena connected with the surface of the earth, it was found that among the rocks the remains of animals and plants were found in great variety, and always arranged in a certain uniform manner, with regard to their superposition, any particular variety which was found below another in one locality was sure to be found in the same relation in every other. This discovery naturally led to inquiry as to the cause of such uniformity; and the result of these studies has been the building up of the modern science of geology. The diagram not only shows the different deposits in their chronological order, but the comparative thickness, also, of the various beds or layers.

All the remains of animals and plants are found above what are termed the crystalline rocks, such as granite, gneiss, etc. No matter how far we go down into the granite, we nowhere find any remains of life, either animal or vegetable, or any change in the character of the rock structure; hence the whole geological structure, so far as known, is superimposed upon the crystalline rocks, which are called "azoic," a term meaning without life. Starting then, from this point, at the bottom of our diagram, and going upwards, we immediately find evidences of life with the first change in the character of the rocks. In the animal kingdom we here first find the remains of three orders of animals—the *radiates*, the *mollusks*, and *articulates* (as crustaceans and worms)—in the vegetable kingdom we find only the *algæ*, or sea plants. Other kinds of animals and plants appear in succession as we move upward along the diagram, until we finally arrive at the age or period of man, and the most perfect forms in the vegetable kingdom.

It will be observed by looking at the left hand side of the diagram that the entire time in which life has existed upon the earth is divided into six great periods or ages—the age of mollusks, the age of fishes, the carboniferous age, the age of reptiles, the mammalian age and the age of man, or mind. The first grand division is sub-divided, for the convenience of scientists, into two—the upper and lower silurian; the fourth grand division—the age of reptiles—is separated into three sub-divisions—the triassic, jurassic and the cretaceous; the mammalian age is also sub-divided into tertiary and post-tertiary. In addition to the sub-divisions already mentioned, there are a great number of other sub-divisions, as given in the column next adjoining the diagram. In addition to these, again, there are still further sub divisions,



usually given on the right of the disgram, but which we have omitted altogether from our diagram, as they would here only serve to confuse the reader.

The azoic rocks—granite, gneiss, etc., rocks in which no remains of life are found—constitute the only formation which is continuous, at a certain depth, all over the earth. They form the floor of all other deposits, and were the first rocks which emerged from the primeval ocean, which no doubt at one time enveloped the entire earth. As sections of these rocks were pushed up, the air, rains and moving waters commenced wearing them away, and re-depositing them in still water. From this source we have the earliest stratified sand or mud, which subsequently hardened into rock, and formed the various layers of the lower silurian rocks. They in their turn were again worn away, mixed with more debris from the underlying granite and again deposited, forming at certain points certain other deposits or layers. It has been by such and similar action of wearing away and re-depositing, that one layer after another has been created and deposited as we now find them, through the four or five miles' thickness of what we know of the crust of the earth. In some places the original granite still appears. In others it is buried to depths greater or less, as the elements, upheavals, depressions, etc., have been more or less active in their operation. This system of arrangement in the earth's features is every way as marked as that of any of the species of animal or vegetable organisms. It might be interesting in this connection to mention that the portion of the earth which is supposed to have been the first to have been lifted from the primeval ocean, was that to the north of the St. Lawrence river, extending north-eastwardly from Lake Superior to the Atlantic ocean, and north-westerly from the same point to the Arctic ocean.

The three first great divisions as shown are more perfectly represented in America than any other part of the world. Hence the reader will find the names of American localities generally applied to their more minute sub-divisions, as given in the diagram. The later formations, including the reptilian age, are better represented in Europe than in America, as is seen by the European terms more generally given to the subdivisions—not however given in our diagram.

As already intimated, it should be borne in mind that there is no one place on the globe where all these formations are perfectly represented. In many portions of the world only one or more of the geological divisions are represented. This is explained by the fact that such portions of the earth's crust were first elevated above the ocean bed during the epoch to which the division is assigned. Consequently none of the earlier stratified beds could be found there—they could not have been formed beneath the ocean. We will give in a future issue a diagram showing the progress of life—animal and vegetable—from the silurian age to the present time, which forms the basis of the subdivision of the earth's crust as herewith shown, into geological ages.

THE CALISTOGA SILVER MINE.—We understand that the machinery for this mine is now on the ground, and will be erected and put in operation within thirty days. The mine is well opened, and is said to have many months' supply of rock in sight. The probable cost of milling and mining will be about $10 per ton. The rock is a gold and silver-bearing ore, similar in its characteristics to that of the Chollar mine on the Comstock lode, and quite unlike anything hitherto found in California. We are assured by an expert who has recently visited the mine that, although but little credence should be given to the many exaggerated reports that have been circulated with regard to the richness of this mine, founded upon exceptional assays, the mine bids fair to yield a remunerative profit to its promoters. The bullion assays $12 of silver to $20 of gold.

THE SUTRO TUNNEL.—On Tuesday of last week the main header of the Sutro tunnel was in a distance of 6,356 feet; progress for the week, 60 feet.

NEW HOISTING MACHINERY.—The new hoisting machinery at the Crown Point mine was started last Saturday morning, and the company are now shipping ore as usual.

From the Quicksilver Mines.

Much activity is reported among the quicksilver miners to the north of the Bay. The discovery of new indications is reported at the upper end of Pope valley, Napa county. The quicksilver is found in the surface dirt, and is obtained by simply panning—a large amount of the pure article being obtained from every panful. Colusa county is also putting in her claim as a quicksilver yielding district. The Colusa *Sun* of Saturday last says: Both the Buckeye and the Elgin continue to take out quicksilver with their retorts. The latter sent down eight flasks last week. The castings for the furnace of the Abbott mine have all been made, and most of them will be at the Colusa wharf by the time the *Sun* goes to press. The brick will be ready for delivery by the 10th of the month, and by the 10th of September, the furnace will be ready to turn out from five hundred to a thousand pounds of quicksilver a day.

The Lake County *Bee*, of July 30th, says: There are 150 men, mostly Chinamen, now employed at the sulphur banks by the California Borax company, mining for quicksilver. The new reduction works are nearly completed, being situated on the site of the old sulphur works of this company. A large force of men are making bricks out of the soil which contains the quicksilver, which are hereafter to be burned for the extraction of the metal. Superintendent H. L. Lightner contemplates shortly increasing his force of men to 200.

The new furnace of the Great Western mine, Lake county—the Luckhardt furnace—with a capacity of thirty tons, started on Saturday last. They are also constantly running their 10-ton furnace, the product of which last week was 27 flasks. We are credibly informed that this company is reported to have a large supply of ore in sight, and may reasonably expect a product of from 400 to 500 flasks per month.

The St. John quicksilver mine, near Vallejo, is now producing from 150 to 200 flasks per month. This mine is quite exceptional in its character from such mines generally. It presents well-defined walls, with "slickensides," in connection with the hanging wall. The gangue is found in serpentine, in connection with metamorphic sandstone and clean quartz. This company has opened its ground by a well-arranged system of tunnels and cuts, seventeen in number. The greatest depth reached is 200 feet.

LIGHTING GAS BY ELECTRICITY—A HINT TO INVENTORS.—Most of our readers are familiar with the term "electrophorus"—a term denoting any instrument for exciting electricity in small quantities. The point we wish to make is the application of some device of this kind which may be attached to an ordinary gas-burner, so that when the gas is turned on, the instrument may generate an electrical discharge of sufficient intensity to light the gas without the inconvenient and offensive necessity of employing a lucifer match, or some equally inconvenient device. The instrument might be operated by the simple act of turning on the gas, or it might be made to act the part of a stop-cock to turn it off, and an electrophorus to light the gas when removed. Something of this kind was exhibited before the British Society of Arts some ten years ago; but we do not learn that it was either patented or introduced into use, although the Society's journal stated, at the time, that it was simple, cheap and effective. It was not fully described, but appeared to have consisted of some form of a stopper of vulcanite, the friction of the removal of which, from an ordinary burner, generated an electric discharge which ignited the gas. If some person should turn his inventive genius in this direction, there is a possibility that the public might be placed in the possession of an important desideratum, and the inventor on the high road to fame and fortune.

NEW MINES REPORTED ON THE NORTH FEATHER RIVER.—Considerable excitement exists in the northeastern portion of Tehama county, over the report of the discovery of new and extensive mines somewhere on the head branches of North Feather river.

Cherry Creek.

The editor of the White Pine *News* is examining the mining districts of his part of ths country, snd he givss the following about some of ths mines in Cherry Crsek district:

The third dey of our visit wss devoted to looking at the property known as the Cherry Creek mill and mining compauy, embracing locations called the Tea-cnp and Gsneva, respectively. The minerel helt whereon these mines are found is the same as that described in a former lettsr ss cheracterizing the Chances mine, and a careful survey reveals an extension of the same chsracter of walls, both hsnging snd foot, as fonnd at the locality mentioned. More work has besn done on ths Tea-cup mine thsn on any otber in the district, the result of which has been to raise large qnantities of good pay ore from a sheft or incline now nearly 135 feet in depth. In the temporary absence of supsrintendeut Stanford, we were shown around both above and below ground, by Mr. Kimball, who is interested largely in the property himself. We were indeed surprised at the large amonnt of really rich rock in view, and must confess onr admiration of the prospect, now reduced to a certainty. The ore is of a free-milling character, and can be treated with perfect ease and facility, withont roasting, and can be obtsined, jndging from present appearances, in almost inexhanstible quantities. The company have no mill of their own, and will probably not ercct one nntil having pnt through a quantity of rock now on hand. A large force of men are constantly employed, and ore is being shipped daily to the mill to await reduction at some future time. The continuity and unbroken cheracter of the ore channel on which are located tbe mines we have attempted to describe, associeted with the fact of sucb perfect geological development of the country eround, lead one to the conclusion that Cherry Creek district must eventually be the leading mining section of eastern Nevada. In the words of a gentleman whom we met there, "if there are no mines here, I shall leave the bnsiness which has been my pnrsuit for twenty years, and commence psddling pea-nuts or hot corn." We find this the general expression of confidence in the permanency of the district.

E. B. Diokenson, superintendent of the Midas and Steptoe Consolidated Co., accompanied us from the Teacup to his location, situated a short distance, in fact, adjoining the last named on the south. Here again was presented to our view the prodigality with whioh nature had scattered boulders of pay ore on the surface. We are informed that from 50 to 200 tons of good rock will be sacked and sent to mill from the croppings over the Midas mine. Work has been commenced here by means of a tnnnel driveu into the western slope of the monntain, and already 100 feet has been attained, where a crosa drift will he run to strike the ledge. Every indication proves to us the existence of a fine ore-hearing vein, which all heartily wish may be permanent. The superintendent informs us that he is working now only a small force of men, but will soon extend his operations very materially. We are impressed with the confidence expressed by all in the future of the whole country, by precticel and interested miners who have faith enough in their belongings to stick to them through thick and thin, nntil they oan be developed hy aid of capital. Beside the mines described in tbese letters, we were shown several other locations which we had not the time to visit. In our next we shall give an account of the Gray Eagle aud Star mines.

Miner's Luck—Nevada.

About Randolph Hill, a short distance from Grase Valley in the direction of Rough and Ready, were once very rich surface diggings. Years ago A. W. Ress worked his diggings up toward the hill until stopped by a cabin just ahead, the owner of whioh protssted against being undermined. The clean-ups did not justify the payment of damages, and so the claim was abandoned. A year and a half or two years ago, the cahin having heen long abandoned and fallen to ruin, and miners being content with less wages than in flush times, Rees and a partner went to work in the old claim and for a long time were rewerded with very indiffsrent success. The clean-nps only paid grub bills and the pertner often threatened to throw up the cleim. One clean-up day the pan showed only six bits as a return for many hard knocks, and at noon the partner began packing his blankets. Rees qnietly remarked that as they would have to pay for a whole day's water they had better work the day ont and perhaps their luck would turn. They did work tbe day out and luck did favor them. That night they had nineteen onnces to divide; and since that the claim which so narrowly escaped degradation by abandonment has cleared the fortunate owners many thousands of dollars. They had struck a decomposed quartz ledge and have from that day to very recently worked it with great profit. One pan taken from a pocket turned out over $1,800 in gold, and $50 a day has been no nnusual average yield. The claim has been quietly worked, by hand pump and hoisting, to a depth of 80 feet; and wonld he turning out now bnt for an accident to the ditch, which flooded the works and necessitated some dead work, now being done. How meny jnst as good mines exist with six miles of the center of Grass Valley? Who knows? It might pay some hundreds of able bodied men to pitch in and find out a few of them.—*Foothill Tidings.*

Fire in the Belcher.

The Gold Hill *News* of ths 30th ult. says: At about sight o'clock lsst night the town wes startled by the report that the Belcher mins wss on fire, and in lss than five minntes from the time the report was received, although no bells wsre rung or whistlss blown, the streets were deserted; and men, women and children, to the number of about a thousand, were hnrrying to the mine. Arriving thsre, their fears were shortly after qnieted, by the announcsment that the fire had been extinguished, and by seeing the miners descending to their work. The fire originated on the 1,300-foot level of the Crown Point, near the line of the Belcher, whsre some minsrs were blasting decayed timbers from an old drift.

The Miners Alarmed.

The timbers were inflammable, and took fire; but, by the prompt action of those who perceived it, the fire wss extinguished hy the aid of a Babcock fire-extinguisher, kept on the level; but not soon enough to prevent the miners smelling the bnrning wood, and stempeding like a flock of frightened sheep. The word passed from drift to drift, and from level to level, like wild-fire, that the mine was on fire, and a rush was made for the shaft, and the giraffe was kept moving at a lively rate until the excitement snbsided. A few of the old hands took matters coolly and remained below, but they were the grand exception. In speaking to the engineer this morning, we ascertained that all those desirous to get ont reached the surface within fifteen minutes after the alarm was first given, so that in case a first-class fire had occurred no lives would have been lost.

Incidents in the Mine.

When the alarm reaohed the 400-foot level, a yonng man, about 20 years of age, a new hand, threw his pick to one side, and with a yell that would have done credit to a Sioux Indian made for the shaft, and waited for the giraffe to put in an appearance. He had not long to wait. As soon as he got on he plumped down on his knees, and like an honest miner, lifted his hands and voice in prayer for the salvation of hie wicked soul.

Two miners on the 1,200-foot level had an altercation jnst before the alarm was given, and agreed to settle it upon reaching the surface at 11 o'clock, but while waiting for the giraffe dnring the excitement, the quarrel was renewed, and one of them, a Cornishman, stabbed the other nnder the arm with the sharp end of his candle-holder. The wound inflicted was about an inch aud a helf deep, but not dangerous. Dr. Kirby dressed it last evening.

Banner District Mines.

A corrresponden of the San Diego *Union* thns writes concerning the mines of the Banner district:

Prominent among the mines of this district is the Chariot Mill mine, owned by a San Francisco corporation and managed by F. L. Perkins, an old and experienced mining superintendent of Amador and El Dorado counties. The company's new hoisting works and 10-stamp mill are both running in perfect ordsr. The amalgemation of the ore is perfected end the entire mining and milling is second to none. Enough has been said before concerning this mine, so I will proceed to the Ready Relief mine, owned by Messrs, Neyhart & Schuyler, who have just purchesed it from Bailey Brothers & Co., for the snm of $45,000. Admirably located, it can be worked hy tunnels to the depth of 600 feet on the inclination of the ledge, and at less expense than any other mine in the district. The pay chimney or the chute promises to be a long one, and as the ore has been yielding an average of $50 per ton, the vein averaging eight feet in thickness, it is no hard mathematical calculation to prove to the disposers of the property that they made a bad speculation in selling a twenty-dollar piece for one. Rnmor has it that the fortunate pnrchassrs are going to work the mine as a mine ehould he worked, by shortly erecting a 20-stamp mill and opening ont at a lower depth the immense chimney of ore exposed in the upper levels; without doing this the new mill could be kept running three years on ore sunk and drifted through. Apparently on the seme ledge lying northerly from the Ready Relief miue is the Hidden Treasnre miue, owned by Messrs. Ross & Putney. The last month these gentlemen have teken out $700 worth of ore with tbeir own labor, besides $300 in specimens, which they crushed in hand-mortar.

The Young mine, sonth of the Chariot, will make a mine. The Golden Rule is a first-class location, and will nndonbtedly yield handsomely for working. Tbe Poorman, lately purchased by F. L. Perkins, snperintendent of the Chariot Mill mine, although not opened to any great depth, promises to be one of tbe hest mines in the district. Among the other mines I have visited are the Cable, Kentuck, Madder, Beaver, Empire, Hubbard, Redmoud, and many others, each one a fortune for several if properly worked and manged.

From Robinson.—We are informed by private letter that the mines bonded to the Watson company, and sitnate in Nevada district, named respectively the Sumner and Portland, are looking extremely well. Superintendent T. D. Elmore sends us, as the resnlt of three assays, $1,112, $1,240 and $1,144, all of which we regard as highly satiefactory. The furnace being erected by tbe Canton company is rapidly approaching completion, and will be started on tbe first proximo.—*White Pine News.*

Eberhardt and Aurora Mine.

Our visit last week was of such a hnrried neture that it was impossible for ns to give more than a pssing description of the appearance of the justly cslsbrated mines of the company whose name heads this itsm. On Mondey last, while ths minsrs were busily engaged at ths polls, we accepted an invitation from foreman William Maxwell to explore the depths undergrond. Passing in through the South Aurora tnnnsl, which commences on the eaat side of ths hill, we were couducted along a distance of some 750 fest to ths opening lately made into the Wyon chamber.

We heve attsmpted heretofore an imperfect sccount of the wondsrful body of ore coutained within the walls of this new discovery, snd are even now at a loss how to commence anything approaching a competent description of the seme. The level on which we first entered the immense excavation is abont 150 feet from the snrfece, and since onr lest visit a shsft hss been sunk down a distance of 60 fest, at which depth another huge body of ore has been enconntered, soon to be connected with the upper workings, making a chamber of almost solid mineral, measuring, approximately, from 90 to 100 feet in hight and of as yet unknown length. Some specimens taken by ns from the walls are exceedingly rich, going up into the thousands, and the general average, we are told, will be from $80 to $120 per ton. Some fifty tons are being daily extracted from tbis wonderful enhterranean cavern, and the quantity remaining in sight seems to be increasing instead of diminishing. The foot wall, which is found from the South Anrora on the south to tbe Hidden Treasure on the north, is here enconntered, bearing the same dip and in perfect line from end to end. All ore fonnd lies east of this north and south foot wall, approaching nearly if not quite up to the wall, and exploration has proven that no mineral is found beyond or west of the same. This fact only still further proves the truth of the theory advanced and maintained by us during the years in which we have been acquainted with tbis truly remarkable locality, and is convincing as to the existence of a true vein of mineral extending completely through the hill, rich in quality and enormous in quantity.

It is with much satisfaction that we commence to see the light, for which we have all so long waited and prayed, breaking out from the darkness and despondency of the preceding years, and tbe general feeling of confidence expressed is but a natural result of the illustration of a firm helief in the certein foture of our country. A drift running north, east of the Wyon chamber, and on tbe line with its present workings, leads directly to the central shaft, and is now hut 20 ft. from its destination. Tbis shaft will he an avenue through which the ores mined will he raised to the surface by means of a steam hoisting engine, now being put in position. The depth from the surface will be 205 ft., and the ore will he delivered at that depth hy means of oars, run from the various workiugs. While in the mine the shift of men at work had charged the varions holes reedy for a blast, and were removing the timbers preperatory to shooting them off. At a given signal, the men having retired to a safe distance, the match was applied, and shortly the earth moved and swayed with the concussion, resulting from the thundering tones of 21 shots, following each other in rapid snccession. At this time wes demonstrated another beauty of our Treasure Hill mines. The powder smoke, which sometimes lingers for a long time underground, here is borne off rapidly through the various shafts and tnnnels rnnning to the surface, thus causing bnt little delay to miners from this canse.

It is generally supposed that the old workings, such as the Risdale, Ledies', Peerless and Earl chembers, situated south from the Wyon, have been completely worked out. But this is an error, and we were convinced of this by Mr. Maxwell pointing out to us the immense amount of pay ore still left clinging to the walls on every side, but which, being of low grade, snch as $40 or $50 ore, bas not been distnrbed. When manager F. Drake has succeeded in getting his company ont of debt, a matter of hnt short time now, he informs ns that prospecting will he commenced with energy and persistence.—*White Pine News.*

A Dangerous Present.—Very few people, probably, are aware that osminm is the most powerfnl poison ever known. At a recent meeting of the Paris Scientific Academy, M. H. Sainte Claire Deville, a member of this learned assembly, offered to his colleegnes, in a perfectly tight vial, eight killogrammes—about 15 pounds—of osmium. The illustrious chemist accompauied his present with a short explanation. Osmium, he said, is the most poisonons of all poisons. Twenty ponnds of it would he sufficient to poison the entire population of the world. One thousandth part of a grain of osmic acid, set free in a volume of air of 100 cubio yards, wonld possess snch a deadly influence that all the persons respiring the air could be nearly killed. Osmic acid is so much the more dangerous that no counter poison is known against it.

Smelting Works.—The Mattison furnace is rapidly approaching completion, and will soon be reany for active operations. Mr. Prescott will at once gst his force ready to start up on a good snpply of ore, and from all present indications, a success will be the result. It is intended to make a trial of the furnace on the 1st proximo.—*White Pine News.*

Ores of Lead.

E. J. Halleck writss ss follows in the *Iron Age*: Lead ores ars found abundantly in all parts of the world, and not being difficult to work, we may suppose that lead was nsed at a very early date.

In nature lead occnrsin many different forms; its compound with sulphnr, known ss galena, is, however, the one generslly employed for obteining the metal. It contains, when pnre, 86.6 per cent. of lead, the remaining 13.4 per cent. being snlphnr. It is easily recognized by its gray color, metallic lustar, and cubical crystals. Its specific gravity is about ths same es iron, 7.2 to 7.7; and, with the exception of cinnabar, it is the hssviest of the ordinary minerals. In hardness it resembles rock salt, is scratched by a copper coin, but not scrstohed by the nsil. Gelena always contains more or less silver, the amount varying from 0.02 to three per cent.; the quantity must be determined by cupellstion, no external characters serving to distinguish the kinds that contain much, from those which contain bnt little. Galena is soluble in nitric acid, fuses on charcoal before the blow-pipe, emitting snlphnrous fnmes and yielding a globule of metallic lead.

Clausthalite is a compound of leed with selenium, similar to the above, but much rarer, being fonnd only in the Hartz, and in Saxony, Germany and a few places in Spain and Sonth America. Cerussite, or native carbonate of lead, is a valnable ore fonnd in Massachnsetts, Pennsylvania, Virginia and many Northwestern States. It contains about 77.5 per cent. metallio leed, and has a white, gray, or grayish-black color, with an adamantine luster inclining to resinous and sometimes pearly. The remaining ores of lead possess little valne in the arts. Some, however, are remarkable for beanty of colors and crystalliue form. Crocoite, or native chromate of lead, has a bright hyaointh red color, with adamantine, vitreous luster; is always found in prismatic crystals, which are very hrittle. It is easily dissolved in acids, and in hydrochloric acid gives a green solntion and crystallized needles of chloride of lead. With a salt of phosphorus it gives an emerald green bead in both flames of the blow-pipe. Anglesite is a native sulphate of lead having a white color, and is found either in prismatic crystals or lamellar masses. Pyromorphite, or native phosphate of lead, occurs in beautifully colored green, yellow and brown crystals, in the Perkiomen lead mine, near Philadelphia, and at Phœnixville; also in New York, a mile south of Sing Sing; in Davison county, N. C., and a few other localities. Lead is also found in combination with oxygen as minimum, with arsenio acid as mimetite, with tnngstic acid as stohzite, and with molybdic acid as wnlfenite.

Table Mountain Mines.

The Tuolumne *Independent* says: The Alpha gravel mine, nnder Table mountain, is now yielding good pay. Our informant states that last week he saw a smooth-washed bonlder, about the size of a man's head, taken out of the face of the drift they were working; this was covered with cement, which, when scraped off, filled half a pan, from which was obtained $25. On Thursday, of last week, he saw two-thirds of a pan taken ont of this level, which paid $20—one piece worth $7. They are now working 10 men nnderground. The gang who were running from present channel, over high ledge, have struck a back channel. This still further confirms the assertion of old Table mountain miners that there are two distinct river beds channels nnder the monntain. The one on the east side is the most ancient, and is known as the Caldwell or Saratoga channel, and carries heavy, black, coarse gold, wherever it has been struck in Table mountain. The west channel is of later formation and carries finer and brighter gold; no black gold is fonnd in this, and no pipe clay, as is the case in the other. As intimsted above, all old miners are positive there are two distinct channels, and that both have been found at the head of the mountain, at the Buckeye, and also at the Hnmbug or Blue Gravel claims, several miles apart, would seem to prove the fact. After getting on the slate ledge, in this Caldwell or Saratoga channel, a hnndred feet ie all a party needs to seonre a fortune. as it has always proved immsnsely rich. In this channel, at tbe head of the monntain, the Caldwell claim paid, in a rnn of common sluices, 14 pounds per day. Hnndreds of jnst snoh claime still lie nntouched under Table mountain. All that is necessary is capital to extend the old tnnnels, and go after the rich deposite. These were abandoned by poor men in early days who were unable to continue the work. Some of these tnnnels are probably within a few feet of the ancient channels, and will yet prove how near these poor fellows were to the fortunes they labored so long to find, but at last left for others to reap, after most of the hard work had heen done by them in a vain effort to reach their reward.

Sprucemont.—The White Pine *News* has noticed sevsral large teams, laden with fireproof rock, coming from the Pancake range and on their way to the above-named locality. A letter from Mr. Linehan, assayer and smelter in the employ of the Star King Mining Co., at Spruosmont, informs the *News* that his company is about to inaugnrate work on an extensive scale. Opportnnities will shortly be presented to practical smelters, miners and laboring men, to obtain employment at this point; in fact, onr informant states that he is in need of good men at this time.

MECHANICAL PROGRESS.

Straw-burning Engine.

There was exhibited at Vienna during the Exposition last year a straw-burning engine which attracted much attention. An exchange, in speaking of it, says: This engine is one of the novelties of the exhibition. A 10-horse power engine was used for the experiment, making 140 revolutions per minute, and the brake was loaded for duty of 19 horse power; 355 lbs. of straw was carefully weighed, consisting partly of bright rye and partly of loose, broken wheat straw, purposely mixed in order to test the capabilities of the engine for burning all kinds of fuel of this description. It required 46 minutes to consume the straw, steam being kept up during the whole time at a pressure of 70 lbs. per square inch with the greatest regularity. This result gives a consumption of about 24.5 lbs. of straw per horse power per hour, and as an engine burning average coal under similar circumstances would have required about 6.4 lbs. per horse power per hour, it appears that rather less than 4 lbs. of straw are equal to 1 lb. of coal. In threshing, about nine sheaves of straw are required to thresh 100 sheaves of wheat or barley. Everybody present was highly satisfied with the results of the experiment, as it has long been the desire the Eastern farmer to find some means of using steam power without incurring the enormous expense of bringing coal and wood from a long distance. This invention completes another link in the history of the steam engine, and will enable every farmer who raises more straw than he requires for the use of his estate, and who is miles from a coal mine or forest, to use steam instead of animal power, and at far less cost than hitherto. To California farmers, however, this engine will not be so great a novelty.

THE SZAROCH, A NEW RUSSIAN PROJECTILE. A new shell, under the above name, has just been adopted by the Russian artillery, which seems to have certain advantages. When the old spherical shell was replaced by the elongated shell, now entirely in use, the argument was the necessity of obtaining a higher initial velocity, which was possible only with rifled guns. There was not an artillery man who did not regret the sacrifice then made of the ricochet shot; a shot extremely useful in certain cases, and apparently quite impossible with an elongated projectile. Some two years ago a Russian officer devised a shell which was a time or percussion shell and at the same time could give the result of a ricochet shot. The szaroch, as it is called, is an elongated shell, the head of which is completely spherical; a round shell upon the end of an iron cylinder. The two parts are united together by a comparatively slight thickness of metal. When fired, the szaroch leaves the gun like an ordinary shell; but when it bursts, the cylindrical part alone flies in pieces, while the spherical head continues its flight intact and may ricochet for hundreds of yards further. The advantage of such a shell against artillery, for example, is very great. After bursting and scattering its fragments among the guns of the enemy, the head goes on to plunge into the infantry still further back. It is only to be used in Russia, however, for cannon of moderate size.

NEW FRENCH RIFLE.—A gunmaker of Limoges has submitted to the military commission at Vincennes a rifle of very novel construction. It is thus described in a Paris journal: The new gun presents nothing remarkable externally, but the lock is so arranged that the breech is opened by cocking the piece, and the charge being introduced, the breech is closed and the gun fired by touching the trigger. The cartridge consists of a hollow, leaden cone filled with powder, and closed at the base by means of a piece of cork. At the moment the cartridge is introduced into the breech the powder escapes by a small hole in the cork, and an imperceptible bell of fulminating powder, which forms the priming, takes its proper position. The triple action of cocking, loading and firing is thus effected simultaneously, so that a man with very little experience can fire twenty rounds a minute. The cartridges are stored in an iron tube, which is placed parallel with the barrel, and contains 30 balls, so that the piece may be fired as many times almost without any interval, and without removing the stock from the shoulder, as there is nothing to be done but to cock and pull the trigger.

DANGER SIGNAL.—MM. Lartique and Laforest have recently invented a novel device, intended as a danger signal, which is now in successful use on some of the French railroads. A whistle is arranged on the locomotive so that it will, when once opened, continue sounding until shut by the engineer. The same device which turns the disc signal, so as to show the danger side, is intended to transmit a current of electricity to a little projection between the rails. When the engine passes over this spot, a metallic brush hanging between the wheels strikes on the projection and sweeps over it, at the same time transmitting the current to an electro-magnet which pulls the whistle open. The latter, by continuously sounding, warns the engineer.

A NOVEL watch has been invented by a Swiss watchmaker of Aargau. The motive power is compressed air.

The Sand Blast.

Some new and interesting applications of this invention were lately described at a meeting of the students of the Polytechnic college, Philadelphia. Samples of raised lettering on marble, also of ground uncolored and of stained glass ornamented by the process were exhibited. Samples of thick plate glass, perforated by the sand blast with well defined holes one-fourth inch in diameter, were shown. The holes for the axles of the glass plates of electrical machines can be safely cut in this way. The lettering of the block of marble had been done by first grinding and polishing one of its surfaces, attaching the stencils (letters of the size and shape required cut out of plate metal), and then blowing sand, by means of a jet of steam, on the surface, until, where unprotected by the stencils, it is cut away to the required depth, leaving the letters in bold relief. The stone to be cut is placed upon a small truck, and then moved backward and forward upon a horizontal table, directly under the nozzle through which the sand is blown. The nozzle, which stands vertically over the table, has the pipe for the sand, entering the upper end, passing in the line of its axis, towards its lower opening. The steam enters through the side of the nozzle near its upper end, so that, when in operation, steam surrounds the tube through which the sand runs. A rubber pipe conveys the sand from an elevated box to the tubs.

TESTING STEAM GAUGES.—That will be an expensive gauge which government is to have in one of the towers of the Smithsonian Institute, with its costly column of mercury one inch in diameter and 150 feet in hight. It is to be the standard gauge whereby all manufacturers of steam pressure-gauges, and all supervising inspectors, may test the correctness of the instruments which they make or use. By means of this apparatus any gauge may be subjected to a mercurial pressure of 800 pounds to the square inch, and as it is to be constructed without regard to cost, it will be as nearly accurate in its graduations as human skill can make it. But as it cannot be expected that every gauge hereafter manufactured or now in use can be sent to the Smithsonian Institute, for the purpose of being tested, there will have to be many other standard gauges—*fac similes* of the Government one—erected in different localities, so as to leave no excuse for neglect or doubt; and when these standard gauges have become readily accessible, those who are found running their steam machinery with incorrect gauges should be severely dealt with.—*Technologist.*

PREVENTING RAILWAY ACCIDENTS.—An English inventor, Mr. C. Jordan, proposes to make the main lines without the usual switches, turnouts and crossings, being continuous from end to end, and to work such road by transferring trains where necessary from the main line to the adjacent siding, by lifting bodily from one line to the other. The lifting will only be an inch or two, and the hydraulic apparatus as now constructed will make nothing of the weight; while, as to time, Mr. Jordan calculates that a few minutes will suffice to transfer a train from one road to another without disturbing a passenger. The whole work, as regards the hydraulic apparatus, may be done by one or two lads.

PIPE JOINTS.—Mr. J. Phillips, of Hammersmith, has received a patent for a new method of making tight joints for pipes. The joint is of the spigot and faucet kind, the spigot and faucet being made with tapering parts fitting or nearly fitting each other at the front and back of the joint, with an annular cavity between the fitting parts, which cavity is filled with cement of fused material introduced through apertures in the periphery of the faucet. To prevent escape of the fillings in, rings of yarn or other yielding materials may be placed in annular grooves in the tapering parts of the spigot and faucet.

THE LARGEST LOCOMOTIVE IN THE WORLD. It is stated that the largest locomotive in the world is the "Pennsylvania," on the Philadelphia and Reading railroad. The principal dimensions of this engine are as follows: Diameter of cylinders, 20 inches; length of stroke, 26 inches; number of driving wheels, 12; diameter of drivers, 4 feet; and the weight of the engine alone is 60 tons.

STEAM on our canals seems to be an accomplished fact. Six boats are now plying on the Erie canal and twelve others will shortly be added, all capable of making the trip from New York to Buffalo in five days. It is believed that the grain trade of the fall will be considerably affected by the increased cheapness of transportation.—*Scientific American.*

THROUGH MANY HANDS.—In viewing that tiny bit of steel called a needle, it is hard to realize that seventy pairs of hands are required to make it perfect. Seventy pairs of hands to make a needle! and each pair necessary to make the needle perfect.

THE deepest boring that has ever been made for coal was made in 1853-7, at Mouille-longe, where the drills reached a depth of 1,006¼ yards, when the tools broke at the bottom of the hole, and the work had to be abandoned.

COLORED LENSES FOR LAMPS.—A recent English patent covers the invention of coating white glass lenses with a film of colored glass instead of making them of colored glass throughout.

SCIENTIFIC PROGRESS.

Geology of the West.

Among the geological deductions of the Wheeler expedition are the following: All that portion of the United States west of the plains is characterized by corrugation, that is, the geological formations once horizontal have been bent and broken and thrown into ridges so as to produce a mountainous country. The ridges vary greatly as to hight and length, but agree in a general northerly trend; so that in traveling north and south it is generally easy to follow valleys, while in going east or west one is confronted by range after range that he must climb or go around. In the lower parts of this great mountain system, the slow but indefatigable agencies of rain and stream have accumulated so great an amount of detritus that the valleys are clogged and the mountains nearly or quite buried. In this way have been produced the great desert plains of Utah, Arizona and Southern California, vast seas of sand and saline clay, from the surfaces of which a few half sunken peaks jut forth as islands. These intermissions of the mountainous character are mere concealments, not interruptions, of the corrugated structure; but that structure is interrupted in one place—perhaps in others, but in one notably—by a tract in which the strata are almost undisturbed. The general surface of this exceptional region lies from 6,000 to 8,000 feet above the ocean, and it is intersected by the celebrated cañons of the Colorado and its tributaries. By these gorges and by other modifications, chiefly dependent on erosion, it is divided into a great number of plateaus which the surveys now in progress are defining and naming. The geologists of the expeditions have found it convenient to designate the region, considered as a geological province, as the region of the plateaus, or the Colorado plateau system. It is surrounded on all sides by areas of corrugation, the ranges at the east constituting the Rocky Mountain system proper, and those at the west having been designated as the Cordilleras. At the north and south, these mountain areas coalesce.

LUMINOUS SIGNAL.—M. Laussedat proposes, for the above purpose, to direct a spy glass from one station toward a second point, to which the signal is to be transmitted. In the focus of the instrument, he places a diaphragm having a very small aperture; so that, on looking through, the field of vision will be restricted to the tower, steeple or other locality at which the receiver of the signal is stationed. The eye piece of the telescope is then removed, leaving the diaphragm, and behind the latter is placed, in the axis of the instrument, a light, the conjugate image of which, produced by the conveying glass, falls precisely on the opening of the diaphragm. The luminous ray transmitted through the telescope will fall directly on the edifice comprised on the restricted field of vision, and not elsewhere, and the light is therefore invisible to all without that field. The observer will perceive the objective of the telescope illuminated over all its surface; and necessarily the larger the diameter of the glass, the farther will the signal be visible.

SIEMENS' method of converting iron into steel consists in melting wrought-iron in a bath of liquid pig-iron, the whole being made into steel by means of very high temperature and the non-oxidizing flame of the regenerative gas furnace. The decarburized iron is thrown in measured quantities at regular intervals into the bath of pig-iron, the operation being completed by an addition of pig-iron which contains manganese in known proportion.

NEW METHOD FOR PRESERVING MEAT.—According to Endeman, meat cut in slices and placed in a room, the air of which is heated to 140°, and only allowed to enter and escape through cotton filterers, becomes so dry in three hours that it can be ground, and, since the albumen and fibrin are not coagulated, it loses none of its nutritive properties.

MILK sugar can be prepared by coagulating the casein, and removing that along with the fat, and then evaporating the whey to crystallization, and purifying by filteration through animal charcoal. It is manufactured principally in Switzerland, and comes into market crystallized on strings, when it somewhat resembles an ear of corn.

BLACK PHOSPHORUS.—The essential feature of this body, says M. Blondlot, is that in a state of fusion it does not differ from normal phosphorus. At the moment of solidification, however, it suddenly becomes black. On refusing, it again turns white, and so indefinitely.

STRENGTH OF IRON PLATES. — From experiments upon the strength of plates to resist rupture from pressure from a blunt body, it has been shown that a wrought iron plate of only a quarter of an inch in thickness is able to resist a force or pressure equal to that required to rupture a three-inch plank.

NEYRENEUF has ascertained by experiments that negative electricity attracts flame, which positive electricity repels.

Circular Compass.

Mention has already been made, in this journal, of the new circular compass invented by M. Duchemin. We now receive further particulars concerning the nature and merits of the invention, as reported by our esteemed exchange, the *Journal of the Franklin Institute:* The magnetic force resides, not in a bar or needle, as in the ordinary instrument, but in a flat steel ring, magnetized, with its poles at two opposite extremities of the same diameter. This ring, supported upon an aluminum traverse, pivoted on agate at its center, has attached to it the ordinary compass card, and acts promptly and efficiently. The author claims for it the following advantages: (1) a magnetic power double that of the needle whose length is that of the diameter of the ring; (2) two central points instead of one, as in the needle; whence it happens that none of the magnetism escapes, and that strong sparks, like those from the Holtz machine, do not derange the poles; (3) a better and more prompt performance of the compass, the cards seeming to float, as it were, in liquid; (4) a large increase in the sensitiveness of the instrument; (5) the ability to regulate the magnetic intensity of the ring, and thus to compensate for local causes. This is effected by means of a second magnetized steel ring, smaller than, and inside of the first, the position of which—and therefore its neutralizing action—may be easily adjusted. M. Duchemin now proposes, as an improvement, the use of a set of such rings, forming a spherical or spheroidal system of still greater magnetic power.

UNIT OF HEAT.—The introduction of the so-called unit of heat in matters of research in this branch of science has been of the greatest importance, as it is evident that the degrees of the thermometer are no direct measure of the amount of heat present; for instance, there must be eight times more heat necessary to raise a gallon of water 10 degs. than to raise a pint of water to the same temperature; but the quantity required to raise a gallon 10 degs. and a pint 80 degs. is the same. This makes it clear that the amount of the substance heated must be taken into account as well as the temperature; therefore it has been agreed to adopt a unit, and to make this equal to the quantity of caloric necessary to heat one pound of water one deg. Fahr. Applying this principle to the heat obtained from coal, it has been found that the combustion of one pound of anthracite coal gives 14,220 units of heat; that is, that the combustion of one pound of this coal will heat 14,220 pounds water one deg., or 1,422 pounds 10 degs.; 142 pounds 100 degs., and 79 pounds 180 degs., thus raising the latter from 32 degs. to 212 degs.; in other words, by means of the perfect combustion of one pound of anthracite coal we may heat 79 pounds of water from the freezing to the boiling point. The perfect combustion of one pound of bituminous coal gives 13,500 units of heat, that is, one-twentieth, or five per cent. less than anthracite.—*Manufacturer and Builder.*

THE FRENCH METRIC SYSTEM.—Mr. Sellers read before the Railway Master Mechanics' Association an exceedingly interesting paper on this subject, in which he examined the cost of making a radical change in the standard measurement at this time, when the use of machine tools, gauges, etc., is universal, estimating the cost of changing and renewing the stock of an establishment equipped for 250 machinists at not less than $27,000, without any change in drawings, and the complete change at not less than $150,000. Mr. Sellers concluded that the adoption of the metric standard in this country is now neither practicable nor desirable.

IMPORTANT, IF TRUE.—According to a late number of *Les Mondes*, two French chemists have succeeded in converting the nitrogen of the air into ammonia without expense, without chemical manipulation, and even without human intervention at all, by the use of certain bituminous schists. These schists contain all the elements necessary for the growth of plants in much larger proportions than farm-yard manure. Sulphide of carbon is produced at the same time, and it is said to be this only remedy for the phylloxera.

CHEAP MANUFACTURE OF OXYGEN.—Mr. Mallet manufactures oxygen from the sub-chloride of copper. This salt has the property, when moistened and exposed to the air, of absorbing oxygen, forming an oxychloride. When this is heated, water is first liberated, then the oxygen, and the sub-chloride, in its original condition, is left behind. The process is claimed to be continuous, and 100 pounds of the material will furnish, it is said, 50 cubic feet of oxygen at each operation.

NEW ALLOY.—A new invention consists in the production of a metallic alloy resembling silver more closely than any alloys heretofore produced in color, specific gravity, malleability, ductility, ring and general characteristics. For these purposes the following metals are combined: copper, nickel, tin, zinc, cobalt and iron. In some cases, also, a small proportion—say one-half per cent.—of aluminum is added.

VANILLA FROM PINE TREES.—There have recently been submitted to the French Academy some small crystals which are the pure aromatic principle of vanilla. These, it is remarkable to note, were extracted from conifers.

Weekly Variations in Stocks.

Mining Stocks.

During the pest week the stock merket hes hsen dullsr and prices were lower thau was to have been expects4, allowing for the dstsrmiued efforts of the heare. The attack was mads principally upon the leading stocks. Rumors thet Cou. Virginia would reduce or pese the August dividend, that Crowu Poiut and Belcher had "petered out," that exploretious in the lower levels of Savags and other miuse had failed to reveal auy ore, etc., together with persistsnt ouslaughts iu the Board room, knocked these stocks down, aud they have hy no meane recovered. If the Comstocks had a bed time, the outside districts fared no better. But, whatever be the tone in speculative circles, there is no disputing the fact thet miniug proepects iu all querters were never more favorable.

Fluctuatiou iu certein etocke have been quite large. Alphe Cou., rauged hetweeu $11 and $12.25; Americen Flat, $6.50 and $7; Baltimore Con., $6.50 and $7.25; Belcher, $65.50 and $67; Best & Belcher, $22 and $24; Caledonie, $14.50 and $16; California, $35.50 and $38.50; Chollar, $47 and $52.50; Confidence, $10 and $11; Con. Virginie, $75 and $82.50; Crown Point, $67.50 and $70; Dardanelles, $11 and $12; Eclipse, $5.25 aud $6.50; Exchequer, $60 and $64; Gould and Curry, $17.12 and $19; Hale & Norcrose, $38.50 and $44; Imperiel, $7.37 and $8.50; Keutuck, $12.50 and $13.75; Kuickerhocker, $4 and $5; Occidental, $3 and $4; Ophir, $17.50 end $22; Overman, $27.50 and $32; Sevage, $50 and $63.50; Seg. Belcher, $70 and $75; Silver Hill, $6 and $7; Yellow Jacket, $66 and $73; American Flag, $1.50 aud $2.75; Eureka Con., $10 and $11.25; Meadow Valley, $4.25 and $6.50; Pioche, $4 aud $5.50; Raymond & Ely, $9.25 end $13; Chariot Mill, $7.50 aud $8.75; Golden Chariot, $5 eud $9.25; South Cheriot, $9 and $10.

A comperison of the higheet pricea for the wesk uuder review, as compared with extreme quotetioue of previoue week, ehowe the followiug more important edveuces: Alpha Con., 50c.; Amsrican Flat, 50c.; Empire Mill, 50c.; Exchequer, $1; Impsriel, 75c.; Ophir, $4; Overman, $1; Silver Hill, 50c.; Utah, 50c.; Americau Flag, 75c.; Chariot Mill, 50c.; Golden Chariot, $1.

The declines heve heeu, as usual of late, more uumerous. Baltimore Cou. fell $1.75; Best & Belcher, $1.50; Caledouie, $1.50; Chollar, $3; Con. Virginia, $1; Gould & Curry, $1.50; Hale & Norcrose, $6.50; Juetice, $1; Sevege, $16.50; Seg. Belcher, $8; Yellow Jecket, $6; Raymond & Ely, $2; South Chariot, $1.50.

FATAL MINING ACCIDENT.—At the North Aurore mine, ueer Hamiltou, Nevada, a stagiug gave way ou Thuredey leet, precipitating two men—James Martiu aud Joseph Washuanr—to the hottom of the shaft, a dietauce of 40 feet. One of the falliug timhers etruck Martiu on the heed, cruahing iu the eknll and inflicting a fetal wound. Waehusur wea severely hut not dangeronely iujured. The accident waa caused hy a large rock hecoming detached and falling down the ahaft, hreakiug aome of the timhere of the staging on which the meu were ateuding.

STRIKE NEAR BOZEMAN.—The Bozeman *Courier* ia iuformed that rich river minee have heen discovered ou the Miasouri, oppoaite Nave'e, and about eight milea from Radershurg; 25 ceuta to the pan have heeu ohteiued. The river prospecte well from the Three Forka to Nave's, and the greateet excitemeut prevaile in the aettlements contiguoua to the river.

MINING SUMMARY.

THE following is mostly condensed from Journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

FINISHED.—*Chronicle*, July 25: The McGlew furneces at the M. & N. W. mill will he finished to-day. Fires will he started ou Mondey, hut uo ore will he worked uutil they are thoroughly dried.

AMADOR COUNTY.

FROM DRYTOWN.—Cor. *Ledger*, Aug. 1: I seud you to-day samples of rock from the Gold Mouuteiu miue. The mine ie fully developed, opeued up and well ventileted. We have made eeveral cross-cuts through the ledge iu the tuunel; the lsdge is about 10 ft. wide and all good milliug ore. Galena eulphurets all through the ledge; also rich in free gold.

THE KENNEDY.—*Dispatch*, Aug. 1: The Kennedy miuiug company have finished sinking their new shaft, which has devsloped a large body of very fiue looking rock.

THE Amedor quicksilvsr miue is turuiug out some very rich ore.

CALAVERAS COUNTY.

MOSQUITO MINING ITEME.—*Chronicle*, Aug. 1: Garland'e mill was set at work upon rock from the San Bruno miue on the 28th. Ahout 100 tous of ore will be put under the stamps hefore makiug a clsau-up. The ledge showe 3 ft. wide in the face of the tuunel, the rock heing of au excellent quality. Good quertz ie also heing takeu from the mine of Lewie, Willett & Smith. Krim & Co. are also takiug out some good ore.

RICHER THAN EVER.—Yesterday moruiug we wsre ehown specimsus of quartz from the Sau Bruno mine evsu richer thau thoss meutioned in our last iseue. The specimsus were ahout equally composed of gold and quartz.

WEST POINT DISTRICT.—Mr. McNaughton is opsuing a fius, large vein near the Licking fork. Bill Briggs & Co. diecovered a very rich vein near the North fork, a short distauce from Zacatero miue. The ore ie over oue foot wide—csmeuted with gold. The Modoo Co., ou the east eide of the Valentiue mill, have commeuced atoping. The ore is excsllent and easily got.

COLUSA COUNTY.

QUICKSILVER.—Coluea *Sun*, August 1: Both the Buckeye aud the Elgiu coutinue to take out quicksilver. The latter eent down eight flesks lest wsek. The castiugs for the furnace of the Ahhott mine have bseu mads.

EL DORADO COUNTY.

MORE AND BETTER.—*Mountain Democrat*, August 1: Leouard Reeg, of Chili Bar, has ehown us a piece of gold-beering soapstone teken from the tunnel in the claim owned by himself and Peterson. This specimen shows a lerge proportion of hright, free gold.

MANSFIELD MINE.—Iu this mine they have struck a six-foot lsdge of decomposed quartz which gives highly favorahle proepects. The lowsr tunnel is uow iu 212 feet, aud is from 500 to 600 fest helow ths surface.

ITEMS.—*Republican*, July 30: Some good ground ie now heing worked at the Exceleior, Coou Hollow, just south of the city limits. The indicatione are that many tsns of thousauds will hs teken out of this miue by the oloss of the year. A littls lese tbau eeveu tons of rock from the Groes miue, cruehed at the Brswstsr mill, produced a 47⅛ ouuce pure gold bar ou Mouday last, bsiug equal to $110 to the ton.

FRESNO COUNTY.

CERRO BENITO.—*Expositor*, August 1: Iu Panoche Valley the reducing worke of the Cerro Benito quicksilver mine have again heen etarted up, the repeirs to the furnaces completed, eud the streams of quicksilver sre ageiu flowiug from the coudeusere.

INYO COUNTY.

SYLVANIA.—*Independent*, July 25: The Marriotte furuece here has a capacity of two tous of ore per day, working up to 96 per ceut. of the leed contaiued. The furnace is a reverheratory. From 2,300 ponnds of ore ruu through the Merriotte fnruace a few daya since, 937 pouude of hullion were obteined, coutaiuing silver to the value of $451.98. The Emma No. 2 mine, belouging to Louis Marriotte, hae quite a lot of good ore on the dump, 20 tone of which is to be put through this furnace immsdiately. This geutleman has discovered a large body of fire clay, sufficient to supply all demande of the camp. The Emma No. 2 ehows at 18 feet deep a three foot ledge solid, of grey carhonatee, assaying hy numeroua teate from $45 to $150 per ton. W. F. Kiucaid haa a sheft down 112 feet, the deepest iu the district, ou a silver ledge teu inchee wide at that depth, assaying $800 per tou. Also ou a leed mine called the Liheral, a ehaft 55 feet deep, with a four foot ledge, aud quite a lot of ore on the dump. He has aleo an opeu cut ou another ledge showing e face of 11 feet of epleudid leed ore, the hest iu the district. There ia about 100 tons of thia on the dump. Several locationa are made in a quartzite formation aome 300 feet iu width, which haa heeu traced aud prospected more or lese every 300 or 400 feet for 10 milea, or clear into the White mountaius.

LAKE COUNTY.

SULPHUR BANKS.—*Bee*, Aug. 1: There are 150 meu now employed at the Sulphur Banke hy the Celifornia Borax Company, miniug for quicksilver. The new reduction worka are nearly completed. The men are making bricks

ont nf the soil which contains the quicksilver, which are to be burned for the extraction of the metal.

Dr. Baker's Quicksilver Mine.—In this mine, near Lower Lake, some very rich ore was struck last Monday. They also discovered a cave, which was su full nf gas that the men conld not stand it, and wnrk hsd to be suspended.

MARIPOSA COUNTY.

From Mariposa Creek.—Cor. *Gazette*, Aug 1: The Italian mine (a 3-ft. vein) turns out $8 per ton. A small vein on tnp of the hill, near Bull Run, paid $12 per ton, and 10 tons taken from a ledge in Ben. Wills' field turned ont one nnnce to the tnn.

On the other side of Mr. Wills' house is another ledge abont the same size and character nf the above. These twn ledges, in addition to pnre gold, contain a fair percentage of rich sulphurets. The Blue Lead, near Mr. Morrison's ranch, varies from a few inches to 7 ft. in width, and has been opened abont 1,500 ft. in length, and st various depths; the deepest shaft is abont 70 ft. This mine has yielded nver $30,000 tn the lncky owners, most of which has been ponnded ont with a hand mortar, at very small expense. The Doss mine, which belongs to Mr. Brooks, is down 110 ft., and shows a vein all the way down, varying but little from 10 ft. in thickness, about all of which has been worked as pay-rock. Two hundred tons nf this, crushed by Mr. McCullongh, turned nnt $17 per ton; 400 crushed about two years since yielded $10 and $11 per ton in free gold besides 15 per cent. snlphnrets, worth $24 per ton.

MENDOCINO COUNT.

More Quicksilver.—*Democrat*, Ang. 1: We hear nf a new quicksilve strike, ssid to make a hnge showing, on or near Dry oreek, this county.

MONTEREY COUNTY.

Quicksilver.—Hollister *Enterprise*, Aug. 1: Twenty flasks of quicksilver were shipped to San Francisco on the 27th, from the Cerro Benitn mlnee. These mines are opening up splendidly, and shipments would have been much greater, recently, had it not been for an accident to the furnace, by which work in that department was temporarily suspended.

NAPA COUNTY.

Redington Quicksilver.—*Reporter*, Aug. 1: Last month's rnn amonnted to 900 flasks. Thie was the produotion of two furnacee only, the old furnace being in conree of demolition to make room for two othere that are to be erected, and for which 400,000 bricks are already prepared and on the gronnd. Only 125 men were employed dnring the month.

NEVADA COUNTY.

Grass Valley *Union*, Ang. 1: The run of the Idaho mill for the past four weeks has prodnced gold to the valne of about $45,000, which ineuree a dividend next Tuesday. The undergronnd appearance of the mine continnes good. The 800-ft. level has been etarted, and the shaft is also sinking for the 900-ft. level. The Empire has had a succeesful and profitable month's run. The clean-up for the past four weeks will realize something like $13,000. The New York Hill mine continues to show splendid ore in the tunnel. The ledge is now four feet thick in the breast and is certainly rich. The Seven-Thirty mine had a little crushing made the other day. Eight loads were put throngh the mill and gold valued at $1,168 was taken out—which is $146 to each load of qnartz. The Magenta ie making a good showing. The shaft is down 300 ft., and there are three levels run from it. A chnte from the 3d to the 2d level has been run, which gives good ventilation to the mine. The ledge ie from eix to fifteen inches in thickness, and has no breaks in it. The ore showe well in galena, heavy eulphurets and free gold. The Slate Ledge mine (Perrin's) ie doing well. The shaft is down 625 ft. on the incline, the ledge being very flat. The ledge ie over 3 ft. in thicknee in the present workings, and shows plenty of snlphurets, and some free gold. The ledge matter ie all worked, and, without any assortment of the rock, will mill at leset $10 per ton. All ie worked, since the milling is done by water power. Last week a cave occurred in the mine, whioh required six days for repaire. The cave, however, disclosed that there ie another ledge above the one now being worked, and that the npper ledge is rich in gold and gold-bearing snlphurets. The Omaha mine continues to ehow well. The ehaft ie down 90 ft. on the incline, and the north drift has been run about 60 ft., and the drift to the south is in about 40 ft. The rock in both drifte is good, and that in the north shows well in free gold. Reese, of Reese & Co., has frequently struck rich pockets in his ledge. One day this week he made an extraordinary strike at the depth of 80 ft. Ont of 57 ounces of decomposed qnartz, melted gold to the amount of 46 ounces were obtained. The Alaska mine ie situated on Ben. Franklin hill. The ehaft ie down 60 ft., and very excellent rock is being taken qut. In the county generally, mining hae been very active dnring the eummer so far, the gravel miners having a good supply of water. The North Bloomfield company will, by the first of October, have their tnnnel completed, and will then be able to commence washing off their immense body of pay dirt. They have lately, acquired, by purchaee, seventy-five acree of mining ground in the vicinity of French Corral. The Milton company are working their mines euccessfully, and are operating their twater ditchee so as to make them pay. At North San Juan there ie much life and prosperity. At Moore's Flst, differences between the miners and ditch owners, as to the price of water, still exist, and the miners are waiting anxiously for the Milton company tn get water into the Flst. The quartz mines aronnd Nevada city aro doing well.

PLACER COUNTY.

Bellevue.—*Argus*, Ang. 1: The dumps are full of high grade nre, and the mill steadily ponnding awsy. Will olean up to-day. A big ledge of rich ore is reported in the west stope and fnoe of the west drift of the 240-foot level. In the 150-foot east drift a new chute of ore is coming in, the ledge being 30 inches thick. On the 240-foot level a cross cnt is being driven sonth to tap the series of parallel veins that show on the surface.

St. Patrick.—Shaft No. 1 of the Crater mino is going down for the 500-foot level. The ledge is said to be well defined.

Rich.—Cor. *Herald*, Ang. 1: The Indian hill Blne Gravel mining company, at Gold Run, sre now taking out very good gravel, paying a little over four dollars to the car-load, of about 1,500 ponnde. They crush, with an 8-stamp mill, 1,000 car-loads in abont fifteen days, and as the whole cost for labor and milling is only about one dollar per car-load, it leaves a very handsome profit for the owners. The gravel is getting richer, and very rich retnrns may be anticipsted before the water sesson closes.

PLUMAS COUNTY.

North Fork and Vionnity.—*National*, Aug. 1: The North Fork Ditch and Mining Co. intend making an ontlsy exceeding $200,000; are now engaged in constructing a ditch which will cover the whole gronnd. The ditch will commence at the North Fork of Feather river, about 23 miles distant from the ground intended to be worked, and is intended to carry 1,500 inches of water. There will be over 8 miles of iron piping on the line of ditch, 22 inches in diameter, which will cost, inoluding the laying, $125,000. A contraot hae been let to a company of Chinamen to make about 2 miles of the ditch; the remainder will be made by the company, who in a few daye will have 400 Chinamen at work. They intend having the ditch completed and the water on the ground by first Dec. next. The Providence Hill Co. have their reservoir oompleted; aleo two ditches leading water from the reservoir to the hill, capable of carrying 1,000 inchee of water each, and have the mine fitted up with three monitore and all the late appliances for working a hydraulio mine. The Sunnyeide Co. have struck graved in their tunnel, and at last accounte were making fair wages. They are finding very heavy gold—piecee weighing 3 ounces. Messre. Rupe & Stevene are making $5 per day to the man. Kirkham & Co. are busy pntting in their wing-dam, and intend having it completed and the claim dry by Augnst 1st. Shin & Co. have suspended operations on their tunnel for the present. Stump & Co. will soon euspend operations on account of a soarcity of water. They have had a good run this season, making abont $4 per day to the man.

Another enterprise in thie vionity, is being undertaken by a San Francisco company, who propose taking a ditoh from the North Fork of Feather river above Independence bar, which will carry 3,000 inches of water, and eventually exteuding it down the river a distance of eix miles, for the purpose of working nnmerone pointe, benches and deposits of gravel along the banks of the river. Horse Shoe Pnint, the first ground intended to be worked, is about 3½ miles distant from the head of the ditch. It ie a large deposit of gravel, covering about 10 acree, with a dump of 70 nr 80 feet on every side; has been worked with profit for yeare in a primitive way with a small head of water.

Argentine Hydaulic Mine.—The Argentine mine, owned by Messrs, Heath & Jndson, is sitnated in the heart of a district through which run innumerable stringere and ledges of quartz, all carrying more or less gold. The bedrock is talcoee slate, carrying gold-bearing sulphurets which assay from $50 to $500 to the ton, while to crush the whole indiscriminately will pay from $5 to $20. A great portion of the quartz is decomposed, from which the gold readily frees itself upon being waehed, and it was this fact which induced the company to fit up hydraulio diggings. Their flume at the head is 1,200 feet long, dumping into a eteep cañon; thence the tailings run over a rough groundeluice 700 ft., when they are picked up by a flume and rnn through an undercurrent, after which they resume their travels, only to be canght up again by another nndercurrent. Thie operation is repeated four timee after leaving the main flume, and the tailinge finally dropped into Greenhorn gulch, about one mile from their starting point. From the fourth nndercurrent Mr. Heath cleaned up thirty ounces a short time siuce, and judging from that the final clean-up will be a good one even thie year.

SANTA CRUZ COUNTY.

Across the Bay.—Cor. *Enterprise*, Aug. 1: The coal minee, which were productive of so much excitement a few months ago, have not turned out so well as was anticipated. They have demonetrated beyond a doubt that coal of a good qnality exists in the Santa Lucia range; but, as yet, it has not been found in any considerable qnantity. Two promising cinnabar lodes have been discovered. One of these, known as the Guadalupe mine, ie situated about 12 miles sonth of here, near the rancho Los Laurelee. Ore taken from this mine resembles very much that taken from New Almaden, though, of course, it ie not so rich, as it comes from within a few feet of the surfsce. The other lode is situated abont 25 miles sonth of thie plaoe, and was discovered a few days ago by Captain A. Smith. These discoveries verify the npinion expressed by Prof. Whitney, that "there is a probability of cinnabar or qnicksilver being discovered in the hills back of Monterey."

SIERRA COUNTY.

Gibsonville.—*Mountain Messenger*, July 25: Mining operations are being vigorously prosecuted in this camp. The Rip Van Winkle company will wash 8 claims this year, whioh promise rich returns. Nine men have been working, night and day shifts, since the beginning of the water sesson. A clean-up of abont 30 ft. of their ground sluice, realized $600, among which was a 6¼ and a two ounce specimen. The Chalcedony are now taking out good pay, their claim recently yielding $18 per day to the man. The Bootjack are scattering things at a lively rate in their diggings, and contemplate soon putting in an engine. The Michigan company are opening their claim. The Washington, at Independence, are hydraulicing. The Nevada, Newark, are pushing ahead into pay gravel. The North America, Hepsidam, have their working apparatus in excellent order for the summer's campaign, and are pushing ahead with a large crew of men.

SISKIYOU COUNTY.

Quicksilver.—Yreka *Union*, Ang. 1: Two furnaces for reducing quicksilver are being erected at Borsx lske. The capacity of these two furnaces is forty tons a day and will yield, it is expected, forty flasks of quicksilver.

Eliza Mine.—An excellent prospect has been struck in the tunnel in which work is being done at the Eliza mine. The indications are better now for a large body of rioh rock than ever before since the claim has been worked.

Scales.—Fair Play diggings have paid $6,000 per month thie season, working two littlo giants; bank 200 feet high; blasting necessary; about five month's run this year. Cleveland company also using two little giants, which have paid well this seaeon. McChessney & Co. have turned out a respectable amount of the yellow stuff while water lasted.

Gradino.—The Green mountain oompany, at the head of Mt. Vernon ravine, are busy with a large force of men grading a ditch from Rook creek to their claims.

Port Wine.—The dissensions between the shareholders of most of the claims at this locality have seriously interfered with the proper working of their mines. The dirt averagee $2 per osr-load, the poorest yielding seventy-five oente. The ground is soft bed-rook and gravel, rendering blaeting unnecessary.

TEHAMA COUNTY.

Discovery.—*Independent*, Aug. 1: Considerable exoitement exists in the northeastern portion of our county over the report of the discovery of new and extensive mines somewhere on the head branches of North Feather river.

TRINITY COUNTY.

A Good Claim.—*Journal*, Aug. 1: Swift & Hurst are cleaning bed-rook. Their ditches present a fine appearance, and some of them, cloee up to the bank where bnt little dirt has been rnn throngh, were literally "lousy" with gold.

Large Bowlders.—Chapman & Fisher have a large array of boulders to contend with in their olaim opposite the old Arkansas dam. Some of them are 18 or 70 feet long, with a corresponding breadth and thickneee. One kept the blastere busy for five days before it was finally disposed of. Giant powder ie used exteneively and is found to work to excellent advantage.

Goon Prospects.—We saw a few pans of earth washed in the claim of Fisher & Prater, opposite the Arkansas dam, while in that eection last week. The prospeots were taken from the back of the olaim, and were good enough to make ne want to drop the quill and start in on the bed-rock again. They have a good ehow ahead of them for another year.

TULARE COUNTY.

Work in the Mines.—*Times*, Aug. 1: Quite a number of companies are engaged in making tunnels in the Mineral King mines. Some are now completed for 40 or 50 ft. Several loade that contain rich specimene have been discovered recently, and among others is the Crystal, containing ore which aseaye over $100 to the ton. We learn that Mr. Creighton hae purchased the first extension south on the Lady Franklin lode.

TUOLUMNE COUNTY.

The James Lick Mining Co.—*Independent*, Ang. 1: This mine ie situated one mile np the river from the Telegraph, and one mile from the Hazel Dell mine. The prospecting tunnel hae run on the vein 200 ft. from a ehaft, showing good rock the whole distance. A ditch has been rnn that will furnish water for a large number of etampe, and can be had in great abundance the year round.

Nevada.

WASHOE DISTRICT.

Rock Island.—Gold Hill *News*, July 30: This mine was located in 1860. It is situated in Gold Hill Mining District, just south of the Baltimore and American Flat mines. In 1863-4 a tunnel was run some 600 or 700 ft. into the mountain, outting the ledge, which at that point ie about 80 ft. in width. In 1864 operations were diecontinued and not resumed again until January of this year. Since that time work has been prosecuted constantly. A three-compartment ehaft has been sunk to a depth of 227 ft.; a station opened at the 200-ft. level, and a drift run toward the ledge, a distance of 160 ft. Some water is now coming in near the bottnm of the shaft, but not enough to impede nperations. The face of the west drift, from the 200-ft. station, is in good working gronnd, no water coming in. The prospects of this mine are favorable, as the tunnel above shows a very fair quality of metaliferons qnartz.

Consolidated Virginia.—Daily yield, 300 tons of ore. The ore breasts on the 1,300-ft. level, both north and south, are looking and yielding well. The ore stopes on the 1,400-ft. level are being extended north and south, and the ore is gradnally improving in both directions. The north winze, No. 2, from the 1,300-ft. level, has made connection with the 1,400-ft. level, giving a much needed circnlation of air. Sinking the north winze from the 1,400-ft. level to connect with the south drift on the 1,500-ft. level is making steady progress, passing downward throngh splendid ore. The main sonth drift, on the 1,500-ft. level, is making the nsual good progress notwithstanding the great heat encountered. The work of preparation for the erection of the new mill is making rapid headway.

Ophir.—Daily yield, 50 tons of ore. The ore breasts on the 1,300-ft. level are showing better and richer ore. The ore in the stopes raising up from the 1,465-ft. level is also richer. Raising up from the 1,700-ft. level, to connect with the winze from the 1,465-ft. level, for air pnrposes, is making good progress, and will be completed shortly.

Crown Point.—Owing to the excessive heat and some delaye in starting up the new incline hoisting machinery, the usual quantity of ore has not been extracted dnring the week. The new hoisting machinery was given a test trial on Monday last, and moved off with most perfect clock-like perfection. This hoisting machinery is of size and power that perfectly eclipses anything of the kind erected on the Comstock lode.

Belcher.—The prospecting drifts throughout the entire mine have been snspended for a few daye on account of the excessive heat and consequent bad air. The ore breaste throughout the entire mine are looking finely. Daily yield, 400 tons of ore. The new air shaft is being sunk with all the vigor possible. It is now down 215 ft.

Sierra Nevada.—Daily yield, 65 tons of ore. The ore breasts throughout the mine are both looking and yielding well. The hydraulio worke splendidly, and is fast tearing ont a big hole in the hill-side. The erection of the new hoisting and pumping machinery is fast approaching completion.

Imperial-Empire.—The pnmp columns are now in place nearly down to the 2,000-ft. station. This station ie completed, and a drift has been started at that point to out and prospect the ore vein on that level. A chamber has been cut out preparatory to sinking a winze below the 1,850-ft. level as soon as the air connections on that level are completed.

Gould & Curry.—The north drift on 1,700-ft. level is still advancing, the face in hard blasting quartz. Sinking the double incline winze below the 1,800-ft. level ie making the neual headway. The winze is being orowded downward for the purpose of opening a station at the 2,000-ft. level, to connect with the Savage mine for ventilation purposes.

Hale & Norcross.—Sinking the main incline below the 2,000-ft. level goee steadily on. Sinking the north winze from the 1,900-ft. level to connect with the main north drift on the 2,000-ft. level is making good headway, cutting occaeionally favorsble indications of ore. The north drift on the 2,000-ft. level is being pushed ahead to conneot with the Savage for ventilation purposes.

Overman. — Sinking the shaft below the 1,200-ft. level is progressing at the rate of 2½ ft. per day, the bottom still extremely hard. During the week a streak of fine ore, about 3 ft. in width, wae encountered in the north drift on the 1,200-ft. level, which still continues in the face. The main west drift on the 1,200-ft. level ie making good headway.

Savage.—Sinking the main incline for the purpose of opening the 2,100-ft. level is making the neual good progress, the rock in the bottom blasting out finely. The main south drift, on the 2,000-ft. level, is being driven steadily ahead to conneot with the Hale & Norcross. The north drift, on the 2,000-ft. level, ie also running to connect with the Gould & Curry for ventilation purposes.

Globe Conecliaten.—The face of the north drift from the incline up-raise is still driven northward in good ore. The west drift from the bottom of the winze, 95 ft. from the head of the incline, has developed a fine body of ore during the week, the quartz and ore strongly resembling the rich ores found in other portions of the Comstock lode.

Utah.—The flow of water in the shaft continnes much the same. The pump and water tanke prodnce very little effect.

Chollar-Potosi.—Daily yield, 100 tone of ore; assay value, $30 per ton. The ore breasts and stopes show but little change.

Justice.—Sinking the main incline progresses at the rate of 2½ ft. per day, and to-day a depth of 769 ft. ie attained. About 40 tone of ore per day are being extracted from the Waller Defeat section.

Florida.—New working shaft down to the depth of 210 ft. Rapid progress is being made in sinking.

Julia.—The enlargement of the main ehaft ie progressing at the rate of 15 ft. per day, the work being driven ahead at three different

[Continued on Page 92.]

Bag-Making in San Francisco.

There have been bags full of items concerning bags, their manufacture and their contents, spread by the press before the people of this coast; but the public probably have had a slight conception of the extent to which bag-making is carried on in San Francisco. This city has on several recent occasions "astonished the natives" in matters of home industry; and notwithstanding we have been credited with being slightly addicted to "tooting our own horn" in some matters, we think we may consistently put in a claim for modesty in the matter of home manufactures. The rapidity with which a new want is discerned and supplied, is in strict keeping with the promptness and enterprise displayed by Californians in mining, agricultural and other undertakings. In none of the active industries in which San Francisco has been engaged has the machinery run more noiselessly than in the manufacture of bags. The business has been followed to some extent for several years; but it has only recently assumed anything like a prominent position among the industries of the city. In order to give a correct estimate of its present dimensions, we clip the following from the *Evening Bulletin* of July 20th:

The industry is carried on at present in San Francisco by four houses, that of Detrick & Co., Neville & Co., Meyer & Weintraub, and Bardwell & Co. Of these, the factory of Detrick & Co. is one really worthy of San Francisco, both from the capital invested, the number of employés, and the quantity of bags made. It extends through from Clay to Commercial street, and occupies two stories. The first is filled by bales on bales of burlaps, hundreds of thousands of yards being kept in stock at the same time. From this story these are carried up to the second by an elevator, where they are quickly opened, and where they are measured off against cutting-boards provided with graduated scales. There are seven of these cutting boards, attended by as many youths and young men, who, having measured off the burlaps by a dexterous stroke of the knife, manage to cut as many as forty bags at a time. From the cutting-boards they are passed to the machine sewers. Of these there are seventy, tending as many machines. They average about five hundred bags a day each. Having passed through their hands, the bags are next taken by the turners, who are principally small boys, who turn them on turning boards with great dexterity and quickness. This is for the purpose of having the seams inside. Each bag having been examined three times to see that it is free from defects, it is thrown upon a pile. When these piles are large enough they are made into bales, carried down by the elevator, and are ready for shipment to any point on the Pacific coast. The capacity of the factory, which is now running full-handed, is about 30,000 bags per day. The season begins in March and ends in September, so that it is capable of making 5,000,000 bags during that time. Those really manufactured are of course much less. There are here employed altogether 130 girls and boys. The girls earn all the way from $5 to $14 per week, and the boys from $2.50 to $18 per week. They work by the piece. Nearly all the boys are entitled to be classed under that appellation, but the girls, while some of them are extremely young, others are of quite mature aspect. The work is carried on as quietly as possible, and but for the incessant click of the machines a pin might be heard to drop.

The character of all the other factories is similar to that which we have just noticed, save that they are of much less capacity severally. The bags intended for shipment are put up in bales of 500 each, each bale weighing 400 pounds. The Grangers have ordered, it is said, an immense quantity of these California-made bags—the house just mentioned having already sold them 1,250,000.

The manufacture of flour-bags is also growing to be a great industry, and the house of Detrick & Co., during the season, which lasts from the middle of July to January, makes about ten thousand per day. The same firm have a printing-press for printing the bags, and they are now importing a skeleton Hoe press for the same purpose. Besides the factories in the city, there is the jute and bag factory at Oakland, which has doubled its capacity this year, and a couple more throughout the country. It is estimated that 18,000,000 bags, worth $2,500,000, will be needed in the State this year, and that of these upwards of 8,000,000, worth $1,500,000, will be made in San Francisco, Oakland, and a few interior towns. But this is only a beginning, for as the cultivation of cereals spreads, the value of the industry will be increased year by year, in a ratio which it would be rash even to estimate.

Experiments with the view to organize a pigeon post are being made in Hungary, with the authorization of the Minister of War. A body of officers are engaged in fixing the stations for this service, which would be of great utility in case of war.

The increase in the production of steel in France, last year, was 29,125 tons, as compared with that of 1872. The manufacture is five times as extensive as it was in 1867.

Unsuccessful attempts have been made in Italy to raise the tea plant, and the experiment is now to be tried in the southern districts of Sicily.

The Big Wood Drive.

Although a great quantity of wood has floated down the Carson river since the big drive was started, a vast amount is still strung along the upper waters of the stream, and a good deal at the extreme head of the drive has not yet been started. At present there is a sort of wrangle between the owners of the wood and the men who contracted to bring down the drive, the latter being inclined to throw up their contract. In doing so, however, they wish the owners of the wood to refund the money they (the contractors) have thus far expended. This the majority of the owners do not wish to do. They want the wood brought down according to contract. Our readers will see that the bringing down of this great drive of wood—over 100,000 cords in all—is no light matter when they are told that the contractors have over 200 men employed and a great number of teams. Their expenses are said to be not less than $1,000 per day. The great trouble is that vast quantities of the wood now lie high and dry on ranches and out in flats along the river. This wood must all be hauled to the river and thrown into the channel. It was deposited where it at present lies at the time of the breaking of the big boom. As the wood rushed down the river it caught in places and formed dams which raised the water over the banks and sent thousands of cords of wood floating away into the flats, there to be left high and dry upon the breaking of the dams and the subsidence of the water. Notwithstanding all wrangles and troubles of other kinds a considerable quantity of wood is still floating down, and at all points along the river it is estimated that about 2,000 cords per day are being taken out. In the big cañon below Markleyville are many drifts of wood several feet in hight that lie far above the water. On many of the bars of the river are left similar large ricks. The wood drivers have quite an ingenious plan for getting afloat the wood on these bars. They purposely form a dam or gorge just below, raising the water till the wood is floated off, when the dam is broken and all goes down the stream with a rush for a time.—*Enterprise.*

Locating Mining Claims.—The San Juan *Times* says: A few days ago business called us up the ridge, and when we reached a point about half way distant between Cherokee and Columbia hille, we came across a party who were engaged in the landable object of locating mining claime. Our old townsman, John Barber, was one of the parties thus eogaged. He informed us subsequently that he had found as many as four mining claims that had never been located, though the ground all around his location had been taken up years ago. The precise point of this location is near Mark'e & Co.'s reservoir, in front of Jacob Kunse's house, between the Crusen road and the old road leading from Cherokee to Columbia hill. These claime are valuable. Marks & Co. have claimed the ground for many years, but under what kind of title we know not. We learn that other parties have located the ground occupied as a reservoir—the same allnded to—for miniug purposes. Within a few weeks past numerous locations of mining claime have been made between Cherokee and Columbia hill. One party, we are informed, have located the ridge for nearly a mile in extent, along the public road in front of Nixon's premises. Another party of thirty persons have located claims fronting on Bloody run, and between said run and Grizzly ridge. Thie last location is north of the Backbone house.

Burleigh Drills.—The new air compressor and Burleigh rock drills, at the Consolidated Virginia mine, were started in operation yesterday. Four-inch iron pipe extends from the surface and conducts the compressed air down into the mine, where it passes into the engines, which work the drills, through flexible gutta percha tubes one inch in diameter in the clear. The compressor above furnishes the air, which can be utilized in running a number of drills in different parts of the mine at the same time. This additional supply of air will also be a great relief to the miners, and improve ventilation. The air heretofore used was brought from the 1,200-foot level of the Gould & Curry. The new air pipe of the Consolidated Virginia will be extended to the 1,500-foot level of the mine. —*Virginia Chronicle.*

How to Judge of a City.—The average amount paid in the last five years in the United States for advertising was about $15,000,000 per annum. In 1867 New York City paid $80,000 tax on advertisements; Philadelphia, $30,000; Boston, $23,000; Cincinnati, $16,000; Chicago, $15,000; and St. Lonis, over $13,000. The wealth of the merchants in those cities and the extension of their business over the whole country, as well as the flourishing condition of cities themselves, shows what advertising may accomplish. It is a common remark among observing business men that the enterprise of a city may be judged from the appearance of the advertising columns of its newspapers.—*Louisville Courier-Journal.*

Deep Water.—The water in shaft No. 2 of the Sutro tunnel is now 850 feet deep, besides filling several large chambers and 400 feet of drifts 9 by 12 feet in size. The temperature of the the water is 95 degrees Fahrenheit. This water was struck in the drift or tunnel about 180 feet west from the shaft, and came in with a hissing sound through half a dozen perpendicular cracks in the face of the tunnel, forcing seams of spar out of the solid rock, as though it had been soap.—*Independent.*

Our Mining Frontier.

Only a few years ago some miners were killed by the adherents of Joaquin Jim, in the white mountain range. Others were driven from their claims, and have never returned to resume their work. Then the mountains in the vicinity of Columbus and to the southward, were beginning to be explored. Now and then a miner, more adventurous than the others, would go forth into the arid wastes of the southeast and return no more. This was then the border beyond which it was deemed unsafe to venture. Now the boundary is extended a hundred miles further toward the Colorado; but it has been done since 1867, at which time a detatchment of soldiers were sent to Fish lake valley to keep in check the Shoshones, who were committing murder in the vicinity of Red mountain and running off and killing stock in the neighborhood of Palmetto. Now Sylvania, Alida and Gold mountain, still beyond the former boundaries, constitute the frontier on the southeast, and verge on the outskirts of Death valley basin. Beyond this it is not safe for a single person to venture, with the determination of prospecting and mining. Now and then some try it. They are warned to leave and go about their business. They may be treated kindly, their horses taken care of over night, if they happen to fall into an Indian camp, but in the morning they must go on—it might be unpleasant to remain.

In the region of Black cañon there is said to be a band of desperadoes—Indians of the worst type, into whose hands it is dangerous to fall. But the region will be prospected. A line of labor and civilization is on the march. From Utah, on the East, through Lincoln and Esmeralda, into California; from Pioche and Panaganat to Gold mountain, and from there to Panamint and the mountains of San Bernardino there are thousands of camp fires which light the hills and mark the line of march of the pioneer. Tents are pitched, claims discovered, districts organized, townships formed and government established. Veins of rich ore abound in many of these border districts, which require a moderate expenditure of capital for developing the mines and erecting mills and furnaces for reducing the ores.—*Borax Miner.*

Pine Flat Mines.—A correspondent at Pine Flat thus writes to the Sonoma *Democrat* concerning the quicksilver mines there: The Ida Clayton, in Knight's valley, is proving to be a first-class mine. The owners are erecting a fine furnace, and will soon be ready to reduce the ore from the above named mine and also the Yellow Jacket, having made a fine graded road for that purpose. This mine is owned by W. A. Stuart & Co. They have made a survey from the Ida Clayton to a mill three miles distant, to a forest of pine, fir and mountain cedar, where the road connects with the Great Western mine, which will be but seven miles from Knight's valley, over one of the finest grades in the State, being but seven feet to the hundred. It would be well for Santa Rosa to think of this route, for they may as well have the trade as any other place. Pine Flat is improving rapidly; the new road from Healdsburg will soon be completed, at a great loss to the builder. This road will tap a fine mining portion of the district. The Georgia, Annie Belcher, Pioneer, Flagstaff, Rattlesnake, Sonoma and other mines will use this new road. The Missouri, Oaklin, Geyser, Emma, and Kentuck will travel the old road to Healdsburg for a while. I am told there has been a survey of late made to connect these mines with Cloverdale. The Oaklin mine will soon have three new and large retorts in operation, at which time they will be able to turn out about 90 flasks of metal per month. Some new discoveries near by are being made and have a good showing, and will no doubt prove well. The Hardy mine, now owned by Whitton & Co., is looking well. The Livermore mine is looking well; they have 300 tons of fine furnace ore on the dump.

Napa Mines.—Quite an excitement was occasioned in Calistoga on last Wednesday by a reported rich strike having been made in tunnel No. 3 of the Calistoga silver mine. At a depth of about 218 feet, the ledge being fully five feet wide, the assays had constantly increased until they reached, on Tuesday, $571 in silver and $60 in gold, making the unprecedented value of $631 per ton. The vein having gradually increased in value to this figure it is reasonably supposed that its richness will continue. In shaft No. 4, about 1,000 feet south of the location above named, the miners are only down about 40 feet; a three-foot vein of quartz has been exposed which assays now $321 per ton. This figure has been reached by a constant increase in the assays from the surface downward, commencing at $18, thence to the hundreds, until the highest figure has been attained. Messrs. Roberts & Robertson, owners of the Lost Ledge mine, have since the first of May shipped from their mine 170 flasks of quicksilver, all of which was secured by means of a small retort. They are now working sixty men, and will in a short time have a ten-stamp mill in full blast.—*Calistoga Free Press.*

Dayton Mine.—On Saturday last the spur wheel at the Dayton mine broke, and in 30 hours the water in the shaft gained 60 feet. The tanks are still in operation and are hoisting 45,000 gallons per hour.

Philadelphia has eight file manufactories doing a general manufacturing business, while New York has only one. Indianapolis has two.

Sutro Tunnel.

The main header of this great adit was yesterday in a distance of 6,356 feet; progress for the week, 60 feet. As men are becoming more accustomed to the use of the Burleigh drills, a gratifying increase of progress is shown each week. For the past three days the progress has been at the rate of 12 feet per day, in a heading of 12x9 feet. At present only two drills are at work. Cars for the removal of dirt are being rapidly constructed, with a carrying capacity of two and a half tons each, and as soon as a sufficient number shall have been finished, two more drills will be put to work and the work be driven ahead much more rapidly. For the enlightenment of the editor of the Gold Hill *News*, we will quote from the foreman's weekly report as to the temperature: "Thermometer, at 7 A. M., in the header, 75 degrees; at Shaft No. 1, 73 degrees; at the mouth of the tunnel, 75 degrees." In the language of the *Enterprise*, "what a refreshing current of air" would reach the miners above, and even below the 2,000-foot level of the Comstock, when the air shall be enabled to pass through a cool tunnel for nearly four miles, with a force sufficient to almost knock a man down; if, as at present, it maintains the surface temperature for a distance for more than a mile without outlet, and falls two degrees in the vicinity of an open shaft on the line. This would seem to indicate that when the tunnel is completed the temperature of the atmosphere, even on the 1,200-foot level, which the tunnel will strike, will be lower than at the mouth of the tunnel, instead of being twenty to thirty degrees greater, four and five hundred feet above, as at present.—*Independent, July 29th.*

Nevada Coal.—Mr. Wm. H. Day, of lower Gold Hill, showed us to-day a fine specimen of coal weighing about fifty pounds, which was received from a mine in which he was interested. This mine is situated in the Palmyra district, opposite the mouth of Seven Mile cañon, and about four miles north of Dayton. The vein is about two and a half feet wide, at the present depth of forty-five feet, but is widening perceptibly as the shaft is sunk. The coal closely resembles coal found in Illinois, but is not quite so hard. Mr. Day assures me that he has tried the coal, using it for various purposes, and that the tests were satisfactory in the extreme. We congratulate him upon the valuable discovery; as it will, in time, prove of great service and pecuniary value to him.—*News.*

The British Mercantile Marine.—In the British mercantile marine there are 40,000 persons, says the *Nautical Magazine*, who man ships coming to or from the United Kingdom, and do not include seamen manning British ships in the Colonies and abroad that do not come to our shores. These men may be classified as follows: Certificated masters and mates, 38,200; certificated engineers, 7,600; uncertificated masters and petty officers, 10,000; fishermen, 150,000; other sailor men, 151,200; firemen, stokers, etc., 14,000; stewards, etc., 5,000; apprentices, 11,000; other boys in merchant ships serving afloat, 7,000; boys in fishing boats, 13,000.

Lassen County Mines.—The Susanville *Advocate* contains the following: George Boyd and several other parties have struck very rich placer mines, in the hills above the Mountain Meadows. It is said that the deposit is quite extensive, and several claims have been taken up which prospect first-rate. Ward and Abel have commenced to work a claim on Gold Run, in a large bed of gravel, which they say prospects very rich. Frank Bosquet and a man from Virginia City have lately located a set of claims on the gravel range above the old Bosquet claim which are likely to prove valuable.

Tybo.—The mining company at Tybo, represented by McGee, will very shortly have the smelting furnace ready for operation. The one about completed has a capacity of 40 tons in every 24 hours. Two others will be constructed after the completion of the one now being built. There are three tunnels being run into the ledge, and wherever the ledge is tapped a very encouraging prospect is met with. It is said that one man can extract five tons of ore per day, the ledge being of immense width and can be mined without the use of powder.—*Courier.*

A great variety of articles, including grain-bags, wagon-covers, floor-covers, ropes, sails, etc., are made in Russia from the inner bark of the bass-wood, or linden tree, a million of trees being destroyed annually in the manufacture, and the value of the articles produced amounting to $2,400,000.

Of Iron.—The new fume arrester at the Eureka Consolidated furnaces is to be constructed entirely of iron. The trestle work will soon be built and the iron for the flue and stack pipe will arrive from San Francisco in a short time.

Sulphur.—The annual product of sulphur from the Sicilian mines is nearly 7,000,000 cwt., while that from all the rest of the world is only about 150,000 cwt.

The coal production of the United States amounted last year to 45,413,340 tons: the corresponding production of 1872 was 42,749,241 tons.

No other nation but the United States can boast of 75,000 miles of telegraph.

Good Health.

The Human Frame.

No. 9—The Bones.

Ths bony framework of our bodies, representing as it does a mechsnism permitting the most varied and complicated movements possible, consistent with tha integrity of the machine as s whole, is not the least remarkable portion of "the house we live in." It is a perfect adaptation of msans to snds; of physical structure to physical wants. Anatomists differ as to the aumber of pieces constituting the osseous syetem, some computing ths teeth and sosamoid bones, while others reject these, and reckon only tha trus bones. Including the patellas (knee caps), which though sosamoid ara always compnted, there are 206 distinct bones in the human skeleton. These are fastened, or articulated, together in a great variety of ways; as for instance, the compact, dentated articnlation of the cranial bonss, which will permit fractura of their aubetance befors the bones themselves will separate, and the free, "ball and sockat" joint of ths humerus (arm bone) with the scapnla (shoulder blads). Of course, having to subserve so msny different perposes, bonss are vary differently shaped. Alt tha scientific principles involved in architectura or dynamics are portrayed more or less faithfully in thsir construction and adsptation; as for a familiar example, the power of the arch to resiet superincumbent pressnre is well illustrated in many portions of the body, as the vaulted bonea of the skull, tho foot, etc.

As to their chemical composition, they consist of about one-third animal, and two-thirds earthy matter. The animal, or organic, matter is chiefly gelatin; the earthy, or inorganic, consists for the most part of the phosphate of lime, carbonate of lima, etc. As is well known, in old age the earthy matter greatly predominates over the animal, thns rendering the bone exceedingly brittle and easily broken; while during childhood the reverse is the cass, and the long bonea of the infant may be bent conaiderably without being broken. Under an unhealthy *regime*, or insufficient earthy food, this animal element preponderates to such an extent that it becomes a fruitful source of disease or deformity; producing most commonly that diseaee known as "rickets." This disorder is always a result of deficient nutrition, and can be remadied in almost evsry case by correcting and toning up the digestion, and supplying food which contains an abundant proportion of the phosphates.

It would be well, also, if mothers wonld besr in mind the tender, cartilaginous condition of the bones of their children in early infancy, and not encourags, as is too often done, the precocious use of the child's limbs. Nothing is more annoying to the thorongh anatomist than to aee little, puny children tottering abont on limbs which are bending beneath their load, and which, from this reason, are destined to cause their possessor to be dubbed in after lifs as "bow-legged."

Bones are very often diseased, broken or dislocated. In all such cases they should have the care of a competent physician; although it is wonderful to note, especially in the lower animals, the remarkable restorative power which nature sometimes exercises in cases of fractures, etc. We have freqnently seen instances where a bone has been broken and the two ends widely separated, when new bony material was thrown out and the bones united and presenting the novel appearance of a square "elbow" in their course.

Saccharated Calomel Contains Corrosive Sublimate.—Dr. Polk, of Philadelphia, iu the *Medical Times*, calls attention to the fact that corrosive sublimate is developed when calomel is rubbed np with sngar. He administered 10 grains a month after its preparation, with such poisonous effects as led him to test the compound, with the result as stated. He quotes from Alpins, who says: "When calomel is mixed in powder with white sugar, or calcined magnesia, or bi-carbonate of soda, corrosive aublimate is formed in 24 hours. Rather large quantities are formed in powders composed of calomel, white sugar and bi-carbonate of soda." We believe it is the general opinion among practitioners that the increased activity of the eaccharated calomel, which, by the way, is an old remedy, dependa on the increase of surface caueed by its diffusion. But the development of the chloride puts a serious face oa ths matter.

Women of Enoland and America.—We begin very much to doubt that the women of England are any more healthy than those of America, though the notion has a long time been prevalent. English women are larger, plumper and fatter than American women, but they do not perform so much work. American women are great workers, and have good powers of endurance. They are tough. If they would obey the laws of health they would be nearly or quite free from illness, except such as is inherited. It is said that English women are great walkers; but this does not indicate higher health, but habit.—*Herald of Health.*

Strychnine Poisoning.—A person who had taken five grains of strychnine for the purpose of committing suicide was snccessfully treated by skilful applications of chloroform, which alleviated the spasms. At the time a physician was called in, the poison had evidently been absorbed, and emetics were consequently nseless.

Muscular Movement Without Life.

The persistenca of motion in decapitated snakes, turtles and other low forms of life is familiar to every ons. It is commonly explained by the relatively large nervous ganglia, independent of ths brain, of sach creatnres. Bnt it appears that many if not all muscles may contract without that stimnlns of nervous action, with which alone we associate the possibility of conscious life. A striking illustration is givsn by Dr. Brown-Séquard in ths cass of two decapitated msn. Ths arms wsrs cut off; and for thirteen or fonrteen hours, their muscles contracted in responss to irritation by galvanism or mechanical stimnlsnts. Aftsr that length of time, all signs of lifs had disappeared. He thsn injected the blood of a msn into one of the arms and the blood of a dog into another. Local lifs was rsstored in both; the mnscles became irritable, and ths strength of contraction sxtremely powerfnl. In the arm in which human blood had been injected, the contraction was stronger than dnring life; yet ths nsrves remained quite dead.

On another occasion the same obssrver kept tho eye of an eol, removed from the body, at a temperatnre of 36° to 40° Fah., for a period of aixteen days. By that time ths eye was in almost complets pstrsfaction, yet the iris contracted when exposed to light. Nervons action was impossible, and muscular fibers themselves wers considsrably altered; yet they acted.

It is in connection with ths rhythmical movements of the heart and othsr organs, however, that the most striking proofs of muscnlar action independent of the nerve centers are fonnd. The diaphragm, for exampls, may be sepsrated completely from the spinal chord without interruption of its rythmio action. Similsrly the heart of a dog has continued to beat for forty-eight hours after its removal from the animal, and there is recorded the case of a man at Rouen whose heart was found to beat for 36 hours after the death of the body by decapitation. "I dare ssy," observes Dr. Brown Sèquard, "that the great cause why we see those organs stop at death so qnickly is that the phenomena of arrest of their activity have taken place at the time of death," the phenomena of arrest, we may add, being quite independent of the cessation of life. Other observers have demonstrated the rhythmic action of numerous other organs in man and the lower animals; motions that persist after, not death merely, but the entire separation of the parts from the rest of the body. Indeed Dr. Brown-Séqnard claims to have found that rythmical motion is a common property of all contractile tissnes, bnt one which shows itself only under certain conditions, different from the ordinary circumstances of life.

Still more remarkable is the fact that motions closely mimicking voluntary movementa can go on in the absence of conscious life.

Dr. Séquard mentions a caee in which he was called to see a man who was thoroughly dead of cholers, yet who persisted in certain complicated movements distressingly suggestive of life. The dead man wonld lift np his two arms at full length above his face, knit his fingers together as in the attitude of prayer, then drop the arms again and separate them. These movements were repeated many times, with decreasing force, until at last they ceased. To persons not knowing what may take place in the human body after death, these singular movements, observes the doctor, must certainly have looked as if the will powor had been directing them. In fsct, the family and friends all thought the dead man alive, and many tests had to be applied to convince them that death had really taken place.

It is worthy of notice in this connection that it is generally with the victims of cholera and other sudden and violent diseases that *post mortem* movements are most common, and consequently the suspicion of premature burial most likely to arise. That auch movements are wholly independent of life was demonstrated beyond a doubt by Dr. Dowler, of New Orleans, who adopted the heroic expedient of cutting off the limbs of patients, dead beyond hope of recovery from cholera and yellow fever. Notwithstanding their separations from the nervous center, the amputated limbs continued their seemingly voluntary movements. Whatever may have caused them, it is evident that these imitations of life were not due to anything that could be associated with consciousness.—*Scientific American.*

Air-proof Fabrics.—Air-proof fabrics ought to have only a very limited nse. In India-rubber or gutta-percha textnres we feel highly nncomfortable when we have to undergo mnch exercise, or have to give off more heat than usual. They become inconvenient, not beoanse they stop the change of air entirely, which they cannot do, in fsct, on account of the necessary openings in them; bnt only becanse they limit the universal exchange of air in the nnderlying garments. For protection against the wet from without they are well suited, but they produce another wet on our skin by impeding evaporation. They may be nsed in wet weather, when accompanied with cold or wind, but never, though wet, when it is warm or calm.—*Pettenkoffer.*

New Cure for Rheumatism.—Dr. Wagenhats, of Ohio, hss cured himself of two severe attacks of acute rheumatism, by inaulating his bedstead with a glsss tnmber nnder each of its legs. He has had the like success with two patients. How wonld boots with non-conducting soles answer to prevent rheumatism? —*Pacific Medical Journal.*

Useful Information.

Seasoning and Preserving Timber.

Thers are different ways of seasoning timber; the most simple is to dry it iu ths air under a ehsd, ths next to immerse it in water for a season, salt water by prefsrence, which disaolves somo of ths aap, which othorwise may promote decay; the next is to put it into a warm place, artificially heated, for instance by etoam pipes; this produces a kiln drying. A etill better way is to plaes it in a steam chsmber, where steam under high pressuro is introduced; this psnetrates into ths fibers and prspares ths wood for a more equal shrinkage when dried afterward; it is a kind of cooking process which coagnlates the albumon, and thus augments the solid mattsr in the wood, preventing lumber thus trsated from swelling afterwsrd by dampness, and to shrink by dryness only half as much as other lumber.

Ths exposnrs to steam-pressnrs is no doubt amoug the simplsst of the thorough methods. Expsrisncs has shown that an exposure of timber during two or thres wesks to high pressure steam will thoroughly season inch lumber, however green or wst it may be. Snch seasoning acts to some extent as a preservative; however thero are mors thorongh msthods of preserving wood, based on the joint action of tsnnin and iron. We are able to corroborate this principle, having before us a sample of moderate antiquity, bnt snfficiently old. It is a piece of white oak dowel which was for some thirty or forty years in pine flooring of Tiber cresk arch, Washington. It is black, perfectly sound, and as hard as ebony; it evidently owes its black color and hsrdness to the combined effect of the iron in the soil on which it was placed and the tannic acid in the wood itself. The cost of the materials for this process is small, as tannic acid pure enough for this purposo can now be produced for about 10 cents a pound, and even much less in the future, as it can be made from bark, young branches, and leaves of msny trees, which owe to that acid their astringent properties.—*Manufacturer and Builder.*

Use of Thermometers.—The differences in the ordinary meteorological observations are not so much owing to the defects of the thermometer, aa a general thing, as to the want of a proper csre in observation. To ascertain the true temperature of the atmosphere the instrnment should never be hung against the walls of a building, as the heat absorbed and radiated will cauee a change of several degrees, depending on the nature of the material of the walls and side exposed to snn or wind, as also the radiation from the internal heat of the building. The best place is under the shade of an open cover or tree, away from any buildings, suspended a few feet above the ground. The fact that the air may be at rest or in motion will not affect the temperature. To ascertain the heat of the direct rays of the sun the instrument should be covered with a coat of lampblack, and exposed to the direct rays of the sun in a sheltered place.—*Western Manufacturer.*

Hot Filtering.—The apparatus consists of a tube of soft sheet lead which can be wound around the funnel contsining the filter in the form of a spiral. One end of the tnbe passes through a cork in the neck of a flask, in which water, or other liquid of higher boiling point, is boiled; the other end dips into a receiver into which the condensed liquid flows.

Filtering Alkaline Solutions.—By using asbestos psper placed in the bottom of the filtering funnel, or by want of this, a plug of the asbestos fibers, in the same way as cotton is used for a aimilar purpose. Strong alksline solutions, which would destroy filtering paper, may be filtered.

Artificial Ivory.—A new process of msnufactnre is to treat cotton waste acted upon by sulphuric acid with a mixture of alcohol, castor oil and camphor, add oxide of zinc, and run the resulting paste through rollers. The product, treated with proper coloring material, may be also converted into artificial marblea.

Transparent Paper in Photography.—Paper dipped in a solntion of castor oil in alcohol becomes quite translucent after the evaporstion of the alcohol. To restore it to its original appearance the oil may be dissolved off by dipping in alcohol.

Every man who works indoors at any trade or pursuit which requires a cap on the head to protect the hair from dirt, shonld wear a paper one, instead of one of cloth or other heavy materisl. The latter so heats the head as to injure the scalp, and in multitudes of cases causes baldness.

An old and dirty sponge may be cleaned by first soaking it for some honrs in a solution of permanganate of potassium, then squeezing it, and putting it into a weak solution of hydrochloric acid—one part acid of commerce to ten parts water.

Qualities Necessary in Ships.—Strength combined with lightness; great capacity for stowage; safety; speed; durability; economy in repairs; cost; dranght of water.

Keeping Paste.—A few drops of carbolic acid stirred into a pint of common flour paste will preserve the paste in a good, nsable order for a long time.

Artificial Flowers of Tin.

In a recent number of a Berlin journal we find the following directions for making accurate copies of natural flowers and leaves from ordinary sheet tin: The method is somewhat similar to that employed for wax flowers, but the dies, of course, require to be made of stronger material. The leaf or petal to be copied is first oiled on one side, and then laid lightly upon some dry plaster Paris, or very fine sand, in such a manner that this oiled surface is nppermost. A little bank of clay is built around it, and the mixture of plaster Paris and water poured in, care being taken to remove the air bubbles with a soft brush. Instead of plaster Paris paste, melted etsarine, mixed with powdered gypsum, may be employed, where the leaves are quite thick and strong. Very delicate leaves must first be painted over with a brush dipped in soap water, after which several thin layers of plaster Paris are applied with a brush, fine wire being introduced to give it firmness. The leaves thus prepared are either oiled or used to make plaster casts, or they may be coated with black lead and have copper deposited upon them by electricity. The upper stamp having been formed, the mstrix, or lower stamp, is easily made from this. The tin is first cut into the required shape, either by hand or by a suitable die, and then pressed into the required shape between iron or steel stamps, cast after the plaster molds just described. Each of the pieces required to form a flower, having been prepared separately, are carefully soldered together, a stem and leaves added, and the whole object so bent and twisted as to avoid the appearance of stiffness. They may finally be painted with the natural colors and varnished.

Cutting Glass Bottles.—Take a good three-cornered file, file a circular notch around the middle of bottle; let the notch be at least 1-16th of an inch deep, and, if the glass is very thick, ¼ of an inch. Into this circular notch fasten a soft small lamp wick or thread of tow, well moistened with alcohol, taking care not to wet the surrounding glass surface. Light the thread, which should be large enough to fill the notch and not wound too tight, and while burning revolve the bottle in the hands, taking hold of the ends, and holding it horizontally so as to confine the flame to one particular part. When burnt out, plunge the bottle at once into cold water. If necessary, repeat the heating and cooling suddenly.—*Artisan.*

Removing Grease Spots.—In taking out grease from clothing, with benzole or turpentine, people generally make the mistake of wetting the cloth with the turpentine, and then rubbing it with a sponge or piece of cloth. In this way the fat is dissolved, but is spread over a greater space and is not removed; the benzole or turpentine evaporates, and the fat covers a greater surface than before. The only way to remove grease-spots is to place soft blotting-paper beneath and on top of the spot, which is to be first thoroughly saturated with the benzole, and then well pressed. The fat is then dissolved and absorbed by the paper, and entirely removed from the clothing.—*Journal of Chemistry.*

Cement for iron railing tops, iron gratings to stone, etc., of a very excellent nature can be manufactured by taking equal parts of sulphur and white lead, with about a sixth of borax; mix the parts together until they form a homogenous mass. When used the mass is wet with strong sulphuric acid, and a thin layer of it is placed between the two pieces of iron, which are then pressed closely together. In five days it will be perfectly dry, all traces of the cement will have vanished, and the iron will present the appearance of having been welded.

Removing the Teeth of Children.—The operation consists in simply slipping a rubber ring over the tooth and forcing it gently under the edge of the gum. The patient is then dismissed, and told not to remove the appendage, which in a few days loosens the tooth and causes it to fall out. Grown children, who shrink from tho shock and pain of the dental nippers, may also have their teeth removed by means of the rubber, which is a mild form of treatment.

Casein is the name applied to the nitrogenous constituents of milk, which are coagulated by acids, and which have received this name from their use in the manufacture of cheese. A portion of the nitrogenous snbstance, known as albumen, is coagulated by boiling, and then forms those repulsive little films generally met with in boiled milk. Casein is soluble in fresh milk, but insoluble in milk which has turned.

The fracture of a steel wire containing, say, seventy-five per cent. of carbon, when seen under the microscope, presents a tolerably flat surface, composed of innumerable small, sharp, crystalline points, while that of iron is rough, more or less fibrous or mossy, and the fibers do not end in sharp points.

Softening Violin Notes.—M. Laborde states, in *Les Mondes*, that the disagreeable rasping tone peculiar to some violins may be avoided by placing a small strip of wax on the upper portion of the bridge. The notes are immediately rendered sweet and soft, and can be suited to the ear by regulating the size of the piece of wax.

Powdered chalk, added to common glue, strengthens it. A glue which will resist the action of water is made by boiling one pound of glue in two quarts skimmed milk.

SAVING THE SULPHUR IN COPPER SMELTING.

Mr. Spence, of England, some 12 yeare since, tnrned his attention to the saving of the sulphur evolved from copper ore in the process of roaeting. He erected a small experimental furnace about 12 years ago, on what he denominated "eound ohemical principles," which proved a most satisfactory success. It required but s small expenditure of fuel and labor to eliminate the sulpbur from the ores as fully as required in practice, and oonvey tbe same to the vitriol chambere as sulphurous acid gas. Very soon afterwards he erected additional furnaces on a large scale, and all the sulphuric acid made at his works, for the last ten years, has been obtained from furnaces of tbis deecription. The amount of sulphur waeted in copper smelting, in England, and which might he economized by tbe use of furnaces of this deecription, is enormous. It has been estimated at 70,000 tons per annum, which would be wortb something like two snd a quarter million dollars.

FIRE ALARM IN THE BELCHER MINE.—Wednesday evening, of laet week, about 8 o'clock, there was an alarm of fire and a grand stampede in tbe Belcher mine. It appears that some decayed timbers were being blasted out of an old drift of tbe 1,300-foot level of the Belcher, near the Crown Point line, when some of them took fire from the blast, they being eaten up with the dry-rot and as inflammable as punk. Thoee who knew what wae the matter procured one of Babcock's fire-extinguishere, kept on the level, and pnt out the fire. But in tbe meantime the alarm had extended to the men on the level and throughout the mine, when a panio and a grand stampede for tbe surface eneued, and meet of the men were hoieted out of the mine before the alarm subided.

GREAT Britain has 396 paper mills; Franco, 634, and Spain, 139.

Mining as a Legitimate Enterprise.

We clip the following from the Calaveras *Chronicle*:

"The Yellow Jacket and Carey Conaolidated company, which erected steam-hoieting works on s wortbless feeder, near the Obio, bave shut down. It ie to be hoped that the company will use better judgment in the future, or employ a competent person to judge for them."

We know nothing of the circumstances which called forth the above item, nor whether it is a just criticism or not upon the management connected with the company to which reference ie made. We have merely placed tbe item at the head of this article ss a text for the few words wbich msy follow, and wbich, while they may have no application whatever to the mine mentioned, will certainly be applicable in many cases, which msy be readily oalled to mind hy any one who has had much experience in or knowledge of mining in California.

Tbe successes in quertz mining on this Coast may be coneidered the exceptions rather than the rule. In the early days of mining here, there might bave been some reason for such a result; but of late years we have not been wanting in men who are sufficiently well experienced in all the science and intricacies of both milling and mining for the precious metals, to eecure, as a result of their efforts, as fair a percentage of profit as oan be derived from any of the legitimate pursuits of life, involving the same amount of capital and skill. We believe that very few of the failnres here oan be properly attribnted to the oharacter of the mines themselves. The only wonder is that they bave paid ae well as they have, considering the recklees system of mansgement eo generally pursued; bnt we trust that we have seen the worst of such things, and that better times in this regard are in store for our early future. Intelligent, honest and economical management will do more to give our mines a good reputation abroad, and bring capital to our aid, than anything else which can be done to further thet object. It will aleo secnre the beet possible reeults for our home investments and labor.

There is nó question shout tbe valne of our mines, or of the fact that vast riches lie scattered all about our mountains, waiting for the hand of industry and skill to come snd gstber them np. Hence mining may and should be made profitable; and it might he made ae profitable and reliable ss most other industries, if only properly managed, snd with as much regard to economy ss is practiced in other callings. Mining is not only important in itself, but it vitalizes and stimulates every otber business. Yet, praotically, our merchants, manufacturers, farmers and capitalists reject it, or are unwilling to embark therein.

One of the chief reasons assigned for thus ignoring so important an industry, is the acknowledged fact that since the partiel exbaustion of surface mining, tbe business has largely fallen into the hands of sharpers and speculatore, wbo generally make their money by victimizing the ignorant or unwary, inetead of depending upon tbe actual produots and legitimate profits of mining.

Another source of trouble and discouragement arises from the fact that eo many mining operations are conducted in such a reckless snd extravagant manner, that it seeme as though the object wae to spend the most money and realize the least possible results for the stockholders, who find, too late, that their agente and managere have been "going it blind," generally through ignorance or a lack of the ability and experience necessry to enoess in such operations.

Failures tbat are attributed to the high rate of labor, or a worthless mine, are too often found, on critical and intelligent examination, to result from too extensive, too expensive, or ill adapted machinery; too much cost in the management of nnnecesaary corporate associations; too much ignorant expenditure in speculative experiments; too little intelligent, practical mining, and a consequently too small percentage of the precious metale saved. Hence the distrnst and suspicion that bss so generally fallen npon mining ss an investment.

There is one other great drawback to mining enterprise, snd tbat ie too mnoh waiting for capital. There are thouands of minere ecattered throughout the mountains of California, Nevada, Colorsdo, etc., who are in poseession of mines as yet undeveloped, but really valuable, but who will do nothing whatever towards developing them; they are simply wsiting for capital, and large capital at that—tbousands instead of hundrede. How much better would it be for such men if they would combine into a co-operative enterprise, ae people are now doing in almost every other branch of industry, and become independent of capital.

Now to counteract these evil tendencies, and build up this great and important industry on a sound and reliable basie, it ie nececeary that all who are practically engaged in mining or who have money to invest thorein, should employ or combine with none hut thoee who are capable and honeet. See tbat only the most experienced superintendente, those who have a well known record for ability and heneety, are put in charge of the general management, and place none hut the best practical miners and mill-men at the head of the various departmente connected with the hnsiness, instead of the cbeap and unreliable class of men too often employed. Let such a course be pureued and the confidence of capitaliets abroad in onr mines, now well nigh destroyed, would soon he renewed on a firmer base than ever.

In sddition to tbe cansee already enumerated many failnres are also due to tbe fallacious idea that knowledge is of but little conseqnence in locating or operating a mine or mill, or in eelecting and arranging the machinery for the same—that any person who hae businece tact and knowledge snfficient to navigate a steamboat or run a saw mill, and who has had no other experience, is fully competent to mansge a mine. That any person, whoever, connected with mining sbould be found to disregard the neceseity of applying scientific knowledge to aid the operations of tbe miner, notwithetanding the indubitable evidence that it has done so much for the advancement of mining, ie greatly to be deplored. Practical men, combining scientific with practical knowledge, are undoubtedly the men best quslified to insure success; but practical men merely, especially those whose experience has been confined to one or two localities only, are as unsafe as the mere theorist. The one is guided solely by what he has seen, the other by wbat he hae read. What is wanted is the educsted man whose study has gone hand in hand with prsctical working in the mine or mill. Fortunstely we now have such persons in numbers fully equal to the demand, and there is no need of such failures as the one noted at the head of this article or any similar ones anywhere.

In locating and working a mine, either for gold or silver, measures may and should always be taken to know positively before the erection of a mill, that the company hae a mine sufficiently well developed, and of tbe ne essary riohness to aeenre at least a reasonable degree of success. Tbis may readily he done by a proper exploration of the same by means of drifts, sbafts and tunnels, and the character of the rock fully ascertained. Such exploration will cause no delay, for it is impossible to obtain sufficient rock from any ordinary mine to keep a mill running, until a large amount of preliminsry work has been done; and it is mnch better to lose the ontlay for *such* work alone, tban, by injudicions haste, to add to it the cost of a mill and its immediate acceeeories. By careful observstion, and the collection and collation of numerous facte, mining has been reduced to a science, accessible to all who bave the necesesry ability and experience to inform themselves, or who will take trouble to do so. It is a progressive science, however, to which new facts are being conetantly sdded, snd he who would practice it successfully, or employ it as a means of pecuniary gain, should be constantly on the slert for the latest development of facte or latest improvement in machinery in sll its various appliances in both mill and mine.

Engineering Two Thousand Years Ago.

Perhaps some of tbe most remarkable remains of ancient engineering are those which were diecovered hy excavations made, some 10 or 12 yeare since, a short distance from Rome, snd near the ruins of the ancient city of Alatri. This city was eurrounded by massive walls, and located on a mountain or elevated point, snd ill provided with water. About 150 yeare before Christ, as we learn from a Roman inscription, an immense aqueduct was built to bring water from a neighboring mountain better supplied with that element. We are furthermore told that this aquednct was 340 feet high, supported upon arches and provided with *strong pipes*. The topography of the country, moreover, sssures us that the water supply oould not have been conducted into the city, even over suob high snpporte, except by pipes—an inverted eyphon—the lowest point of which must hsve been some 340 feet below the point of delivery, or nnder a presenre of at least ten atmoepheres. The excavations already alluded to ehow that the aqueduct must have been of large size, as the piere of the arches sre not less than five feet nine inohee in hreadth, while the total length of the syphon must have been between four and five miles. Tbe question naturally arises—How, and of what material, wae this syphon huilt? Ae iron pipes of large dimensions, if of any dimensions st all, were not known at tbat era, we can look only to masonry or wood-work for the material of ench construction. Poesibly a olue bas been found to tbe the mode of their oonstruction by a euhsequent discovery, near the same locality, of a field, euppoeed to have been the eite of an ancient parade ground near thie once walled city of Alatri. A complete syetem of underground drainage has been revealed at a depth of ahout seven feet helow the surface of the field, effected hy a well oonetructed syetem of pipes made of fire clay, sach about eighteen inches in diameter. It is possible that snch a pipe, of lsrger dimensione, snd strengthened on its exterior by a strong and massive hulwark of masonry, may have been tbe meane of oouveying the water into the city. But however that end might have been attained, the work was certainly a most wonderful feat of engineering, considering the oondition of tbe mechanic arts of that early day. Tbe excavations and discoveriee tbus brought to light, and so fnlly oonfirming the trnth of the anoient inscription, were conducted by order of the present Pope, and under the immediate supervision of the well known Italian scientist—Father Secchi.

THE Département of Agriculture estimatee tbe consumption of timher during the preeent decade at one hundred millions of acres, or an average of ten millions of acres per year.

Academy of Sciences.

Tbe Academy of Sciences held its regular meeting on Monday evening 1sst—Profeesor Davidson in tbe chair. After the acknowledgment of a long list of donations the following gentlemen were elected as regular members: Hon. Cornelius Cole, Professor T. Gueran, Carl G. Schneider; and James Falkner as corresponding member. Six names were also proposed for membership.

The New Constitution.

The cuetomary pspere and discussions on scientific eubjects having been laid over, the new conetitntion and by-laws, ss reported by the committee on that matter, were taken np for consideration, and after oonsiderable discussion were finally adopted as a whole. This document has been drawn up and considered, in committee, with great care, and with special reference to the expected important change in the pecunisry condition of the Academy. Heretofore tbey had had little property, and now ss they had what might be called great expectations, it was necessary that the affairs of the Academy should be transacted in a thoroughly legal way. As several points in the old constitution were comparatively weak for the present condition, tbe committee had studied tbem by the laws of otber ae sociatione, and had endeavored to arrive at a better means of electing the officers of the Academy, and also of putting restriction upon the character of those who are elected members—not a restriction as to tbeir scientific qualifications, but whetber the man who comes in among them is a man of probity and honor, or whetber there is some black mark to his cbarscter which should disqualify him.

Following are the main provisions: Its membership is to consist of resident, life and honorary membere. Esch applicant for life or resident membership must be proposed in writing hy two or more resident or life members, snd tbe nsme, occupation and residence of tbe applioant be posted in a conepiouous place for not lees than one month. At the next meeting the Council shall determine by hallot whether the applicant is worthy, and shall report at the next regnlar meeting, whereupon the applicant shall he balloted for. Honorary members shall be elected only at the annusl meeting. Each candidate to he elected must receive the votee of four-fifths of tbe membere voting. Any resident member may become a life member by payment of $100. Corresponding membere shall be elected for one year. The business of the Academy ehall be transacted hy the resident and life members from whom tbe officers ehell he elected. The number of honorary members shall not exceed 50, of whom 30 shall be residents and citizene of the United States, and 20 of foreign countries. Seven trustees shall he elected who shall have under their charge the property of the society, and shall transact all affairs relative to the temporalities thereof. Tbe trustees shall elect one of their number as President, snd ehall also elect a Secretary. Tbe trnstees shall have power to require from the officers snch bonds as shall be security for tbe faitbful performance of their duties; and tbey shall elect some bank in which to make deposits on behalf of the Academy. At the annual meeting, the trustees shall present a detailed statement of their proceedings, together with vouchers, and a full sccount of all property, real aud personal, and of tbe condition of the corporation.

Whenever the trustees shall have in their hands fnude not needed for tbe immediate nse of the Academy tbey sball have the power to loan the same npon such terms as sre advisable, but no loan sball be made except upon mortgage of uninoumbered real estste, the value of which sball be twice the amount of the loan, or upon bonde of the city or State. No loan shall be made except hy vote of not fewer than five trustees. If any loan he made contrary to these provieions, the trustees making the same ehall be individually liable for the money eo loaned. The trustees may invest the money of the Academy in bonds of the Stste or city. The officers of the Academy shall he a President, First and Second Vice-presidents, Corresponding Secretary, Recording Secretary, Treaeurer, Librarian and Director of Mnseum, sll of whom mnst have been life or resident members tbree years previous to their election. These officers shall conetitute a council for the transaction of such hueinese as may be assigned to it by the Academy. The President of the Academy shall be President of the Council. The Council may not incur any indebtedneee unless authorized by the trustees. All of the officere are required to make annual reporte and special reports as may be considered requisite. Medals and prizes may be given by the Council, and bequests may be accepted by the Academy.

PRIEMOIDAL RAILWAY.—A model of Crew's prismoidal railway is on exhibition at No. 331 Montgomery street, in this city. Tbe trsck employed in the construction of this railway is in the form of a prism having one track at the apex of the two inclined sides, upon whiob tbe main driving wheel bears, while a small wheel hears upon each of the inclined sides of the priem and at an angle to tbe main wheel. Tbe inventor claims many advantages over the ordinary railroad system. Cnts are heing prepared and when completed we shall illnetrate the invention in the MINING AND SCIENTIFIC PRESS.

The Mammoth Pavilion Accepted.

On Friday, July 31st, the Pavilion of tha Mechanics' Institute Fair was formally transferred from the hands of tha contractnr, Mr. James Drury, to those nf the Board of Mansgers of the Associatinn. Besides the Board of Managers, a number nf luvited guests were present, incinding several members of tha press. The Rural Press being duly represanted there, and, as many of tho facts counectad with the construction of tha building are of a very interesting character, wa propose to lay a few of them befora our readers.

On the 7th of May the contract was awarded; and nnly threa months previons to tha date of nur prosont issua much of the lnmber of which the Pavilion is constructed was growing in the forests of Oregon. Many of the timbers were cut to ordar to suit the vast dimensions of the hnilding. Some of thesa timbers measnre 80 ft. in length, 12x12 in., without a knot nr flaw. Tha materials of which the structure is composed ara as follows: 1,703,000 feet of lumber, exclusive of shingles, which were 1,398,000 in number; 190,000 bricks for foundation; 4,000 lbs. nf iron bolts; 306 kegs of spikes and nails. The building contains 6,287,000 cnbic feet, covering abont 4½ acres of ground. The hight of the great exhibition building, from the floor to the arched ceiling, is about 90 feet. The first floor does not cover the whole srea of the building, a wide spsce on the east side being appropriated to the display of hortionltnre.

The exhibition rooms of the nppar floor extend nearly the full length of the building; the west side being reserved for tha art gallery. A promenade 16 feet wide extends aronnd those nppar exhibition rooms. This is to be kept exclnsively for promonading, and will offer tha most favorablo point for forming a general conception of the size of the bnilding. A person standing at one end here and observing a group of men at the other end, could hardly recoguize his friends among them—no matter how well dressed they might be. It is estimated that on the side opposite the picture gallery—inclnding promenade—a thousand soldiers could parade.

The massive arches that span the enclosuro, and the ornamental balnstrade that borders the promenade, give to the hnilding, even in its present nnoccupied condition, a very inviting appearance. Bnt when all the exhibiting space is filled with the choicest products of industry and art, when tha unoccupied space below, and the promenade above are thronged with delighted spectators, the whole hrilliantly lightad from fonr thousand gas burners, the plants and fountains in the horticultural dapartment refreshing the eenses with their delicate infineuce, a scene will ha produced such as the spectator may not see duplicated in a lifetime. We hope our rural friends will andeavor to so time their visits to San Francisco as tn enable them to take their places among tha tens of thousands who will visit this exhibition daily.

Mr. Drnry, in completing his contract, rather startled the oommnnity, heing ona week ahead of the specified time. This gives the managers ampld time to complete the inside arrangemants. They are now "masters of the situation" at every point.

The almost incredibly short space of time in which this mammoth building has been constructed may possibly arouse a suspicion that it has been done in too hurried a manner, and at the sacrifice of thoroughness; hut snch is not the case. The Building Committee was composed of men who would have permitted nothing of this kind, even had tha contractor heen so disposed; and one of the most plaasant features of the pleasant ocoasion of last Friday was the extreme satisfaction expressed by all the managers with the manner in which the work had been done. In regard to this matter the unanimous thanks of the Board were voted to Mr. Drury. The pavilion, aven in the course of its construction, has been one of "tha sights" of the city, and has heen visited hy thousands, and the work examined by nnmhers of competent jndges. We hava not heard a word of unfavorable oriticism. Every considerstion has been given to tha safety and comfort, as well as to the entertainment of visitors.

In locating the pavilion, the managers chose a situation most accessible hy the street railroad cars, and in as olose proximity as possihle to tha business portion of the city. The building is located on Eighth street, extending from Market street to Mission street. The lot upon which the pavilion is erected is an extremely valuahle one, and could scarcely be purchased at any price; but the owner, Mr. A. B. McCreery, generously granted to the Mechanics' Institute a lease of the lot for a term of five years, for the mere nominal consideration of paying the taxes and street assessments on the property during that time. The Institute has the privilege of retaining possession of it the sixth year by paying $7,500. The managers were truly fortunate in securing this desirable location on such extremely favorable terms, and the generosity of Mr. McCreery is duly appreciated hy the whole commnnity. The entrance for visitors is on Mission street, and comfort and convenience in ingress and egress have been well provided for here. The upper story of the building juts over the sidewalk, forming a covered way by which visitors can enter from carriages or cars without exposure to the weather, and also protecting the spacious entrance from driving dust and rain, shnnld storms occur.

Ona of the conspicuous enterprises connected with tha approsching axhibition is tha publication of a daily paper—tha "Mechanics' Fair Daily."

This is to be published by Dewey & Co., proprietors of the Scientific Press and Rural Press. The managers nf the paper, lika tha managers of the fair, are fully np to tima in their arrangements. The exhibition opens on August 18th, and will continua from four to six weeks.

Peterson's Patent Bee-Hive.

The accompanying out represents tha "Peterson Bee-Hiva, invented and patented by Peter O. Petersnn, of Oakland, Alameda county. A model of this hive has been nn oxhibition at the office of tho Rural Press for some weeks past, and has heen examined by nnmerons parties, and favorably commented on. The invantor is a practical baa keeper, and has made the various improvements combinad in this hive as the necessities of his bea-keeping experienco reqnired. It is therefore not a product of theory, each of his improvements being suggested by some want and thoronghly tested.

This Hive is a California invention, simple in its construction, and is cheap onough for tho amateur or professional bee-keeper. Among the paramount objects secured by this Hive are the facility it affords of examining at all times the etores of the bees and the taking away of any surplus, or supplying whatever may be wanting. Also, the presence and state of health of the queen bee, and in fact of the whole hive. It enables the keeper to interfere in all sorts of emergencies; increasing the number of bees by artificially creating young swarms, and what is of especial importance to the progress of bee science, can be thoroughly examined with reference to the behavior and habits of the different bees, queens, drones, and workers, without interfering with their daily labor. An important point is, that being a low hive it gives the bees less labor and a better chance for production of honey. By the peculiar construction of the Hive, the drones are unable to get into the place where the bees keep the bulk of their honey.

The engraving of the hive shows the peculiarities of its construction. B are the breeding frames, c the

honey frames; C is a partition to prevent the drones from getting into the place where the bees store the bulk of their honey. The slats, *a*, are intended to cover the breeding frames, B, so as to keep the bees down in them. They are movable and can be placed over the breeding and honey frames. A sheet of glass is placed over the honey frames, E, so as to let the bee-keeper see how the bees are working, and when the frames are filled. The slats, *a*, or a piece of cloth can be laid over the glass covering the honey frames, E, so as to keep the hive dark, and can be removed when it is desired to examine the hive. H is the hollowed strip by which the hive is ventilated.

Improvements on Patented Articles.

Editors Press:—Please decide a point for us. Suppose I hold a patent on some article, and some other parson invented and patented an improvement on my invention; now, does thare exist a law in connection with our patent office which would compel me to adopt or accept of his improvement? I say not; hut a person here, who is making use of several patanted machines every day and should know something about it, is of a different opinion. I leave you to decide for us. Rifle.

Napa City, July 28th, 1874.

[You are right. The holder of an original patent is no more bound to purchasa a patent for an improvement upon his invention than a person who owns a farm is bound to purchase tha farm adjoining him. An improver must base the value of his invention upon the advantages which it possesses independent of the original or former patent. Most of the patents issued from our patent office now-a-days are simply improvements; not one in five hundred being for the original discovery of a principle. —Eds. Press.]

Repoated Strike Near Reno.—A very rich strike was reported on Monday last in the Sierra Rose claim, in Ravine, near Reno. For some time they have been running in rock assaying from $60 to $80 per cent. in copper, till yesterday they struck rock perfectly studded with gold and silver. The Paymaster has run through an 8-foot ledge of very fine rock. Several other claims showing a fine prospect has given new life to Ravine district.

The Idaho mine, Nevada county, for the past four weeks, prodnced about $45,000. The Eureka mine, near by, is just paying expenses, including active explorations for pay-rock below the present workings.

Fruit Drying—A Revived Process.

Thora ara nnmerous patents on fruit dryers. The usual methnds are to construct chambers with shelves, or drawers, and either conduct hot air into tha chambers or apply tha heat of a furnsca so as to heat tha air in the ohambor. Tha first patent issned in tha United States for an apparatus for drying fruit in a chamber by a current of heated sir, and the fruit in motion, was to Francis H. Smith, Baltimore, Md. This patent was numbered 31566, and dated February 26th, 1861. Copying from tho Patent Reports tha invention is thus described, viz: "This invention is designed for drying brick, fruit or other articles. Tha tunnel or apparatus is divided into compartments, by means of sliding gates, which may be opened and tha cars pushed through anccessively when the drying process, in the trays upon the forward car, is completed." This was a horizontal chamber, and as the description says, the cars upon which the fruit was placed were pushed through tho chamber by hand.

Smith re-issned this patent three times, as follows: On the 30th Jnna, 1868; July 11th, 1871, and March 26th, 1872. The last re-issua is the patent now in forca. The claims of this patent are as follows:

First—A chamber through which a current of air is passed, and in which the articles to be dried are subjected to a progressive temperatura and dryness.

Second—The process of drying fruits and vegetablea hy subjecting them to a current of

AN OLD FRUIT-DRYING PROCESS.

air artificially warmed, in combination with a gradually increasing tamperature and incraasing dryness, etc.

Third—A drying chamher in which the operation is continuons in combination with increasing temperature and dryness, etc.

Fourth—A drying chamber in which the drying air is admitted at one end and escapes at the other, when such air passes through and around the substance to be dried, so as gradually to reduce its temperature and dryness, etc.

Among a number of other patents granted and issued since the date of Smith's original patent, is the patent which was issued to Charles Alden, of Newhurg, N. Y., No. 121569, and dated Decemher 5th, 1871, ten years after the date of Smith's original patent. This patent was re-issued on the 11th Novemher, 1873, with the following claim:

The withiu described process of maturing and preserving animal and vegetable substances in part through evaporation and in part through ohemical hinding of their organic moisture, hy exposing the same to a current of heated and humid air, increasing in humidity and decreasing in hest, as the evaporation proceeds, said current of air moving in the same direction with the articles to he treated, etc.

It will he seen that Smith's fourth claim covers "a drying chamher in which the heated air passes in at one end and out at the other," thus virtually preventing any subsequent improver from using such arrangemant. While Smith claims that the fruit shonld be snbjected to increasing temperature and dryness, Alden claims that it should be snbjected to a decreasing temperature and inoreasing moisture; thns, as he clsims, improving upon Smith's invention.

Now comes a party who publishes an article from the *Horticulturist*, published in Rochester, 1854, in which is described a drying apparatus which it is claimed was thrown npen to tha public over twenty years ago.

Tho acoompanying ont, with the following description which we copy from tha pnhlioation allnded to, will give our readers and accurate idea of the method and apparatus:

"It consists of a tall, npright shaft, *a b*, represented in the annexed section of the appatus, through which passes an endless chain, made of a nnmber of strong frames securely hinged together at their corners. This chain shonld he strong enongh tn bear several hundred pounds without breaking. At avery point it is furnished with a braced shelf, each consisting simply of a aqnara frame furnished with coarse twine netting—lika a sieve. This endless chain, with its series of sieves, runs over an angular wheel abova, another below, precisely like those of a common chain pnmp, but wide enough to receive the full hreadth of tha chain. Its motion is quite slow, descending from *a* to *b* on one sida, and rising on the nther, and is accurately regulated hy means of the pendulum, *d*, connected to tha notched wheel *e*, hy means of an escapement like that of a common clock, hnt made very strong. A strong and broad India rubber baud connects the axla of this wheel to tha drum, *e*, on which the chain rnns. As the chain is loaded with the drying fruit, and is therefore quite heavy, it must not, and indeed cannot ha snbjectad to the successive vibrations of tha clock work, these vibrations being broken and destroyed by the India rubber hand.

The fruit is dried by heated air. Tha fruit is spread npon tha sieve at the top, and descends as it is being dried."

If this statement oan be proven to he true in a court of law, Smith's patent will certainly be declared void bacanse his claims are too broad Still he wonld be entitled to a claim on his *horizontal* apparatus. The description abova given does not state how tha heated air is applied, so that we cannot tell whether the process is the same as the Alden process or not. Our readers may rest assured that no patent now in existence can prevent them irom drying fruit in the same manner that it was dried over twenty years sgo, and whenever a patent now in existence anconnters snch a precedent it must fall. As we said, Alden's process of "subjeoting tha frnit to a decreasing temperatnre and increasing moistura" may save it, although the apparatus which he uses is identical almost with that represented in our cut. The qnestion which now remains to he answered is, in what way was the onrrent of heated air applied in the old apparatns of twenty years ago?

Street Traffic of London.

It is estimated that one million persons enter London, the great commercial metropolis of the world, every business day of tha week, and leava again for their homes in the snhurbs or in the country, every evening. One million persons represant a number eqnal to the entire population of Californis, whose locomotion mnst thns be provided for to their places of business and hack, six times a week. No donbt a mnch larger portion of this numher make their way on foot than would be fonnd doing so in any American city of large extent; bnt a larger proportion also employ private vehicles and all moving over pavements than wonld be employed to accommodate the same amount of traffic in an American city. Twelve years ago it was estimated that something over 60,000 vehicles entered and departed from tha city every day. By reason of the more recent and general introdnction of cars—steam and horse—the nnmber of vehicles has not increased since that time in proportion to the amount of travel; hut still the nnmber of vehicles passing through the main thoroughfares is immense, and causes much inconvenience and delay hy street blocks and general crowding by constant passing and repassing. New expedients are constantly heing devised to relieve this inoreasing prassure of street traffic, among the more important of which ara new railways—generally steam railways conducted over the tops of honses or through nnderground tunnels—new police regulations, and new and wider streets. Yet the difficulty of solving the problem must be obvious from the mere statement of the case, and the constantly advancing ratio of increase in population and volume of business. The same problem has already become an almost insolnble conundrum as applied to the great commercial metropolis of the new world.

Water-Wheel.—Since the introdnction of Hyde's water-wheel power for driving sewing machines we notice that it is heing applied to various other machines for the same purpose; for instance, Hanly & Co. at their store on Market street, have one in use for rnnning their coffee mill.

The American sleeping and hotel cars are now coming into use in England. A late num- of *Engineering* speaks very flatteringly of a recent trial of Pullman cars on the Midland railway.

Colorado Mines.

A correspondent of the *Rocky Mountain Herald* writee as follows from Georgetown: We see freqnent mention made in the various jonrnals of the day, of the enormous wealth in this and that mining district, particnlarly of the vicinity of Gold Hill, bnt we look in vain for statemente of dividends in the moet glowing of those eensational articles beyond assays of pocket ssmples, whioh are calcnlated only to mislead the uninitiated. It certainly requires no argument to convince the pnblic that the continned prosperity of Colorado mnst depend largely upon its mines and reduction works. The great question, therefore, for consideration, is the qnality, qnantity and permanence of precions minerals which Colorado mines are able to produce, and not the production of minerals like tellnrinm, used only for a few chemical teets, n huudred poun ie of which wonld be an ample supply for the world for a year. It is now more than 10 yeers aince Colorado mines attracted the attention of capitalists and adventnrous spirite from abroad. Dnring that time large amonnts of capital have been sent here and expended, yielding in most cases no retnrns whatever. Representatione made have not been jnstified by eubsequent developments, or dividends. Thns much harm has been nnwittingly done to injnre our mining interests, and donbts engendered in the minds of those who would otherwise invest from their spare capital with a liberal hsnd. These donbts and misgivings mnet be removed by statements that can be snbstantiated of what mines hsve produced, and the profits realized in their working before we can hope for confidence in pnblished reporta concerning the fabulone wealth of onr minee.

Sensational artioles concerning fabulous discoveries, calcnlated to mislead the uninitiated, should be discountenanced by the press instead of enconraged as they now are, before we csn again hope for a full renewal of the confidence onr minee once enjoyed. We have mines enough that are suffioiently developed to guarantee their future, to write the most glowing articles abont without indulging in uucertaiutiee. That Colorado as a great mining couutry hee a brilliant fntnre before her, can be best appreciated when we consider the growing interest menifested in our mines by people from abroad who vieit ns for recreation and health. Had there not been miree here unexempled iu numbere and of surpassing richness, Colorado as a mining country wonld have sunk into utter insignificance, and all publio effort and interest wonld long sihce have been absudoned.

It is true, there hss been a failure in mining, as in other branches of business; but these failurea have been mainly owing to snch woeful mismansgement as ever entails failure and disaster in whetever bnsiness it appeare. In spite of mismanagement, misdirected effort and misrepresentation, our people snd mines have most gallsntly withstood and overcome these most prodigious obstacles, and to-day stand vindicated and triumphant everywhere, and are noticed and qnoted in New York, London and other great moneyed centers. No conntry need blnsh to own such mines as the Ceribon, Red Clond, Moose, Terrible, Dives, Pelican and Colorado Central. The Caribon, which sold for three millions of dollare to a Dutch company, as usnal mnst needs send over a Dutch mansger. In a very short time it beoame psinfnlly apparent that everything was going to the bad—when Mr. Moses Anchor, a Coloradan, who negotiated the sale abroed and retained a large intersst, was called to the general management. He soon bronght order ont of chaos, reduced the generul expeuses at the rate of $125,000 per annnm, and nt the eame time doubled the product of the mine. Now everything is lovely and Caribou stands high. Then there is the Terrible, sold by Mr. Fred. Clark, of Denver, to an English company, for $500,000, also, who must needs send over their English snperintendent. Tbe shares, which were £5, soon ran down to £1.10s. When Mr. Clark was called to the management, in lees than six months tbe stock stood at par again, and to-day the mine is considered about the best developed mine in Colorado. Thus it will be seen nt a glance what a difference there is between good and bad mauagement, of onr best mines. But the most important discovery in Colorado within the last two years, unquestionably, hes been the Colorado Central, which may safely be tsrmed the banner mine of the entire country. Prof. Stoelting, Territorial assayer, who sampled the produot of thie mine last year which was shipped to Friebnrg, Germany, says the amonnt or ore taken from thie mine dnring eleven montbe, commencing on January 31et. 1873, and rnnning to January, 1874, amounted to 247¼ tons, which contained 84,589 ouncee of eilver, or an average of 341¼ ounces of silver per ton of 2,000 pounds, being $109,119.84 in coin.

The selected or first-olass ore contained from 2,570 onnces to 4,225 ounces of eilver, and from 40 to 50 per cent. of lead to the ton. The second-olaes ore contained from 800 to 1,600 onncee of silver per ton, and the tbird-olass ore contained from 60 to 170 ounces of silver per ton. The oree in thie mine are the rarer qualities known, snch as brittle eilver, ruby silver, eilver glance, and grey copper contained in a matrix of galena, between well defined perpeudicular walls, in a crevice varying from 15 to 40 feet in width. For weeks together this mine netted as high ae $66.00 per man per day—for every person employed on and about the mine. Large qnantities of ore have been taken from this lode worth worth four dollars per pound, and ores have beeu sent from the mine to Germany that bronght $2.00 per pound by the ton. Professor Ches B. Richardson, in writing to the London *Mining Journal* concerning this lode, saye: It is evidently the bed of an ancient mountain stream, and promises well for the future, and may be said to be practically inexhaustable. It is in granite formation, in which none but true fissure veins are found We heve seen semples from thie mine so pnre in silver as to be susceptible of being pounded out almost like lead, into silver dollars. It has been worked entirely by lessees, and the owners receivsd over $20,000 royalty last year without contributing one single dollar, or giving nn honr'e labor, while the lessees, who started with about $4,000, realized between forty and fifty thoneand dollars' clesr profit, from eleven monthe' work, being abont ten hundred and fifty per cent. profit.

Now we contend that such statements as the above, based upon the results of the first year's labor, are the best showing ever mede in Colorado, all things considered, and fairly entitle the Colorado Central to be regarded the banner mine of the whole country.

Progress of Manufacturing Industries.

From varions eections of the State we have gratifying evidences that the people are making progress in the metter of establishing manufacturing enterprises. These are the more observable in the larger interior cities. In Sacramento emelting works have recently been erected, and although work has been somewhat retarded for a lack of water, a considerable quantity of ore brought from Utah has been rednced to bullion. But there is a demand now made in Sacramento for the erection of furnaces for smelting the iron ore which is claimed to have been discovered in the vicinity of that city. The Linooln (Placer county) coal has been well tested, and it is said can be utilized for this purpose. Sscramento certainly offere an inviting field for an industry of this character. The railroad compauy have large workshops there, and iron is the great ingredient in all the varions departments of mechanism connected with a railroad. In Stockton the manufacturers of agricultural implements have found it necessary to enlarge their worke, and we find it specially noted among the San Joaquin valley journals that the labor-saving machinery nsed in gathering the harvest of that valley hae been largely of home mauufacture. The Stockton Paper Co. are also making good progress. Several California journals are now printed upon the paper turned ont at their works, which bears a favorable comparison with the same class of paper turned out of Eastern mills. The tanneries and other leather manufacturing establishments in Stockton also show a wholesome growth. From small bsginnings they have arrived at the stage where regulsr exportetions now take plsce to China and Japan.

There is now every probability that a shipbuilding industry has been permanently entered upon at Vallejo. A tug-boat was lannched there last week, and another is in conrse of construction. The co-operative ship-carpenters are progressing satisfactorily with their schooner. And the ebip-building company are preparing for operatious on their 1,200-ton ship. In addition to which a boot and shoe company has been organized, which began business a few days ago. In Sonoma conty, one or two chair factories are in operation, with satisfactory resnlts. Cheese-making hae also assumed some importance in and aronnd Petalnma, and large quantitiee have been eold for the home market. Petaluma is also organizing a boot and shoe factory, with every proepect of snccess.

In the southern connties a eimilar disposition to embark in manufacturing enterprise is exhibited. Los Angeles already possesses a woolen-mill, and a project is on foot for organizing a company to manufacture paper. The oil-wells of San Fernando are in operation, and works for refining the oil have been erected. Passing up to the northern coast we find that Enreka, in Humboldt county, is moving to have a woolen-mill included in the industries of the place, nnd that at Crescent City, in Del Norte county, they are laying the foundation for a chsese factory. Added to the industries above mentioned are the number of wine cellars in process of construction all over the grape-growing counties—in Sonoma, Napa, Sacramento, Los Angeles, Len Mateo, etc. These wine cellare use large quantities of casks, and the day will come when they will be manufactured at home. Oue citizen of Sonoma county has commenced their mannfacture. He obtains his timber from Leke county, where it remains one year to season before being hauled into Sonoma and made up into staves for wine caske.—*Bulletin.*

Lincoln coal is now regularly on sale in Sacramento at $4.75 per ton. To the eye it is not prepossessing, being a dingy brown without luster. The lumpe are full of cracks and there is much that looks like bony or semi-slaty coal. But the burning provee that there is neither slate nor other impurity. The ash is free from slate and clinker. We saw it in use at the Sacramento water-works. The engineer reports it excellent fuel; only it burne up rather rapidly. At Ione, forty miles from Stockton, and at Lancha Plana, there are vast beds of similar coal, which the railway now under construction will bring to market next year. This cheap fuel cannot fail to affect the prosperity of the two cities mentioned, and it will be felt in San Francisco.

San Juan.

From a letter to the Eureka *Sentinel* from Rio La Plata, San Juan county, Colorado, we make the following extracts:

I came overland from Visalia, through Arizona, New Mexico and Southern Utah, arriving here on the first day of April—a nice winter's trip of 1,200 miles in the saddle. As usual on such occasions, we experienced the many incidental hsrdships of euch a trip. We were obliged to make 300 miles of new road, which now connects San Bernardino, St. George and Southern Nevada with Colorado on the sonth. Soon after arriving, our provieions became short and we were obliged to send a train to Fort Wingate. They were gone 28 days, 20 of which I, with several othere, eubsisted on grouse, and it took considerable ruetling to get them. We have formed a district and started in on the placers prospecting. The bar we are going to work ie about four milee long and oue and a helf in width, and shows to be very nice gravel to the bedrock, an average distance of 25 feet. It prospects from a half dozen colors to 20 cents to the pan. To work this we are compelled to bring a ditch to the har, the building of which we are engaged on with a force of 20 men. The capacity of the ditch will be 7,000 inches, and we expect to have water on for gravel sluicing in 40 days. All claims must worked in 20 days thereafter, or forfeited. I tbink when we have the water on, my claims will be worth $500 a day.

From appearances, I think thie one of the best mineral countries in North America. It will take time to develop it and money to set things a going in good shape, bnt when once fairly stsrted the district will be productive and one of importance. The ore is moetly rebsllions, though in some of the lodes the nstive silver is plainly seen and can be worked advantageously by milling process. The grand rnsh to this plsce is over. In common with all mining excitements hundreds of emigrants came here, mostly provided with scarcely a day's provisions, and having no knowledge of mining. They were forced to leave and gave the place a bad name. They said we had gobbled on the whole country that was of any value, but what we did take I think we have n right to, ns we were the first here.

There are six furnaces on the way that may get into operation this fall. I would not advise any one to come here nnless they can bring plenty of provisione, for it is a bad plece to get in and out of. The snow falle to a great depth, and waters on the different routes are generally high. The Indians at preeent are at peace with the whites, but they have killed several prospecting parties in the last few years, and cannot be relied on with any degree of security. They do not like to see us encroach on their grounds, and hail with great diseatisfaction the discovery of our new district.

The Oyster Beds at Richardson's Bay.—The oyster trade of California is fast increasing. Instead of the small, almost tasteless California oyster, which was about the only thing in the shape of a bivalve that we could get before the completion of the overland railroed, onr epicures can now revel in fat, plnmp, juicy Esstern transplanted Saddle Rock or Shrewsbury oysters. Morgen & Co., of San Francisco, have expended a large amount of money to make the traneplanting of oyetere on this coast a success. Shoalwater bay was first tried by this firm, but the oysters did not epawn in that locality. An effort was then made on the mud flats of Oakland for fonr or five years, bnt too much fresh water proved an obstacle. Vallejo was also tried, but without snccsss, and Richardson's bay is the only place yet found of convenieut access to the general market of the Stete that has proved satisfactory. In the beds at Richardson's bay—one at Kashow'e island and the other at Reed ranch—there is at preeent time about $20,000 worth of oysters. A force of dredgers is constantly at the beds to snpply the market, and a trip to the locality would prove quite interesting and entertaining. The agent of Morgan & Co. informe us that the Eastern transplanted Saddle Rock or Shrewsbnry grows more on an average in California in six months than in the Esstern States in two years.—*San Rafael Herald, July 30th.*

Work at the Railroad Shops.—At the railroad machine shop six 3,000-gallon tenders, with strong iron frames, are being constructed for use by the locomotives running between Wadsworth and Winnemucca, the object being to dispense with the neceseity for hanling the water cars which have been run heretofore to snpply the engines. The frames of these tenders are 22 feet in length, and the tanke will hold 1,500 gallons of water more than ordinary tenders. In the boiler-shop there is much work being done. Two splendidly-built boilers for the steamer "Chin-du-Wan" are receiving the finishing touchee. The steamer's old boilers had but 1,100 feet of heating surface, while these have two thousand, but the difference in cost will be abont made up in one seaeon by the saving of fuel. A new shaft is also being made for the "Cbin-du-Wan." Two immense boilers for the steamer "Chrysopolis" are well advanced. They are each 29 feet long, with a diameter of shell of 11⅛ feet, and 35 tons weight. A number of men are employed in the boiler-shop constructiug water-pipe for railroad use near Los Angeles, and it will be a pretty big job, three miles of three-inch pipe. The casting of car wheels hes been resnmed at the foundry, and at present 12 are turned out daily, but the number will soon be increased. —*Sacramento Union, July 31st.*

The New Crown Point Hoisting Machinery

At 11 o'clock thie forenoon a temporary steam pipe from the old boiler was attsched to the new hoisting engine of the Crown Point works for the purpose of a preliminary test or trial. The steam being turned on, the whole great mass moved and worked from the very start with the ntmost precision and perfection. Not a single miecslculation had been made, each bolt and other detail of the mechinery filling its proper function without the necessity of a chauge of a single piece of the whole. This hoisting mechinery, in some respects at least, is without a parallel, and when considered as a whole, ie simply ponderous. The machinery is driven by two hoistiug engines which are of the liuk motion, built after the fashion of a common locomotive engine, so that when the steam is tnrned on they start from any point of revolution. The cylinders are each 20 inches in diameter, with a 42-inch stroke, giving a combined power of 300 horses, each engiue weighing 22½ tone, and the bed plates and boxes npon which they rest weighing 17½ tons. To these engines is attached two fly wheele 14 feet in diameter, and each weighing 14,000 pounds. The driving or spur wheel of these engines is 21 feet in diametsr, with a 19-inch face, the coge having a 6-inch pitch, and weighs 28 tone. Attached directly to this driving wheel is a ponderous hoisting reel, 21 feet 6 inches in diameter, with 6 foot face covered with heavy cast iron plates, with a spiral groove encircling it in which a heevy steel cable, two inches in diameter, winds like a screw, each coil of the rope having its own separate groove, thus avoiding all friction or chafing of the rope, and greatly adding to its wear and safety.

It takee four and a half revolutions of the engines to make one turn of this drum, which winds 68 feet of rope at a tnrn, and is calcnlated to hoist 12 tons of ore at a load. The real sheft is 13 inches in diameter, and 14 feet long, which, with the reel alone, weighe 56 tons. This tremendous weight of machinery is built upon 1,200 perch of solid masonry, there being 800 cubic feet alone in the pillow blocks and engine beds. The anchor bolts are 17 feet in length, and the whole built in the most solid and perfect manner. The engine will be supplied with steam by 4 54-inch tubular boilers, each 16 feet in length. This ponderous piece of maobinery wae designed and its erection snperintended by I. F. Thompeon, the noted engineer and machinist, assisted by Mr. Ivy Fulton, chief engineer of the works, and reflects great credit npon both. It is designed to work the mine to the depth of 3,200 feet, which it will no doubt do with perfect esse. The connection between the new boilers and the engines are not quite finished yet, bnt will be by the first day of August, when it is expected to resume hoistiug ore from the mine, with an opportunity for bigger and better work than has ever been done heretofore.—*News.*

The anthracite coal mine recently discovered by Olympians, ie about 20 miles eontheast of the summit of Monnt Ramier, and one mile south of the south fork of the Cowlitz river. The seam is 11 feet thick, well defined along the margin of Coal creek for more than three-fourths of a mile, with a stratum of elate 8 inches tbick overlying the coal, and over this stratum solid basaltic rock, averaging over 100 ft. thick, and still over thie rock a mountain of earth and rock. The company having now returned with full confidence that their object had been gsined, their claim notice of 320 acres of land recorded, and having exhibited about 100 pounds of coal as specimens, feel confident of success in obtaining the requisite amount to pay the expenses for a full and satisfactory development of the mine. In furtherance of this object the company therefore offer to any individual or compauy an equal undivided interest in the whole mine, provided such individual or company furnish the requisite means for paying the expenses of further development, wbich shall not exceed $1,000; it being understood, however, that the parties having enbscribed originally toward tbe expensee for prospecting shall be first considered.

Started up on Trial.—The new hoisting machinery of the Crown Point mine wae started up yesterdey for the first time. A steam-pipe from the old boilers was connected with the new engine, and the machinery was pnt in motion to eee if it was all in working order. It moved on beautifully, the ponderons wheels revolving without a clash or jar. As Snperintendeut Sam Jonee remarked: "It got up and walked off like a thiug of life." The machinery is not yet connected with the hoisting apparatue. It was allowed to run all day yesterday, that the great gudgeons and boxee might be worn smooth. No ore is being hoisted from the mine, nor will any be taken out nntil all the machinery is ready to start np and continue in constant operation.—*Enterprise, 29th*

The Sarah Rose.—We have before ns th result of an assay of rock taken from th mine, Peavine district, which reads as follows

Gold, per ton	$1,384
Silver, "	3
Total	$ 1,385

We have ouly to say it is most too good tce considered average rock. If Captain Grifh has a mine of any considerable magnitnde at will pay half as well by mill process, he ont at once to announce himself a Repnblican n-didate for the United States Senate.— *no Crescent.*

DEWEY & CO.,
American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent.

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signiug.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washngton.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 224 Sansome street, S. F.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Government fees, practical hints, etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

New Inventions!

Of real merit, if brought plainly before the public when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the PRESS. Superior Engravings Made, at reasonable rates, by artists in this office. hp-tf

THE NEW WINCHESTER
REPEATING RIFLE,
(Model of 1873.)
San Francisco Agency
NO. 108 BATTERY STREET, SAN FRANCISCO.

The Winchester Repeating Arms Company, of New Haven, Coan., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Cartridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency.

Ayer's Hair Vigor
—FOR—
RESTORING GRAY HAIR
TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, cares, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus harshy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft lustre and richness of tone it imparts.

points. The new pump station at the 1,000-ft. level, is completed, and another has been commenced at the 750-ft. station.

Woonville.—Opening out the mine for the extraction of ore north of the shaft, is making good progress. The body of ore recently developed in the upraise, 300 feet south of the shaft is widening out.

Buckeye.—The north drift at the third station level is in 152 ft. Prospecting on the first station level is still vigorously prosecuted.

Knickerbocker.—Opening the 600-ft. station is making fair progrees.

Crown Point Ravine.—The main south drift on the 300-ft. level is being rapidly advanced, the full face of the drift in solid quartz and low grade ore, with occasional spots of good pay.

Yellow Jacket.—Driving the main east drift on the 1,740-ft. level, for the purpose of crosscutting and prospecting the ore vein at that point, is making good headway.

Caledonia.—The main shaft is down 28 ft. below the 900-ft. level. Sinking the winze below the 700-ft. level is making good progrees.

Daney—Still driving the main west drift ahead, the face being quite soft, with some fine streaks of quartz asseying from $20 to 25 per ton.

Succor.—Prospecting and extracting ore from the mill shaft in the cañon are going ahead as usual.

Occidental.—A crosscut has been started to prospect the ore vein at a point 88 ft. below the tunnel level.

Sutro.—The main west tunnel is still pushed vigorously ahead, the face in fair blasting ground.

Baltimore Consolidated. — Sinking the shaft is making the usual good progress, the rock in the bottom working quite favorably.

Union Consolidated.—Still driving the north drift on the 1,300-ft. level of the Ophir, following the west wall of the ledge, cutting occasional bunches of quartz with ore indications.

Lady Bryan.—Sinking the main shaft is making good progrese.

Senator.—Driving the main east drift to intercept and cross-cut the ore vein, is making steady progrese.

American Flat.—Driving the main southwest drift from the 750-ft. station of the Baltimore Consolidated is making good progrese.

Bullion.—Driving the main drift on the 1,700 ft. level is making steady progress, following the west wall of the ledge.

Arizona.

Yavapai County.—*Miner*, July 24: The news from Walker district is that Lynx creek is now filled with water from heavy rains at the head of the creek. In consequence of this supply, Lovejoy & Co. are working away in their hydraulic claims, and all who have sluicing claims are doing the same thing. The waterwheels, near the head of the creek, are running night and day, driving arrastrae.

It is said that the owners of the Tiger mine, in Bradshaw, are about to grant another extension of time to the gentlemen who are endeavoring to sell their mine for them.

While going the rounds this forenoon, Mr. L. Bashford showed me over $2,000 in nice gold, which cum he has recently bought. It is not long since he shipped fourteen pounds of gold to California. The best looking gold in the lot was that from Lynx creek.

Smith's mill, near Wickenburg; the Vesuvine company, in Walnut Grove district, and many others are taking out considerable gold.

Mohave County.—At latest advices from Mineral Park, the shaft on the Keystone mine was down 160 ft., at which depth the ore was as rich as the richest Tiger ore.

Colorado.

Clear Creek County.—*Review*, July 25: Wm. Newman has developed a fine vein of ore in the Atlantic that yields upwards of 850 ounces of silver to the ton.

C. J. Goss is working a lode on Brown mountain—a new development—from which he has already had two mill-runs of first-class ore, the first being 610 ounces per ton, the second 741 ounces.

We hear of a splendid discovery recently made in Geneva district. At a depth of six feet the lode carries a solid vein of bismuth silver ore that runs $4,535 of silver per ton.

The Diamond tunnel is now in a distance of 630 feet. Lode No. 4, cut about the 1st of May, shows at the crossing a small streak of fine galena mineral, carrying a heavy per cent. of brittle silver, a specimen of which assayed $2,181.

San Juan.—A letter to the *Miner*, bearing date July 2, says that at a depth of 12 feet in the Evergreen mine there is a strong vein of mineral that assays 396 ounces silver per ton.

Montana.

Vipond and Trapper Ores'—*New Northwest*, July 25: During the past week or two a considerable quantity of ore has been purchased and shipped from the Vipond and Trapper districts. A good deal of this rock assays up to $200 per ton, and is worth 40 to 50 per cent. of assay on the dump. Arrangements are being made to take out much larger quantities of ore hereafter.

The Jefferson river mines are attracting many loose footed miners. During the past week or two dozens of prospectors with pack outfits have wended their way toward the rising sun and the new El Dorado.

The Kelley & Pemberton ground at Georgetown paid $900 on the second week's run, and a very rich clean-up had been anticipated this week but for the breaking of the ditch.

A New Phase of Irrigation.

In the valleys where irrigation has been most extensively introduced, a noticeable change has occurred in the atmosphere; greatly modifying the discomforts of the heated term in those localities. The oppressive heat of midsummer in some of the most favored valleys in the State has heretofore been an objection in the minds of many to locating there; but by a liberal supply of water in these localities, and by the growth of grasses, fruit trees and other vegetation, that this irrigation has promoted, the summer atmosphere has become much more bearable. In Kern county, especially, where probably more has been done in the matter of irrigation than in any other portion of the State, this climatic change is quite perceptible. Still more extensive schemes of irrigation are about to be inaugurated there; and with the probable increased improvement in the atmosphere which this will produce, will add greatly to the attractions of San Joaquin valley. The probability is that the irrigating enterprises of California will result in something more permanent than an increase of the crops to which it is applied. For the moisture that is thus artificially brought to these dry, languishing places, encourages permanent vegetation there; and this vegetation in its turn promotes moisture and tempers the severity of the heat; thereby reducing the necessity of irrigation, and making these fruitful regions far more desirable as permanent homes.

A Kern county exchange credits the growing alfalfa crop with aiding materially in modifying the heat and dryness of former summers. The increased acreage given to this crop in Kern county is quite extensive, and the breezes that come across these rich, green, almost matted fields, if they are not equal in their fragrance to those that come from "Araby the blest," are good enough for "all practical purposes;" and if those who breathe this alfalfan breeze do not go into poetic ecstasies at its approach, they will at least feel inclined to take off their hats to it respectfully, and even thankfully.

That these climatic changes are being effected by irrigation, satisfactory evidence proves, and science affords ample illustration of the mode by which it is done; but, while we are considering the climatic benefits derived from a limited system of irrigation, in an extremely dry region, we would call the attention of those living in places surrounded with a damp atmosphere, to the danger of excessive irrigation. San Franciscans, especially, would do well to consider whether their profuse irrigation is not really injurious to the health of the city. When, to the cold fog which hangs about our dwellings morning and evening, a copious watering is added to everything surrounding the house, a condition of the atmosphere is produced which does not offer a safe retreat to persons afflicted with pulmonary diseases. It is believed that diseases of this class are on the increase in San Francisco; and it is remarked that while some are coming here to escape consumption, others are leaving for the same prudential reasons.

This artificial dampness is undoubtedly even worse than that which is caused by excessive rain; and if people possessing weak, or partially diseased lungs, can not safely remain in an atmosphere naturally damp and chilly, it is, we think, at a still greater risk that they pass their time in neighborhoods where the bare earth, the grass, shrubs, walks and streets even, are very day, and in many cases twice a day, drenched with cold water that has not been properly prepared for this purpose by passing through the air that surrounds us. A delicate person would probably incur less risk in going abroad on a regular damp day than on a dry one, when the warm, dusty streets and sidewalks are interspersed with crossings and other spaces that are as wet as they can be made, and that, too, with the coldest of water.

Do we not see more water about our houses than accords with good health or even with comfort? While our friends in other portions of the State are panting and languishing during midday, and in the morning and evening hours are tempted into out-door strolling, and are justified in the use of any means for "cooling off," we are only comfortably warm at midday; rather preferring the sunny side of the street; while the semi-daily fogs drive us indoors morning and evening, throwing a wet blanket over all out-door enjoyments. In every house in the city, no matter what the condition of its inmates may be as to comfort and healthfulness, to be drenched, with all its surroundings, just for "the fashion of the thing," or because California generally is to be recognized as an exceedingly dry climate? Those who are concerned for their own health or that of their families, and those also who are sensitive about the reputation of California for healthfulness, would do well to give a thought to this matter.

The present high price of quicksilver furnishes a strong inducement for prospecting for this metal, and it is to be hoped that the sources of supply will continue to multiply, and with increasing production, until the "corner," which we believe exists to make this article a monopoly, has been effectually broken. Men who own quicksilver mines should hold on to them, or sell only to such men as will work them.

Tecumseh Gold, Silver and Copper Mining company has levied an assessment of 25 cents per share, delinquent September 5th.

General News.

Another Reservoir Break.—The great reservoir supplying the city of Trenton (N. J.) with water, suddenly gave way on Monday last, sending down an immense volume of water through Pennington and Railroad avennes, in that city, and thence on to the Delaware. It inundated all the houses in the neighborhood, and compelled the inhabitants to flee for their lives. Almost miraculously no lives were lost; but an immense destruction of property was occasioned. It is said that the break had been observed for some days, and workmen were actually engaged in repairing it when the whole embankment, 30 feet high and 25 broad, suddenly gave way before the pressure of water. These frequent giving way of reservoirs of late is certainly a matter requiring the most rigid scrutiny, both into the causes of the past and the possibilities of the future.

Of late years frequent attempts have been made to replace stearic acid by some cheaper product, and paraffin, composition, Belmontine and other kinds of candles have been produced; although largely used they will never supersede the undoubtedly finer stearine candles. A few years ago the manufacture of candles of bleached ozokerit commenced, and this ozokerit promises to play an important part in future in Austrian industry. Being much cheaper than wax, and equally well adapted for the manufacture of candles, flowers, figures, paper, etc., it is also useful for cosmetical, technical and pharmaceutical purposes, and employed in many places throughout Austria in preference to bees-wax. The refined or purified ozokerit is sold under the name of *ceresin*.

The agitated elements from the north, south, east, west, the valleys and the mountains, reports of thunder and lightning displays, attended with cloud-burst, wind-storms, and deluges of rain still continue to reach us. Arizona has had these visitations. They have been witnessed in San Bernardino, Inyo and other counties where but little rain falls even during the winter season. At San Diego, there was, on the 29th ult., a grand electrical exhibition, such as is seldom witnessed in this State. Peal after peal of thunder rolled along, and incessant flashes of forked lightning lit up all the eastern and northeastern heavens. This display was continued for nearly three hours, the storm gradually passing around to the north and northwest.

Postal Changes for the Pacific Coast.—The following postal changes have been ordered for the Pacific Coast, during the past week: Postmasters appointed—Joseph H. Miller, at Mariposa, Mariposa county, California. William H. Cullmer, at Sandy, Salt Lake county, Utah. Henry Wickenburg, at Wickenburg, Yavapai county, Arizona.

The San Joaquin River.—The Stockton *Independent* states that persons familiar with the San Joaquin river entertain the belief that, at the rate the water is falling, the stream, in the course of two weeks, at the farthest, will be navigable only by boats of the lightest draught, if navigable at all.

Singular Case of Death.—The Santa Cruz *Enterprise* says that Conrad Stsndet, the man who died so suddenly at Aptos recently, is said to have died of overjoy, brought on by the exceedingly generous gift by Claus Spreckles to the deceased of fifty acres of land.

The Trial of Vasquez.—The notorious outlaw, has been transferred from Monterey to Santa Clara county, for trial. The most persistent efforts will, no doubt, be made to cheat justice of her due in his case, as in many similar ones of late years.

Struck by Lightning.—During one of the storms two weeks ago, Melvina, daughter of D. E. Isbell, was struck by lightning, at the ranch of her father, on Reese river. She was prostrated by the stroke and severely injured, but will recover.

The Sixth Senatorial District Agricultural Association of the State of California propose to hold a district agricultural fair at Salinas City, Watsonville, Holister, or Santa Cruz, sometime in the month of October next.

Killed by Coal Oil.—Another victim of the business of kindling fires with coal oil is Miss Emma Smith, of Helena, Montana, who was so badly burned on July 10th that she died on the 12th.

State Prison Outbreak Frustrated.—The plans for a general outbreak from the State Prison, Nev., to have taken place several weeks since, were exposed by one of the prisoners.

Insane from Beecher-Tilton. — A man named Wm. Rameey, near the Azues, Los Angelos, has reasoned himself into a fit of insanity over the Beecher-Tilton scandal.

The first annual fair of the Bay District Fair Ground Association is to commence on the 7th and end on the 12th of September, 1874, at San Francisco, Cal.

The agents of the bondholders of the California and Oregon railroad are examining into its affairs.

The Virginia *Chronicle* says men are badly needed in Empire City to take wood ont of the Carson river.

Rich placer diggings, it is reported, have recently been discovered a short distance to the west of Carson city.

Carson, Nevada, wants a Vigilance Committee.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Aug. 4th, 1874.

For Week Ending July 21st, 1874.*

Paving Blocks.—Philip Zsdig, S. F., Cal.

Railway Car Axle.—Henry H. Rhodes, S. F., Cal.

Treating Fats to Separate the Stearine from the Oleine.—Francis J. Kraft, S. F. Cal.

Hatchet.—Robert H. Morrison, S. F., Cal.

Gear-Cutting Machine.—John A. Peer, S. F., Cal.

Railroad Switch.—Bourgin. pierre, Oakland, Cal.

Closing Gas Retorts.—James R. Smedberg, S. F., Cal.

Gas-Purifiers.—James R. Smedberg, S. F., Cal.

Trade-Mark.

For Powder.—Joseph W. Willsrd, S. F., Cal.

*This patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

Foreign Patents.

British Patents for Pacific Coast Inventors

Following is a list of inventions patented or protected by Provisional Specifications in England, by inventors in the Pacific States and Territories, from January 1st to June 30th, 1874:

Dental Filling.—Charles E. Blake, S. F., Cal.

Pump and Engine.—William D. Hooker, S. F., Cal.

Filter.—P. Huerne, S. F., Cal.

Rock Drilling.—W. W. Dunn, S. F., Cal.

Breech-Loading Fire-Arm.—Alfred Swingle and Frank A. Huntington, S. F., Cal.

Foon from Milk.—B. Smith, S. F., Cal.

Air Engine.—Wm Manson, S. F., Cal.

Gear-Cutting Machine.—John A. Peer, S. F., Cal.

Canadian Patents for Pacific Coast Inventors.

Following is a list of inventions patented in Canada by inventors in the Pacific Coast States and Territories, from January 1st to June 30th, 1874:

Water Filter.—Prosper Huerne, S. F., Cal.

Improvements in Dentistry and Improved Metallic Foil.—Charles E. Blake, S. F., Cal.

Fastening Seams.—Jacob W. Davis, S. F., Cal.

Breech-Loading Fire-Arm.—Alfred Swingle and Frank A. Huntington, S. F., Cal.

Window-Fastening.—W. A. Hawthorne and E. E. Scott, Cereon City, Nevada.

Atmospheric Power Hammer.—Wm. Manson, S. F., Cal.

Tripartite Tie Link for Chains.—Wm. Quinlan, Santa Clara Co., Cal.

Prosperous Signs.—The *Enterprise* speaks hopefully of the prospects in Western Nevada, as follows: The great hoisting works, so famous along the line of the Comstock, continue to be extended until American Flat and Silver City bid fair to be as densely populated as Virginia and Gold Hill. Houses are going up in all directions in this and a portion of Lyon county, and improvements are being made all along the line of the railroad from the City of Carson, which has undergone greater improvement this last year than ever before. Brick buildings for stores on the main street and substantial frame cottages are being erected with great rapidity. That town is outgrowing its original dimensions, and an "addition" to it is to be made on the northeast. The farms of Ormeby county are being cultivated in excellent style, and everything bears the unmistakable sign of thrift. Within an area of two miles of the State House more than 18,000 forest trees and a considerable number of fruit trees have been planted this season. Up in Carson valley, one of the finest of its size in the world, the same thrift is everywhere visible. Farms may there be seen which are unsurpassed anywhere. The successful mining on the Comstock is of course the cause of this general prosperity. It furnishes profitable markets for the farmers, and diffuses more general prosperity among the people of the western portion of the State that exists, perhaps, among the same number of people elsewhere on the Pacific slope.

An institution destined to survive the Vienna Exhibition, and at the same time to serve as a memorial of that event, is the Austrian Athenæum, an establishment founded in the interest and for the instruction of mechanics and working men, and constructed after the plan of the Conservatoire des Arts et Métiers in Paris. Large numbers of articles left by exhibitors at the Exposition have been transported thither, together with a quantity of models and other instructive apparatus, and a library of 3,412 volumes.

Rules and Regulations of the Ninth Industrial Exhibition, Mechanics' Institute, San Francisco, 1874.

1. The Pavilion will be open for the reception of goods on Monday, August 10th. The exhibition will be open to the public on Tuesday, August 18th, at 11 o'clock, A. M.

2. Applications for space must be made on or before July 20th, stating character of exhibit, amount and kind of space required—wall, table or floor. Blanks will be furnished for this purpose, and a clerk will be in attendance at the Library of the Mechanics' Institute, every day from 12 to 1, and 7 to 10 P. M.

3. All persons presenting articles for exhibition must have them registered by the Receiving Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn, at the close of the exhibition.

4. The name of every article must be attached by the exhibitor to it, and filed with the Board of Managers.

5. In case of any misunderstanding, application may be made to the Manager of the day, who will at all times be in attendance.

6. Articles intended for sale will be labeled accordingly, but cannot be removed until the close of the exhibition, except by written permission of the Managers.

7. Steam power will be provided, so that machinery of all kinds may be seen in actual operation, and every facility possible will be given to exhibit working machinery to the best advantage.

8. Perishable articles will be received, or may be removed at any time during the exhibition, with the consent of the Managers.

9. The most effectual means will be taken, through the agency of the Police and otherwise, to guard and protect the property on exhibition; and it will be the purpose of the Managers that all articles shall be returned to the owners without loss or injury. Still, all articles deposited will be at the RISK OF THE OWNERS.

10. Articles intended for exhibition must be entered and placed on exhibition on or before Friday, August 21st.

11. The Managers are desirous that articles should be presented early. Those from abroad, intended for exhibition, should be properly packed, and if not consigned to exhibitor's agent, must be marked: "MANAGERS OF NINTH INDUSTRIAL EXHIBITION, SAN FRANCISCO-CAL." Articles from foreign countries should be accompanied with a certificate from the American Consul, in order that, upon their arrival, the proper course may be taken to have duties remitted. All articles thus received, arriving too early, will be stored free of cost to the exhibitor, and the Managers will have them duly placed in proper position for exhibition. No freight charges will be paid by the Managers; but exhibitors are notified that arrangements are being made with various transportation companies to repay freight charges on evidence of return of goods exhibited.

Information will be furnished on addressing MANAGERS OF NINTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL.

GENERAL MERCHANDISE.

WEDNESDAY M., August 5, 1874.

Bags and Bagging are still in good demand, and the transactions are large. Coffees are weaker. Coal Oils are shading off. Sugars are firm at the new rates.

METALS.

WEDNESDAY M., August 5, 1874.

Reports from London, New York, etc., show a stringency in stocks of Quicksilver on hand, and the price has been advanced throughout the world. Here the present quotation is $1.45 ℔ lb. with an intimation as to where the rise will stop, if aver. The yield of the New Almaden is steadily decreasing and it is reported that the works are to be temporarily shut down. High rates for Quicksilver mean a large diminution in profits for all gold and silver mines and a possible suspension of work on very low grade ores.

Designing ana Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by landing their influence and encouraging favors. We intend to send none but worthy men.

L. P. MCCARTY—General Agent.
W. H. BATTENBERG—California.
CHAS. W. OTIS—Contra Costa County.
CHAS. T. BELL—Alameda, Santa Clara and Santa Cruz Counties.

Removal.

July 13th, 1874, the business office of this Journal was removed just one block east of our former location, to No. 224 Sansome Street, southeast corner of California, over the Bank of British Columbia, where we have secured large and elegant quarters. This removal is made in consequence of the sale of the building which we formerly occupied, to parties who will proceed immediately to demolish the present structure and erect a new and magnificent block in its place.

NATIONAL FORMERLY FRIEDLANDER'S BUILDING.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

ONE of our most valuad exchanges is the PACIFIC RURAL PRESS, published by Dewey & Co., San Francisco California. Every number contains a vast amount of general newe from the far west, besides much valuable information in the way of Grange newe.—*The Farmer's Friend, Mechanicsburg, Pa.*

To Mining Secretaries.

An amendment to Section 338 of tha California Code, taking effect **July 1st, 1874,** provides that in addition to the regular publication of tha assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in tha following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in tha MINING AND SCIENTIFIC PRESS will be furnished with copias of aeeeesment notices printed on olipe suitahla for sarving personal notice under thie law at short notice.

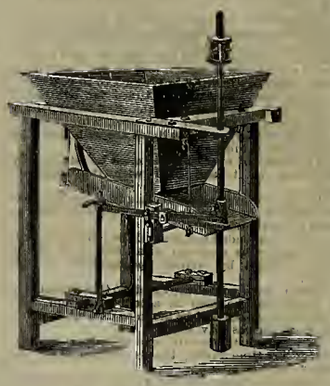
Machinery.

Tulloch's Automatic Ore Feeder.



At the request of Mr. Jas. Tulloch, we have carefully examined his patent Ore Feeder for Quartz Mills, now on exhibition in this city at the Pacific Foundry, and in view of its simplicity of construction, directness of action, durability and compactness, as well as its small weight and the low price at which they are held by the patentee, so as to place them within reach of all mill owners, are free to state our unqualified opinion that we regard it superior to any Ore Feeder of which we have any knowledge in actual work. We are confirmed in this opinion by the severe tests to which it has been put, doing its work thoroughly well on ores of all kinds. We find the delivery to the mortars of the ore-stuff, whether dry, damp or wet, to be entirely uniform and regular, and that even slimes and slush can be worked in them under perfect control.

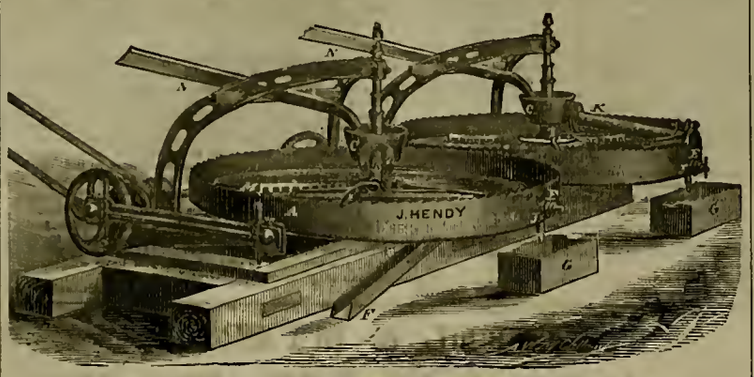
OVER $3,500 PER MONTH SAVED

BY THE USE OF

HENDY'S IMPROVED CONCENTRATOR



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1874.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and buddles formerly in use. O. C. HEWITT, Supt.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottome, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely sheorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

DEWEY & CO.,

Publishsrs and Patsnt Agents.

Office of the MINING AND SCIENTIFIC PRESS and PACIFIO RURAL PRESS, No. 224 Sansome, Cor. of California Street. July 16, 1874.

bptf

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly onlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid hy ns for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled hy that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Mannfacturers, Professional Men, and Progressive and Industrial Students shonld patronize its columns of fresh and valnable information.

ining Engineers, Snnerintendents, Metallurgists, Mine Owners and Mine Workers throughont the world should profit by its illnstrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 224 Sansome street, S. F.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIO RURAL PRESS, and the ILLUSTRATED PRESS. Experienced canvassers preferred. Good men can make large wages, besides learning much and improving their talents.

Hints to be Remembered.

A note dated on Snnday is void.

A note ohtained hy frand, or even from one intoxicated, can not he collected.

If a note he stolen it does not release the maker—he mnst pay it.

An indorser of a note is exempt from liability, if not served with notice of its dishonor within twenty-four hours of its non-payment.

A note hy a minor is void.

Notes hear interest only when so stated.

Principals are responsible for their agents.

Each individnal in partnership is responsible for the whole amonnt of the debts of the firm.

Ignorance of the law excuses no one.

It is a frand to conceal a frand.

The law compels no one to do impossibilities.

An agreement without consideration is void.

Signatures in lead pencil are good in law.

A receipt for money is not legally conclusive.

The acts of one partner hind all the others.

Contracts made on Sunday can not he enforced.

A contract made with a minor is void.

A contract made with a lunatic is void.

PLAINFIELD, July 4th, 1874.

MESSRS. DEWEY & Co.—*Dear Sirs:* I acknowledge receipt of yours of 2d inst., inclosing my Letters Patent. I thank yon for the interest yon have taken in obtaining the same. Yours truly, M. W. OCON.

A COMPLIMENT.

PLAINSBURG, MERCED Co., CAL., June 22, 1874.

DEWEY & Co.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which yon have displayed in procuring my patent.

Although yon were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent yon as such. Very truly yonrs,

H. W. RUCKER, M. D.

THE SCIENTIFIC PRESS.—This valnable jonrnal entered upon the seventeenth year of its pnblication on the 4th of July. The steady advance in charscter, that every reader has noticed in the paper, renders it unnecessary to make any splnrge of improvement, and the publishers simply content themselves with the aunouncement that they will continue to make their paper as interesting as possible. That it is interesting to a large class of readers, the wide circulation and extensive influence of the PRESS, is sufficient evidence.—*Placer Argus.*

TRUCKEE, CAL., Jnly 10, 1874.

MESSRS. DEWEY & Co.—*Gentlemen:* My patent is just received, and is entirely satisfactory. Permit me to tender you my sincerest thanks for the care and attention, the promptness and interest you have displayed in managing my affairs. Gratefnlly yours,

C. F. MCGLASHAN.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatns, (revolving screen) delivering four sizes of ore to four rows of sieves, each; row independent of the other, and each having sieves, each row concentrating according to specific gravity; the special size automatically fed into it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter, galena and silver sulphurets from pyrites, haryta and qnartz, and pyrites from quartz.

Added to a battery of stamps this machins constitutes a full system of ore concentration, sufficient in most cases for the requirement of western mines, with a capacity of 12 or 15 tons per 24 honrs.

For particulars apply to,

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 15, 1874.

VOLUME XXIX Number 7.

Improved Road and Farm Locomotive.

The traction engine and train of wagons we illnstrate are the mannfacture of Messrs. Aveling & Porter, of Rochester, England, and were awarded the prize medals for progress and merit at tha Vienna Exposition of last year. The steam road rollers, built hy the same firm, were also awarded similar medals for progress and merit. The engraving represents a scene in a quarry, with the locomotive hanling blocks of stona in heavy wagons. Thsra are many places on this coast whera this apparatns conld ba introdnced with great henefit.

Since the very important trials of road engines at Paris, in 1867, and Wolverhampton, England, in 1871, tbeir value as snbstitntes for animal power, as feeders for railroads, as pioneers in new districts, and eventnally as snperseders of horse-drawn portsble engines, is becoming genarally and intelligently recognized. The nnmher of these engines hnilt np to this tima, hy Messrs. Aveling & Porter, exceeds one thonsand, and the trade is rapidly developing.

The economy in the cost of removal of heavy material in certain localities, is certainly very great, and the manufactnrers claim that the cost does not exceed ona-tbird that of doing the same work by horse power. The variety of nses to which tha engina can be applied, snch as thresbing grain, hanling farm produce, plowing by direct traction, pnmping, sswing, etc., materially add to its nsefulness, and maka it applicable for different kinds of work all the year ronnd.

The engines are very strongly and simply made, and manifest the greatest care in thsir construction. The facility with which they are guided and driven, hoth operations heing performed hy the sama man, exhihits mnch progress and ingannity. Tbe simplicity of the machines enables them, it is claimed, to hs worked at a small cost for wear and tear, and the lishility to accident from hreakaga is redneed to a minimnm. A large amonnt of hoiler room is givsn to aach engine, and the fnrnsces are constructed to hnrn aither wood or coal. Their economy in this respact is stated to he very great. At the Wolverbampton trials an Aveling 10-horse engine, fitted with a single elida and ordinary link motion, indicated 35-horse power with a consnmption of three and one-fifth pounds of coal per horse-powar per honr.

The following testimony of Mr. D. Brennsn, the President of tha Talford Pavement company, of Orange, N. J., who has two of these road locomotives, is givsn, as showing their vslue for hanling pnrposes: "We have nsed, for hauling stone, one of tbe Aveling & Porter six-horse power traction angines, pnrchssed of yon, and with very satisfactory results. We hanled with this angine (with engineer and one assistant) abont 75 tons per day, a distsnce of a mile and a qnarter, over a new road. Thera is no donht that even better results can he obtained at longer distances, whera tha delays of loading and nnloading ara not so freqnent, especially if on a good road. Wa consider that tbese engines will do hanling for one-third the cost of tha same work done by horses, at $5 per day for team and driver, hauling ona and a half tons at a load; and we ara making preparations for a more extensive nse of them in tbe futnra."

Mr. W. O. Oastler, 43 Exchsnge Place, New York city, is Messrs. Aveling & Porter's agent in tha United Ststes.

AVELING & PORTER'S ROAD AND FARM LOCOMOTIVE AND WAGONS.

The Largest Mine Ventilator.

The largest mine ventilator in the world is a Guihal fan, 45 feet in diameter, 12 feet fsce, at the Usworth colliery, near Newcastle-on-Tyne. This fan runs ahont 45 revolutions per minnte, and is said to circnlate 200,000 to 250,000 cubic feet of air per minnte. It is driven hy two first motion enginas, 30 inch. diam. cylinders, three feet stroke. The npcast shaft is 10 feet dismeter, and 600 feet desp. The workings in three seams ara vantilated throngh it. Tha ontpnt of the Usworth colliery is ahont 1,500 tons per day. The mines ara very extansiva. All the nndergronnd hanlaga is performed by machinery; two of the three seams are worked on the bord and pillar system; tha other is worked on the long-wall plan.

Small air engines stationed on the 1,400-foot lavel of the Consolidated Virginia mine, and nsed for hoisting from the north winze of that level, and to fnrnish air for the minars, prove a complete snccess, and a most invalnabla anxiliary for the prosecntion of work of that kind.

The decision of the Secretary of the Interior in tha mstter of the contested survay of the rancho Caslamayomi leaves tha qnicksilver minas ontsida of the honndaries of the Montenagro grsnt.

CORRESPONDENCE.

El Dorado County—Canals and Mining.

EDITORS PRESS:—No time within the last 12 years has the future outlook for El Dorado county appeared so bright as it doss to-day. New developments are daily hsing made in mining and agriculture, and manufactures ars sure soon to follow in the wake. On the north side of the county the California Water Co., hy enlsrging and extending thsir canal, and furnishing an abundance of water to miners and agriculturists at rsssonahls ratss, have inspired confidencs in the people, who are working their claims or tilling their lands.

On the north side of the South fork, not far from the Chili Bar bridge, Messrs. Holmss (of yonr city), Reiggs & Petsrson havs made a discovery of what appears to be gold-hesring soapstone. The ledge—or soft rock—lies much like a vein of quartz, running north and sonth with a dip to the esstward, slate rock wall on the wsst, with a soft, grssn granite or marl for an esst wall. The vein is some 20 fsst wide, holding thst averags to the depth they have sunk—35 feet. At lsast four times as mnch of the ore can he minsd out and crushed in the same time by the same power, as could bs of qusrtz. The owners are now having several tons of the ore brought to this city for reduction. Estimatss of its yield run from $12 to $30 per ton. Herewith I ssnd you a small piece of the rock presented ms hy Mr. Holmes. You can sse and judge of it for yourssIf.

Similar mines to this, hssides those of quartz snd gravel, are hsing developed in thst vicinity.

Mines Near Placerville.

The Gross quartz mine, situated just north of this city, ie still being worked. Mr. Grose had several tons of rock brought to town and crushed last week. The yield wss $123 per ton, being $50 less per ton than the previous crushing. It is conceded by miners to be a valuable mine, although it is not as fully developed as it should be. Brewster & Co., on Oregon hill, are still sinking, being now some 400 feet from the surface, with fair prospects.

Prospect Flat, Robinson & Co's cement and grsvel claim, I am informed, is yielded remarkahly well, they hsving a hreast of gravel six feet in thickness, which is extremely rich. This claim hae paid lsrge dividends for more than three years. Dickeroff & Goyan's cement mill is paying well, I am informed. Thie mill has paid from the commencement.

Patridge & Co. sometime ago purchased the Crusen clsim at Smith's Flat. This is the claim from which several dismonds have bsen taken. The purchasers soon after found that for drainsge and to make the claim a success, they must hsve the Granite tunnel claim and mill, which they purchssed and went to work extracting grsvel from the claim and crushing it. After a run of scme three weeks they concluded to look for the "color," but it was hardly perceptihle on the plates—which caused sorrowful looks smong the owners—hut on an examination of the mortsrs, a large yield was obtained sll in large chunks, rangiug from one dollar to twenty, which were unable to pass through the screen; the sight of which brightened up the countenances of our English friends, for it had been whispered thst when the Granite company sold, they came to the conclusion that they had succeeded in getting an elephant off their hands.

Judge Turner, from the Silver State, was here a short time since, looking after a qusrtz claim which he owns, and which I understand is soon to he put in working order.

The most important thing I hsve to chronicle is the constructing of

The El Dorado Water and Deep Gravel Mining

Company's canal. This is a mammoth work. Already nine miles hsve heen dng, and there is a force of from ten to twelve hundred men at work upon the line, and constructing dams st the outlet of the lakes in the mountsins, converting those lakes into catchment basins to hold the water caught up in winter for use among the foot-hills in smmmer. The canal is of sufficient size to float lumber to within a short distance of this city, and will deliver five thousand inches of water every ten hours for mining, manufacturing or agricultural purposes along the hills and gulches in this vicinity. It is hardly to be expected that this work will he completed before another summer, yet a large amount of water will he run through it the coming mining season.

Right here allow me to digress a little from my subject. As a rule every large town has a class of persons who may be styled "hummers" and "croakers;" who by hook or crook dress well; who are in everybody's mess and nobody's reckoning, unless thoy have horrowed a dollar from you; who stand upon the corners of the streets ready to "bum" a drink of whisky at some place where they can obtain a free lunch, after which they will perch themselves in front of a hotel, and pick their teeth until the stage arrives, looking out for new comers, to whom they cau disclose their wonderful knowledge about things they do, or do not kuow. Placerville is not an exception to the rnle. Not long since an agent for an English company was sent here with letters to a gentleman of this place, who at the time was away from town. The agent's business was to examins some mines preparatory to purchssing. It sssms that this agsnt fell into the hands of one of those affahle croakers, who informsd him that the new ditch company hsd a monopoly of the water and mining ground in this vicinity; that if any one had olaims, this monstsr company would "freezs" them out by extortion or preventing thsir having water, and finally possess themssIves of the whole country. Thia sgent concluded if that was the gsme to bs plsyed here, ths soonsr he rsturned to San Francisco the bettsr, and he left by the next conveyance, and reported to his principsls whst he had lsarned; who soon informsd their correspondsnt here of ths result. Now a more infamous pisce of croaking and downright lying was never put aflost, than was told to this agent. The El Dorado W. & D. G. M. Co., whsn they purchased the csnal and watsr rights of the South Fork Canal Co., also purchased the Excelsior mining claim, of the sams partiss. This claim comprises ahout forty acres and has from tsn to two hundred feet in dspth of gravel.

Their first proposition wss to purchsse the canal and watsr rights only, but the gentlemen who orgsnizsd this compsny being some of the best business men in the State, deemsd it advisahle to have this claim on which they could nse thsir surplus water and purchased it, paying a large sum for ths same. I sm informsd by an officer of the company that this claim is ths only plscsr mining grsnnd sver purchssed or ownsd by this company. The capacity of the csnal is 12,000 inches per 24 hours: Now, allowing for leakage, evaporation and waste in mining, 2,000 inchss, there will remsin 10,000 inches for uss, of which the company cannot use ovsr 3,000 inches, leaving 7,000 inchss for sale at rsssonsble rates. which croaksr or any one else can havs in such quantities as thsy may wish, by paying for it. After having constructsd a work at a cost of $400,000 or more, the company ars not going to throw away their profits in order to "freezs out" some poor minsr, as croaker would hsve etrangers to believe. A coat of tar and feathers is what crosker needs.

A Woolen Mill Wanted.

There is no place in the State which sffords such favorahle facilities for a woolen mill as does Placerville at this time. Lumher can be floated near to town of which it could he constructed; the wool passes here upon the sheep to and from the mountains in spring and fall, which could he sheared and purchssed at the factory door; the power conld be obtained et a price not to exceed twelve dollars per day, for mills equal in capacity to the Mission mills at San Frsncisco; while we have plenty of boys and girls, young men and young women—not Chinamen, hut Americans—that sre willing to work and would be glad of such a chsnce to earn a livelihood; besides, transportation of the products could he done at a low figure, hy freight tesms, which haul goods from the rsilroad for our merchsnts snd now return empty. Gentlemen capitalists, who are seeking chances for good investments, give our town a visit, and see for yourselves the advantages we possess; but avoid hummers aud croakers on your arrival. E. N. S.

Placerville, Aug. 4th, 1874.

WOON BOOKS.—In the museum at Cassel, Germany, is a library made from five hundred European trees. The hack of each volume is formed of the hark of a tree, the sides of the perfect wood, the top of young wood, and the bottom of old. When opened, the book is found to be a box, containing the flower, seed, fruit and leaves of the tree, either dried or imitsted in wax. At the Melbourne Intercolonial Exhihition, of 1866, Colonel Clamp exhibited specimens of Victorisn wood converted into smsll boxes of book form, sccording to a design suggested hy that gentlemsn at the Victorian Exhihition of 1851, and then suggested hy Bsron Ferd. Mueller. Nothing could be more convenient and more interesting than a librsry (to spesk allegorically) of suoh imitation hooks, representing the different timber of various countries, which could he systematically, or alphabetically, or geographically arranged. Australia alone could furnieh of euch a collection more than a thousand volumes. At the Paris Exhibition of 1867, Russia showed a similar oolleotion of wooden books, cleverly designed, showing the bark as the back hinding, and lettered with the popular and scientific names of the wood. Each book contained samples of the leaves and fruit of the tree, and a section and shaving, or veneer of the wood. —*Jour. of Ap. Sci.*

CADMIUM YELLOW.—Of all the substances which have hitherto heen used to impart a vivid handsome yellow to toilet soaps, the sulphide of cadmium has given the best satisfaction in practice. The light of the sun and time do not alter the appearance of the soap colored with it, and only a proportionally small addition of the color to the soap is needed to produce a handsome yellow. This addition is effected by rubhing the cadmium oarefully to a very fine state of division with a little oil, and then adding to the soap mass while the latter is continually stirred. The color is not dissolved in the soap, but very finely divided in it. Two ehades of the cadmium yellow, one of lemon and the other of orange color, are furnished to the market.

GOON RUN.—The Manzanita mine, in Nevada county, pans out well. At the last clean up over $20,000 were realized. A clean np, a few weeks ago, gave a large amount. Mining is not quite played out in that vicinity.

The "Batea."

Mr. H. G. Hsnks fnrnishes the *Alta* with the following intsresting facts in rslation to the introduction and use of this useful instrument, which should bs used much more than it is in prospecting, and for testing purposes at ths mill and mine: This spparatns originated in Brszil, where it is in common use in ths diamond aud gold mines. As found in Brszil, it is simply a shallow wooden howl. But the skill of the miners in using it is somsthing remarksbls. Mr. Attwood (the wsll known mining expert of this oity) has greatly improved its form. As he constructs it, it is a turned circular dish, of dark colored hard wood, of about ons foot in diameter, sometimss more. The csntsr of the disc is depressed, the radii forming sn angls of about 160°. This appsratus gives remsrkabls rssults. If only a minnte trsce of cinnabar or msrcury is contained in the rock, it will bs seen. The msnner of using the *batea* may bs describsd as follows:

Quite a quantity of water will be required. This may he contsinsd in s tank or lsrgs tub, or may he a convsnient place near the hank of a strsam or lake. The pulverizsd ors—sevsral pounds at a time—is placsd in ths *batea*, which is grsdually sunk in the water. Ssvsral times it is broksn down with the fingers, while the *batea* flosts on the wster. When ths ore is thoroughly wst and formsd into mud, the *batea* is tsken by the rim with both hands and again sunk in the water. A circular motion is then imparted to it (soon lesrned by practics). The lighter particles will continuously flow over the edges and sink, while the hesvier ones collect at the center. When only a small portion remsins, the *batea* may he lifted, and the watsr held in the dspression caused to swssp round the centsr, while one edgs is slightly depressed. This motion will grsdually rsmove the heavier particles toward the dspressed part. If thsrs is any gold, platinum, gslens, cinnabar or other unusually heavy substance, its grsvity will resist the power of the water, while the comparatively light particles move slowly forward. The form of the vessel is such that the heaviest matter forms a point and can be closely observed. If there is s particle of cinnabar present, it will be found at the point of the prospect, olearly distinct from all other substances. The value of the *batea* to the prospector cannot be too highly estimsted, and it should come into more general uss.

Fecundity of the Lower Animals.

The lower sn animsl stands in the scale of organizsd beings, the more it is snbject to destructive agencies, which would soon cause the race to become extinct were it not that nature hss compensated this by provisions for the most prodigious fecundity. This ie forcibly illustrated in the case of fishee, which produce so many eggs that if vast numhers of eggs and fish were not continually heing destroyed, they would at last fill up sll the waters. For instsnce, msn alone takes ahout 60,000,000 or 70,000,000 codfish from the sea anuually around the shores of Newfoundlaud. But even that quantity seems small when we consider that esch cod yields something like 4,500,000 eggs each scason, and that even 8,000,000 hsve been fouud in the roe of s single cod. Suppose the 60,000,000 cod caught on the coast of Newfonndland were left to breed, the 30,000,000 femsles producing each 5,000,000 egge every yesr, it would givs a yearly sddition of 150,000,000,000,000 young cods. Other fish, though not equslling the cod, are wonderfully productive. A herring six or seven ounces in weight is provided with about 30,000 ova. After making all ressonahle allowances for the destruction of eggs and of the yonng, it hss been cslcnlated that in three yesrs a single pair of herrings would produce 154,000,000, and Buffon cslculsted thst if a pair of herrings could be left to breed and multiply nndisturbed for a period of 20 years, they would yield an amount of fish in bulk equal to the globe on which we live.—*Manufacturer and Builder.*

PRACTICAL SCIENCE AS A TRAINER.—Professor Williams, in an interesting article in *Nature*, relating to the practical achievemeuts of Count Rumford, says: The main interest of the career of this wonderful man appears to me to lie is this, thst it affords a magnificent demonstration of the practical value of scientific training, and the methodicsl application of scientific processes to the hueiness of life. I have long maintained that every father who is able and willing to qualify his son to attain a high degree of success, either as a man of hnsiuess, a soldier, a sailor, a lawyer, a statesman, or in any responsihle department of life, should primarily place him in a lahoratory, where he will not merely learn the elements of science, hut he well trained in carrying out original physical research, such training being the best of all known means of affording that discipline of the intellectual powers upon which all practical success depends.

ADVERTSING.—There is a man in Msssachusetts who has exploded the popular fallacy that a man has to advertise to succeed in business. He commenced business forty-seven years sgo, with a capital of $800; he hasn't spent a cent in advertising since, and is now worth $805.

THE top dirt in the Illinois mine at Moore's flat gave a clean up of $16,500 last week. They expected to begin working gravel from the bedrock on Monday, and after this much heavier results are anticipated.—*Tidings.*

The Centennial Exhibition.

The resdsrs of our paper are probably wsll informed as to the general plan of our great Internstional Exhibition which is to bs held in Philadelphia, 1876. For the bensfit of those who desire more explicit information on the subject, below we give the rulss and regulations of the Exhibition. Commissioners from all the States and Territoriss have beeu appointed. J. Dunbsr Creigh, Ssn Francisco, is the Commissioner for California. Alternste, Benjamin P. Kooser, Santa Crnz. Mr. Creigh is also one of the Vics-Presidents of the Commission. Jossph R. Hswley of Connecticut is President of the Commission for the yesr 1874-5. John L. Campbsll of Indiana is Secrstary for the same tsrm:

RULE I.—The Exhibition will be held at Fairmount Park, in the City of Philadelphia, and will be opened on the 19th day of April, 1876, and closed on the 19th of October following.

The ten departmsnts of the classification which will determine the relativs location of articles in the Exhibition—except in such collective exhibitions as may receive special eanction—and also the arrangemsnt of names in the Catalogus, ars as follows:

I. Raw Materials — Mineral, Vegetable, and Animal.

II. Materials and Manufacturss used for Food, or in the Arts, ths rssult of Extractivs or Combining Processes.

III. Textile and Felted Fabrics; Apparel, Costumes, and Ornamente for the Person.

IV. Furnitnre and Manufactures of general use in construction and in dwellings.

V. Tools, Implements, Machinss and Processes.

VI. Motors and Transportation.

VII. Apparatus and Msthods for the increase and diffusion of knowledge.

VIII. Engineering, Pnhlic Works, Architectnrs, etc.

IX. Plastic and Graphic Arts.

X. Objects illustrating efforts for the improvsmsnt of the Physical, Intellsctual, and Moral Condition of Man.

RULE II.—Applioations for space and negotiations relative thereto should be addressed to the Director-General, International Exhibition, Philadelphia, Penn.

RULE III.—Exhibitors will not he charged for space. A limited quantity of steam and water power will he supplied gratuitously. The quantity of each will he settled definitely at the time of the allotments of space. Any power required hy the exhihitor in excess of that allowed will be furnished by the Commission at a fixed price. Demands for snch excess of power must also he settled at the time of the allotment of space.

RULE IV. — Exhibitors mnst provide, at their own cost, all show-cases, shelving, counters, fittings, etc., which they may require; and all countershafte, with their keys, belting, etc., for the transmission of power from the main shafts in the Machinery Hall. All arrangements of articles and decorations must be in conformity with the general plan adopted hy the Director-General.

Special constructions of any kind, whether in the buildings or grounds, can only he made upon the written approval of the Director-General.

RULE V.—The Commission will take precantions for the safe preservation of all objects in the Exhibition, but it will in no way be responeible for damage or loss of any kind, or for accidents hy fire or otherswise, however orignating.

Favorahle facilities will he arranged hy which exhibitors may insure their own goods.

RULE VI.—Exhibitone may employ watchmen of their own choice to guard their goods during the houre the Exhibition is open to the public. Appointment of euch watchmen will be subject to the approval of the Director-General.

RULE VII.—Exhibitors, or such agents as they may designate, shall be responsihle for the receiving, unpacking, and arrangement of objects, as well as for their removal at the close of the Exhibition.

RULE VIII.—The transportation, receiving, nnpacking, and arranging of the products for exhibition will be at the expense of the exhibitor.

RULE IX.—The installation of heavy articles requiring foundation should, by special arrangement, begin as soon as the progress of the work upon ths building will permit. The general reception of articles at the Exhibition Building will commence on January 1st, 1876, and no articles will he admitted after March 31st, 1876.

RULE X.—Space not occupied on the 1st of April, 1876, will revert to the Director-General for reassignment.

RULE XI.—If products are not intended for competition, it mnst he so stated by the exhibitor; and they will be excluded from the examination by the International Juries.

RULE XII.—If no authorized person is at hand to receive goods on their arrival at the Exhibition building, they will be removed without delay, and stored at the cost and risk of whomsoever it may concern.

RULE XIII.—Articles that are in any way dangeroue or offensive, also patent medicines, nostrums and empirical preparations whose ingredients are concealed, will not be admitted to the Exhibition.

RULE XIV.—The removal of goods will not he permitted prior to the close of the Exhibition.

RULE XV.—Sketches, drawings, photographs, or other reprnductions of articles exhibited, will only be allowed upon the joint assent of the exhibitor and the Director-General; but views of portions of the building may be made upon the Director-General's sanction.

RULE XVI.—Immediately after the close of the Exhibition, exhibitors shall remove their effects, and compiete such removal hefore December 31, 1876. Goods then remaining will he removed by the Director-General and sold for expenees, or otherwise disposed of under the direction of the Commission.

RULE XVII.—Each person who becomes an exhibitor thereby acknowledges and undertakes to keep the rules snd regulations established for the government of the Exhibition.

Special regulations will he issued concerning the exhibition of fine arts, the organization of international juries, awards of prizes, the sale of special articles within the buildinge, and on other points not touched upon in these prelliminary instructions.

RULE XVIII.—An official catalogue will he pnblished in four distinct vereions,—viz., English, French, German and Spanish. The sale of catalogues is reserved to the Centennial Commission.

RULE XIX.—Communications concerning the Exhibition should be addressed to "The Director-General, International Exhibition, 1876, Philadelphia, Penn."

The Centennial Commission reserves the right to explain or amend these regulations, whenever it may be deemed necessary for the interest of the Exhibition.

A. T. GOSHORN, Director-General.

JOHN L. CAMPBELL, Secretary

Philadelpia, July 4th, 1874.

A PRACTICAL ARGUMENT IN FAVOR OF CREMATION.—The "catacombs" of Rome comprise forty-two lahyrinthine undergronnd cemeteries, with 587 miles of galleries, and it is estimated that between four and seven millions of bodies have found sepnlture therein. What a pestilent breeding hole it must bave heen.

MECHANICAL PROGRESS.

Writing Machine.

A medal has been given by the Emperor of Austria to Rev. Malleny Hansen for an ingenious apparatus known as "the writing ball," which is described as follows: The instrument consists of a half sphere of gun metal, pierced with radial apertures to the number of 52, all converging to the center. The half-sphere rests on a frame firmly fixed to a bed plate. Each of the holes in the half sphere or ball has a piston ground off horizontally at its bottom, upon which is engraved a letter or figure. When a piston has been pressed in, a spiral spring raises it when it has been released. These pistons, when pressed down, impinge upon a level writing plate, which can be moved through the center of the writing ball. This table has four wheels running upon rails, which rails again are fixed to another movable frame. The plans of the movement of the lower frame is at right angles to that of the upper one. Upon the writing table is arranged a kind of tympan to hold a sheet of white paper by its edges. Upon the whits paper is laid a sheet of carbonized paper. On pressing one of the knobs the lower end of the piston impresses a type on the paper; the knob then touches the spring under it, whereby electrical contact is established. The pistons corresponding to the letter to be printed are depressed in their order, and the letters appear on the paper in a line vertical to the operator. Speed is considerably augmented by the arrangement of the knobs or pistons into groups, easily covered by the whole of the 10 fingers.

After some practice the pistons can be worked at the rate of 10 per second, or three or five times quicker than ordinary writing with a pen. All kinds of paper can be employed, and of any thickness, by means of a vertical adjustment of the writing ball. If 10 layers of thin paper are employed, with interposed layers of carbonized paper, all 10 pieces receive the same impression. By passing these 10 impressions with interposed tissue paper through rollers, double the number of copies are obtained.

Diver's Outfit.

Reports of experiments made in England, to test a new apparatus, are at hand. Hitherto an insuperable difficulty has been experienced by divers, in being unable to communicate verbally with the attendants above, the principle usually adopted by divers being to give preconstructed signals by so many pulls on a signal line. This, however, appears to have been at length overcome. In the trials just completed in Chatham harbor, an experienced diver equipped in an improved diving apparatus, made the descent, and during the whole time he was under water was enabled by means of the new apparatus to converse freely with those above, every word spoken by him being distinctly heard and understood. It is stated that the invention would be further improved upon, so as to facilitate its use in all diving operations connected with the harbor works, and for laying stone blocks, etc., in connection with subaqueous operations. The diver signals the attendant, who places his ear to a small cone at the top of the tube, whence a message can be distinctly heard. The diver has the apparatus completely under his control, and by placing his mouth to the mouthpiece, inside the helmet, and then turning a cock on the ontside, can communicate instantly with the attendant. The apparatus can, it is stated, be easily applied to any description of diving dress. The value of the invention will be readily understood and appreciated by every one interested in the science of diving, from the simple fact of the great confidence a diver will gain from being in his isolated position enabled to speak directly to those in whose hands his life for the time being is literally placed.

MICROSCOPIC.—The *World of Wonder* records the following: In the twentieth year of Queen Elizabeth, a blacksmith, named Mark Scaliot, made a lock consisting of eleven pieces of iron, steel and brass, all of which, together with a key, weighed but one grain. He also made a chain of gold, consisting of 43 links, and having fastened to this the before mentioned lock and key, he put the chain about the neck of a flea which drew them all with ease. All these together—lock and key, chain and flea—weighed only one grain and a half. Oswaldus Nothingerus, who was more famous than Scaliot for his minute contrivances, is said to have made 1,600 dishes of turned ivory, all perfect and complete in every part, yet so small, thin and slender, that all of them were included in a cup turned out of a peppercorn of the common size. Johnnes Shad, of Meiteband, carried this wonderful work with him to Rome, and showed it to Pope Paul V., who saw and counted them all by the help of a pair of spectacles. They were so small as to be almost invisible to the eye.

THE *Federation Artistique* says that a Venetian founder, named Giordini, has discovered a new process of casting, by the operation of which and at a single flow of the liquid metal, not only large statues, but groups of the most elaborate complexity, can at once be produced, and with so fine a finish that no supplemental chiseling is required.

What is the Best Rail?

At the recent meeting of the Association of Civil Engineers, the committee on the "Manufacturs of Rails," reported that the English system of rails, which requires great strength, is not applicable to this country, where endurances is the chief requisite. Strength is the first consideration where the wear is heavy; but where the wear is light, the rails should be as light as is safe. The greatest amount of metal should be at the head of the rail, where there is more wear; and the theory that a head 2¼ inches wide will endure more than one 3 inches wide, is erroneous. Low, wide rails are better than high, narrow ones, with the present heavy machinery. Rails might be made more rigid if the foundation were better and there were no frost; but, as it is, a moderately flexible rail is best. A square rail would be too flexible, and those with a stem and base are much better. It would be advisable to put 60 per cent. of the metal in the head were it not for the fact that a double-headed rail wears out fast. The average wear of an iron rail is equal to a pressure of 4,000,000 tons dead weight, or 10,000,000 tons gross weight. The stone ballast of the American roads has been too large; and on a good road a rail would last fully 25 per cent. longer than on a bad one. In cold weather the metal is more brittle than in summer; consequently the breakage of rails in winter is greater in proportion. In the absence of definite figures as to the comparative value of iron and steel, the committee were of the opinion that a steel rail was 20 per cent. better than a good iron rail, 40 per cent, better than a fair iron rail, and 100 per cent. superior to the ordinary rail used on many roads.

MASTS OF IRON.—An exchange, in speaking of the construction of the new P.M.S.S. "City of Peking," dwells particularly upon the masts: These, three in number, are of iron, 138 feet in length, with a diameter from eight to thirty-six inches. They are formed of heavy rolled plate iron, and their construction was a work of difficulty, patience and labor. About 50 men were engaged actively in their completion, some of whom were obliged to work inside. There is barely room for a man inside, and his progress through the iron tunnel was analogous to ascending a tight chimney, with all the advantages in favor of the sweep, inasmuch as the latter can keep his head perpendicular, while the workers must lie horizontally, and that, although sheds were erected over the masts, water poured on to keep them cool, and air introduced by pipes, the men could not remain in their iron prison house more than fifteen minutes.

A NEW DOUBLE SHIP.—Some years ago there were employed between New York and Brooklyn, a set of steam ferry boats having double hulls, propelled by a paddle wheel placed in the middle, between the hulls. The two vessels were coupled together by strong beams, and covered by a broad deck. Recently, in England, they have launched a new ferry boat, built on the above general plan, intended to ply across the English channel. At present they run very small boats, and passengers are greatly troubled with sea sickness. The new boat has two hulls, each 17 feet wide and 290 feet long, separated 26 feet, and united by a deck or superstructure 60 feet wide and 183 feet long. This makes a broad and comfortable boat for passengers. She will be propelled by a central wheel, with engines of great power. Each hull has a rudder at the bow and stern, making four rudders in all.—*Exchange.*

BRICK-MAKING MACHINE. — An English exchange, *Iron*, speaks of a brick-making machine which compresses 1,500 bricks per hour, but which is capable of producing, if required, a much greater quantity. On a revolving horizontal table are fixed six dies for compressing the clay. On one side of the table stands a man who fills each die with clay, and a man on the other side removes the clay after it has been compressed. Each die is fitted with a hinged lid and a sliding bottom, and as the table revolves the die passes under a fixed plate which compresses the clay. The clay is delivered in a column down an incline from the pug-mill, and is cut into blocks of the required size by a very simple apparatus worked by a man who fills the dies.

RENOVATING STONE FRONTS BY A JET OF STEAM. Hanover church, London, which had become incrusted with a thick mass of black smoke, has been restored to its natural color without tooling or drugging the surface of the stone. A workman, whose head and hands were sheathed in a protective covering, directed the nozzle of a pipe connected by tubing with a boiler on the pavement below. At a pressure of 56 pounds to the square inch, the wet steam, assisted by the action of wire and hair brushes, was found effective. At first, strong lyes were used, in the form of a wash previous to applying the jet, but they were found unnecessary, and were soon abandoned.

A NEW life-saving invention has recently appeared in Paris, in the shape of a durable garment, which covers the entire body. It is made of rubber, and is provided with a flexible tube, which has a mouthpiece. By blowing into the latter, the person in danger inflates the garment, which buoys him up when in the water.

THE first vessels constructed of iron were built for the canals of Great Britain. There is extant a published drawing of one, dated July 28th, 1787, and a description written in Birmingham, England.

SCIENTIFIC PROGRESS.

Sun Spots.

In the course of a lecture on the sun, Mr. Proctor state that it had been found that the spots gradually increase and diminish in number until they disappear, and the period during which they thus waxed and waned was 11 years. After that it was noticed that the magnetic influences of the earth waxed and waned in intensity. The magnetic needle was exposed during the course of every day to the swaying motion by which it seemed to try to follow the sun—a very slight influence indeed. That change underwent variation, sometimes greater and sometimes less, and it was resolved to watch that progress and the period in which it took place, and the result showed that in a period of eleven years that slight swaying of the magnetic needle underwent a change, and that change corresponded with the number of spots upon the sun. When the spots on the sun were most numerous it swayed greatest; and when they were not so numerous it swayed less.

There is an intimate connection between the spots and condition of the sun and these seemingly terrestrial influences. The subject had been receiving much attention, and suddenly, in the year 1859, on the surface of the sun a bright spot made its appearance, and it was found that the magnetic needle at Kew had made certain changes. The whole surface of the earth had been affected by magnetic tremblies, and everything proved that the sun had at that moment spread magnetic influences not alone over the earth, but over the entire planets. A new bond of harmony had been found within the solar system. What were these surfaces in the sun; were they clouds, were they mountains in the moon, or ruddy mountains of flames? During the eclipse of 1868 that question was answered, and it was found that they were no mountains, nor clouds, nor flames, but a mass of glowing hydrogen. This discovery was made by the spectroscope.

EXPANSION.—Prof. Guthrie says: As a rule, gases expand more than liquids and liquids more than solids for the same increase of temperature, and so, according to the well-known law of mechanics, we should expect to find the force of expansion of solids greater than that of gases. Accordingly the force exercised by expanding solids is almost irresistible. Iron rods are bent or snapped when their centers are pulled by contracting metals. A semi-solid mass, as of glass, suddenly cooled, becomes brittle. A drop of hot glass cooled in water becomes solid and rigid on its outside; then the inside cools and shrinks so that the whole, when cool, is in a condition of internal strain or unstable equilibrium. Disturbed in one place, the whole crumbles to pieces in its endeavor to assume the proper size due to its temperature. The process of annealing depends upon the so gradual cooling of a soft body that the parts get to their proper distances. The bursting of pipes in winter time proves two things: first, that ice is lighter than water; and second, that ice is almost incompressible. Water frozen in a bomb-shell two inches thick will burst it.

COMBUSTION is a chemical process, consisting usually in a combination of one of the elements of our atmosphere (the oxygen) with the fuel. The main substance of fuel, especially when it is coal, is carbon, and the chemical equivalent of this, 12, combines with 2 chemical equivalents, 2 x 16, or 32 parts by weight of oxygen, which is equal to 2¾ parts of oxygen for every part of carbon. A pound of coal requires thus 2¾ pounds of oxygen for its perfect combustion; as now 1 pound of this gas under ordinary atmospheric pressure occupies a space of some 12 or 13 cubic feet, or 2¾ pounds of oxygen a space of 34 cubic feet, which in the air is diluted with four times this amount of nitrogen, it requires five times this quantity, or not less than some 170 cubic feet of fresh common air to furnish the oxygen required; it is therefore necessary to pass 170 cubic feet of air through the furnace grate in order to secure the perfect combustion of every pound of coal. If less air is passed, the combustion is retarded or imperfect; while an excess of air cools the furnace, and is thus conducive of loss. This shows why the regulation of a proper draft is of so great importance. — *Manufacturer and Builder.*

PYROLITH.—A fuel, burning without smoke, needing no attention after lighting, and said to be especially adapted to heating railway carriages, has been patented. It consists of a mixture of pulverized charcoal or coal with some material affording oxygen when heated, as nitrate or chlorate of potash, etc. Some cementing substance, such as gum, starch, or water glass, is employed to form into cakes, which are compressed and dried at a gentle heat. A special apparatus has also been devised for its combustion.

NEW MEAT PRESERVING PROCESS. — M. Sacc has obtained excellent results by using acetate of soda in powdered form. The meat is placed in a barrel and the acetate placed in, when it is left for 48 hours. Thus prepared, the meat, it is said, will keep for any length of time, and may be prepared for cooking by soaking for 12 hours in water, to every quart of which a quarter of an ounce of sal ammoniac is added.

New Method of Lighting Gas.

A foreign exchange says a novelty in gas-lighting apparatus has been tested on the street lights of Preston, England, with satisfactory results. The apparatus is described as resembling a small globular inkstand of glass, surmounted by a tube of the same material, with a metallic top; and by screwing off this burner it can be very easily attached to any lamp, chandelier pipe, or ordinary gas jet. The base or globular portion is filled with a deep red colored liquid—a simple chemical mixture with no combustible properties, almost without smell, and so cheap that threepenny worth of it will serve one lamp for twelve months. Over this liquid, and within the glass tube, there is a plate of zinc, with a piece of graphite or gas coal, and between these and a thin coiled platinum wire, fixed over the cap of the general vessel, into which a gas burner is inserted, galvanic communication is obtained. Ignition is effected in the following way: A pipe, to be screwed to that up which the ordinary gas supply flows, runs through the base of the vessel to about the center of the surmounting tube; pressure brought to bear upon the gas in this pipe causes, by small collateral openings; a simultaneous depression upon the chemical solution which occupies a lower level in two side tubes; the gas occupies the vacuum caused by the displaced liquid, and then ascends to a chamber in connection with the burner, while the displaced liquid is pressed into two side tubes, effecting contact with the zinc and graphite, generating galvanic activity, which is communicated to the platinum wire, and exciting the catalytic power of the wire, which, when exposed to the ascending jet of gas, results in immediate, almost instantaneous ignition. The mechanism is of the simplest construction, and can be applied to any kind or number of gas pipes, either remote from or proximate to the works, to street as well as to office or shop lamps, and the light can be extinguished as quickly as it can be ignited.

CHEMISTRY ON THE STAGE.—The papers tell us that a new sensation is to be introduced on the stage. An actress fixes a dose of poison for her rival; then in a French fit of virtue and remorse, gulps the dose herself, directly has a pain, a worse one, a pang, a cramp, and finally convulsions, during which her face, neck and arms go through the changing hues of white to gray, gray to purple, and purple to black; when she very properly dies. This is accomplished by the application of some wash to the skin, and the turning on at the proper moment of some vapor or gas, which acts upon the chemical property of the cosmetic worn. The effect is startling and very sensational. A well-known actress from another theater fainted at the first performance of this death and its variegated complexion. It is not difficult to perform, however. The cosmetics contain bismuth or lead, and the floor or pillow upon which her head rests is sprinkled with a solution of sulphuretted hydrogen.

NITROGEN AND PLANTS.—In a notice of Deherain's work on agricultural chemistry, recently published, the important question is raised—In what form is nitrogen assimilated by plants? Kuhlmann maintains that nitrates are not taken up until reduction has taken place, and their nitrogen has entered into an ammonical combination. On the other hand, Cloez holds that ammonical salts are inactive till their nitrogen has passed into a nitro-compound. Neither of these views has as yet been demonstrated. M. Deherain combats the view of M. Ville that plants can assimilate directly the free nitrogen of the atmosphere; but he holds that in soils containing decomposing organic matter, the nitrogen of the air forms ammonia in the absence of oxygen. Carbonic acid is formed and nascent hydrogen unites with the atmospheric nitrogen to form ammonia.—*Chemical News.*

FOSSILS OF THE DEPARTED.—A German inventor, Dr. Von Steinfels, seems to have hit a happy medium for disposing of the dead, which is at least free from the objections urged against burial, while it does no violence to the feelings which naturally shrink from destroying by fire the corpse of a beloved friend. It is proposed to place the body in a sarcophagus made of stone, and to pack around the corpse artificial stone or cement in a plastic state. The latter being allowed to harden, the remains become like a fossil embedded in the solid rock, and, if need be, the deceased finds his grave and his monument in one and the same mass —*Scientific American.*

M. ALVERNAT has devised an ingenious apparatus which shows that an electric current will not pass equally well in two directions. Two glass tubes are connected together at the ends by arched pieces, and in one the points of a number of small glass pipes are turned in the opposite direction from those in the other tube. The current instantly passes through the tube in which the points are apex toward the negative poles. The tubes are filled with hydrogen, showing the oscillation of the luminous zones with great clearness.

THE discovery of alcohol in organic liquids is often of great difficulty, owing to the small quantity of liquid which the chemist has at his disposal, and the absence of any distinguishing test.

RED COLORING MATTER OF THE BLOOD.—M. Béchamp has isolated the red coloring matter of blood, which shows the presence of iron.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

Mining Stocks.

The stock market has been feverish during the past week. The general tone of the market has been no better, but there have been one or two efforts to move up in certain stocks. In the Comstocke an npward movement in Savage and Opbir was noticeable. Reymond & Ely and Meadow Valley at Pioche also showed a slight advance. California and Idabo stocks remain very dull.

Belcher turned out 12,300 tons of ore last montb, which yielded $694,000—$56.50 per ton. The expensea were $316,000, and from the $378,000 tbat remained, $312,000 was paid out as a dividend on the 10th inst.

The Chariot mill and mining company hae paid ite first dividend of 40 cents per share. This mine paid its owners bandeomely before it was incorporated, and we have expected to see it in the list of dividend-paying mines.

Tbe Trustees of the Yellow Jacket miniag company have levied an assessment of $5 per share, amounting to $120,000, delinqaent September 15th. This is tbe eighteenth time that stockholdere have been summoned to respond to a simiiar call from tbe Board, and they are becoming tired of tbe monotony. It is just three years since tbe last dividend wae paid, and the total amount tbns disbursed ie only $1,878,000. The eighteen assessments levied amount to $2,304,000. Witb the collection of the present levy, tbe Yellow Jacket mine will have oost stockholders $426,000 more than tbey have got ont of it in dividende.

The Eberbardt mining company to be in faehion proposee to increaee tbe capital stock. The traeteee have called a meeting on tbe 29tb of August to take into consideration the propriety of increasing the capital stock from $2,400,000 in 8,000 shares to $10,000,000 in 100,000 sharee.

Tbe Opbir sqnabble has been settled, the last stumbling-block having been removed by the agreement of both sides to psy their own legal fees. A meeting of the stockholders bas been called by Judge Stanly, at the request of the holders of two-thirds of the 108,000 ehsres, to be beld on Satarday, to conelder the propriety of choosing a new Board of Trustees.

Prices have varied this week as follows: Alpha, $11.25 and $12; Belcher, $61.25 and $66; Beet & Belcher, $24 and $25; California, $37.50 and $39; Chollar, $50 and $54; Cons. Virginia, $73 and $79; Crown Point, $68 and $73; Exchequer, $61 and $65; Gonld & Curry, $18 and $19; Hale & Norcross, $40 and $44; Imperial, $7 and $8.25; Kentuck, $13 and $14; Ophir, $19.50 and $21.75; Overman, $30 and $33; Savage, $56 and $69; Seg. Belcher, $72 and $78; Silver Hill, $6.50 aad $7; Union Cons., $10.50 and $12; Yellow Jacket, $69 and $74.50; Eureka Cons., $11 and $12; Meadow Valley, $6.25 and $7.25; Raymoad & Ely, $11.75 and $15.

Prominent advancee from highest prices of last week are aa follows: Belmont, 62 cents; Eureka Cons., 75 cents; Meadow Valley, 75 ceats; Raymond & Ely, $2; Best & Belcber $1; Californaia, 50 cents; Chollar, $1.50; Confidence, $1; Crown Poiut, $3; Exchequer, $1; Jnstice, 50 cents; Overman, $1.50; Savage $5.50; Seg. Belcher, $3; Union Cons., $1; Yellow Jacket, $1.50. Prominent declines from highest nrices of last week were as follows: Pioche, 50 cents; Bellevue, 50 cents; Chariot Mill, 50 cents; Mahogany, 50 cents; South Chariot, 50 cents; Belcher, $1; Cons. Virginia, $3.50; Dardanelles, 50 cents; Knickerbocker, 50 cente; Occidental, 50 ceute.

THE town of Colnmbia Hill is nesrly mined away. Tbere is nothing left but a narrow strip of land, not more than 250 yarde wide, on whicb the bouses are situated. Were the houses removed, not a foot of tbe ground on whicb tbe town now stands wonld be visible in a month afterward. Great efforts, we learn, are being made to indnce the house owners there to remove tbeir house, so that tbe owaers of the mines can wasb away tbe gravel on wbicb the town is built. Tbe honse owners are stnbborn, aad won't yield.

MINING SUMMARY.

THE following ie mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALAMEDA COUNTY.

LIVERMORE COAL MINE.—Livermore *Enterprise*, August 8: Tbe body of coal now being worked is daily improving in qnality snd qusntity. The company sre expecting to ship a quantity of coal to msrket in a short time. The followiag is a list of coal mining and cosl prospecting compsnies in onr county, eome of wbich ere incorporsted, and others with the intention of being so. Is ours a mining county? Livermore Co., nesr Livermore; Blsck Hawk Co., near Miles; Worland Co., near Hsywood; H. A. Co., nesr Haywood; Heller miae, four miles from Haywood; Oakland Co., nine miles from Haywood; Call Canon, five miles from Haywood; New Prospect Co., niae miles from San Leandro; and Tunnel Co., five miles from Ssn Leandro.

ALPINE COUNTY.

MILLS STARTING.—*Chronicle*, Aug. 1: On Moudsy next, tbe Exchequer quartz mill and Monitor and Northwestern Co.'s mill end furnsce will start np. The Excbeqner will run ou a lot of the richest ore mined in this county. It is thonght there is sufficient higb-grade ore now at tbe mill to enable the manager to pay off the indebtedness of tbe company before working the low-grsde—$30—ore. High-grade ore ie being tsken from the upper tunnel of this miue.

AMADOR COUNTY.

FIDDLETOWN.—Amador *Ledyer*, Ang. 18: This town does not present as lively an appearance as it did in the flush times of placer mining. Instead of depending on tbe mines alone for its support, tbe town hss become the bnsiuess center for a large section of rich agricultural conntry in this snd El Dorado conntiee. Jndge Pnrinton supplies water throngb bis large ditch to the enrrounding country for mining and irrigation parposes. It is valnable property, and csn be extended with small expense to quertz mille at Lower Rancberia, Drytown and Amador City, where tbe water can be nsed to great advantage by tbe mills and mines; and tbe time is not far distant when the extension will be made.

THE Valparaiso mine bids fair to be one of the best in the conuty. The rock is of good character, showing free gold and snlphnrets of the best quality. Tbe ledge is large, well defined and easily worked. Tbe main shaft ie 130 feet deep, and all that is required is a mill and machinery to make it a good paying mine.

STILL IMPROVING.—*Dispatch*, Aug. 8: Reporte from the Amador quicksilver mine continne to be more and more favorable as the work of development progresees. A well defined lead or vein has already been discovered and explored for a considerable distance, but the full extent of the vein is, of course, not yet known.

BUTTE COUNTY.

NEW DIGGINGS.—Chico *Enterprise*, Ang. 7: A discovery has just been made of new and important diggings on the ridge of tbe west bank of the Feather river, about 5 miles from Dogtown. More than 2 miles of the ridge has been staked off into cleims. The prospects made, having been thorough, leave no donbt of the richness of tbe mines, and every preparation is being made for working them. At present, ditches are being dug to briag water from the Hendricks ditcb, bnt tbis is only intended for temporary use, aa Mr. Whitman, from Sau Francisco, is about to construct a ditcb from the bead-watere of the Feather, which will lead tbe water directly upon the claims. Onr iaformant says that in a week or two there will be employed from 150 to 200 ditchers. By D. Boyer we were shown specimens of the gold taken ont by prospects. It is clear, bright, lamp gold; and snch specimens are the best indications of gold in large qnantities.

CALAVERAS COUNTY.

UPPER COUNTY MINING ITEMS—WEST POINT DISTRICT.—The Zacatero continues to supply the mill with a fair quality of ore. Tbe mill consists of ten stamps, weighing 750 pounds eaoh; 2 Hendy concentrators, and 2 Wheeler psns, at present. The Modocs are extracting pay rock pretty lively. The waterpower boisting works of Haskins & Co.. are completed; work in tbe mine has been resumed. A Frenchman who has been ranning a tunnel into a lava ridge, near the old Hatfield ranch, etruck good gravel a short time ago which will insnre him $10 per day, even working in the manner he is now.

FURTHER FROM THE SAN BRUNO.—Thursday of this week the crushing of 100 tons of San Bruno rock, in Garland's mill at Mosqnito, was concluded and the batteries cleaned np. The ore netted an average of $25 per ton. An immense chute of pay ore hss been developed in the San Bruno. A tunnel 200 ft. in length bas been run on the ledge since striking the cbimney, and still there are no indications of reaching the end of it. Rock is being miaed rapidly, and another crusbing of 200 tons will soon be in readiness for tbe stampe.

RICH STRIKES AT THE SHEEP RANCH.—A correspondent informs us that new diecoveries in qnartz have recently been made in Sheep Ranch distriot, and that tbings generally, in that loosility, are in a flouriehing condition.

EL DORADO COUNTY.

SOAPSTONE LEDGE.—*Republican*, Aug. 6: Fif-

teen or twenty tons of the ore taken from ths Sospetone ledge at Chili Bar, ie being haaled to the Breweter mill, in order to test its richuees. All indications thus far werrant the belief that it will prove a good paying ledge.

INYO COUNTY.

Sylvania.—*Independent*, Aug. 1: Messrs. Darrah & Gregg returned from thie dietrict a dey or two eiace, having taken a look at about every location in the district. The sum of their couclusions is eimply thus: That the district everywhere ehows on the surface an ahnadance of the very best smeltiag ores. That the bullion is fully twice as rich as that from Cerro Gordo, and cau be produced, ton for ton of ore, fully 30 per ceat. cheaper. While the workinge, so far, all of which are merely surfaoe comperatively, show as flatteringly as could he wished, yet the fact remains to be demonstrated by deepor aad more extensive workinge whether large nud permaaent bodiee of ore exist there, sucn as to justify the erection of reduction works on a large ecale. For this purpose much more capital than the miners now poseess is imperatively required.

MARIPOSA COUNTY.

Quartz Mining in Oathay's Valley.—*Gazette*, Aug. 8: Last week our correepondent noted the new diecoveriea made in quartz in Cathay'e valley. Seversl veins have been taken up quite rocently, aad the prospect ie favorable for an exteneive paying district.

MERCED COUNTY.

Fortune Huntino.—*Valley Argus*, Aug. 8: Thos. G. Agaew, an experienced quartz aud silver miaer, and ex-Sheriff S. M. Brown, left here on Thursday moraiag last, properly eqaipped and provisioned for an extended tour in the Sierra Nevada rauge of mountaine in search of new and rich gold aad silver fields. Their object is to develop a lode discovered some years ago by Mr. Agnew, from the croppings of which he obtained some rich specimene of rock.

NEVADA COUNTY.

Moore'a Flat Items.—Cor. Nevada *Transcript*, Aug. 8: Onr mines are all rnnning full handed. The Blue Bank Co. have got about ready to clean up, and will, in all probability, do so this week.

The Boston Co. sre running 1,600 inches of water, aad are trying to clear out the digginge which were filled up by a elide last wiuter. The new tunnel is heing driven ahead very rapidly.

The Illinoie mine ie now being "hottomed up," and powder drifts sre aleo being run.

Joseph Ollson is running his mine at Orleans Flat, snd will make a clean-up in a few days.

The Milton Co. are tearing up the ground at a lively rate, and have got their ditch dug around to Chalk bluff, four miles ahove Moore's Flat. At the rate they are makiag the ditch it will take but a few weeks to reach this place. One yesr from the time water is turned into the new ditch, Moore's Flat will be one of the best mining camps in the State.

A number of accideats hsve occurred here lately. Sam Blight was hurt last week in the Boeton tnnnel hy a large howlder falliug on him; but he is now up snd around ngain. Walter Wells, while down in the cañon of the Illinois claims, repsiring some flume, made a misstep and fell over a 30-ft. dump; he was all right again, however, ia a few days. Peter Hueeton, a miaer employed in the Orleans Flat mine, got his eye badly hurt. Phil. Carl got his leg badly hurt while workiug on the ditch, by a log rolling on him. Joseph Miller got his toe mashed, by a piece of rock falling on it from the top of a cut in which he was working.

Inaho.—*Tidings*, Aug. 8: The 900-ft. level is now heing opened and several levels above are turaing out good rock iu large quantities. The mschine drills coatinue to do work iu the most eatiefactory manner aad the foundation for the immense new pump will soon be laid.

Eureka.—This mine is still in su nncertain state as to its future. The ore chute which at one time rendered thia mine second to none in the State, the pitch or dip of which carried it into the Idaho grounde, plsciag that mine on the high plane it now occupies, is nearly if not qnite exhausted; and though several levele have been sunk below, no new honanza has yet been found. We underetand that a grand downward movement of two hundred feet without stopping to drift is now in progrees and very soon to be finished, when the ledge will again he thoronghly prospected and—well if good ore ie found on this level it will be a great thiag, not only for the Eureka but for the general mining interests of Grass Valley.

The Coe mine, believed to be a direct continuation of the lode upon which are the Eureka and Idaho mines, is being vigorously and at the eame time economically explored. The ehaft ie now down 500 feet and drifts runniag each on the ledge.

A pan of decomposed stuff from under the New York Hill lode where lately cut acroes, wae washed out in onr presence one day this week and full four dollars in gold the reeult. Several pans taken from near by were nearly as rich.

It pays to go after theee old abaadoned mines sometimee and prospect them with the improved appliances now extaat. The following from the North San Juan *Times* showe what resulted from one such eeekiug: "Henry Fowler of this place reports that he and a company of prospectors have made a rich etrike in the old Urisco diggings, situated near McMurray'e saw mill, on the Moore'e Flat road. From one doller to five dollars to a nan of gravel are ths resulte. These diggiags were worked eome years ago with poor resuits and were evsntually abandoned by their original owners."

PLACER COUNTY.

Mining Operations.—*Argus*, Aug. 8: A few days since through the courtesy of eneriatendent Croesmaa we had the pleasure of looking through the mines under hie charge. We found operations progressing very favorably in the Bellevae miae, end the prospects looking well. Coneidernble quantitiee of high grade ore are heing taken ont, and everythiag looke favorable for the developmeat of a first-class mine. The clean-up from the St. Patrick mill on Moaday, which is running on ore from the Bellevue, wae highly eatisfactory. The resnlt from 208 tone orushed, is 446 ouaces of gold velued at $14 an ouace, or $6,244. Thie would be a yield of $30.04 per ton, and to thie muet be added the valne of fifteen tons of high grade eulphurete from this and the previous ran, which will be shipped to San Francieco for reduction.

Mining at Gold Run.—The Englieh company which bought the old Brogan olaim st Gold Run, have been engaged in sinking a ehaft in order to teet the value of their ground, and within a few daye have reached the hed rock at a depth of 180 feet, finding abundant evidence of the richness of their claim. The company has made an arrsngement with the Gold Run mining company, for the use of their tunnel to wash through. The importsnce of the result of opening this shaft can be understood when it is remembered thst this shaft penetrates the Great Blue Gravel beds, on which the hopes of miners at Gold Run and Dutch Flat now hang, and for the working of which two coetly tunnels are being run. The extraordinary richnees of the lower bed fixes the vnlue of the blue gravel, and assures the mining future of these important towas. Were it not for the tuanel of the Gold Run mining company whioh is now being driven, this valuable bed of gravel could not be worked, aad mining would be at an end. As it now is, for the next fifty years, we may look for heavy yields of the preoions metale.

The Orleans Mine.—Mr. Gordon informs us that both the Eclipse and Green mills are etesdily poundiag away on ore from the Orleans, crushing ahout eleven tons a day. The mine is turning out a high grade of ore, and the prospect continnes of the moet favorable character.

The Eveaing Star mill on Rock creek is heing fitted up, and will in a few days start up on ore from the Auburn mine.

SAN DIEGO COUNTY

Shenandoah.—*World*, Aug. 8: Mr. Nash, who arrived yesterday from the Shenandoah mining district, reports splendid results from his ledge. He is now down 60 ft., and says the character of the ore being brought to the snrface surpaeses his most sangnine expectations. Mr. Nash will leave for San Francieco in a few days to make arrangements to purohase a 10-etamp mill and place it in immediate operatiou.

SANTA BARBARA COUNTY.

The Cinnabar Mines.—*Index*, Aug. 8: Work is progreesiag on four of the locatioas on the great cinnabar ledge in Santa Ynez valley, juet north of Santa Barbara. A shaft is down fifty feet on the Jones location, and a tunnel has been carried in 52 feet on the Barolay claim. Twenty-four feet more aud the ledge will be reached at a point 180 feet below the surface.

TULARE COUNTY.

Work in the Mines.—*Times*, Aug. 8: We are iaformed hy parties who have just returned from Mineral King district, that many companies are busily engaged in working their claims. The tunnel in the White Chief is now about 15 ft. in length; that in the Sir John Franklin about 10 ft. We were shown some specimens of rock from the latter tunnel comiag 30 ft. from the croppings of the lode. They have the sppearance of containing a high grade of ore, aad good judges eay they contain both silver and gold. Parties are aleo tunneling in the Black Wolf, Lady Alice, Lady Franklin and Salt Grsss lodes.

TUOLUMNE COUNTY.

Chappaaal Mine.—*Union Democrat*, Aug. 8: This miae, adjoining the Buchanan, bids fair to become very valuable. This week the superintendent brought down the result of 8 tons, worked in arrastra, which paid $60 to the ton, of retorted gold.

Daniel Hennessy and P. King, who have worked steadily for a long time on a quartz vein on Saw Mill flat, we learn, made a good strike on Tuesday, and have a fiae prospect ahead.

VENTURA COUNTY.

Oil Springs.—Cor. *Signal*, Aug. 8: I will give you a description of the petroleum springs discovered laet week in the northeast part of Ventura county on a branch of the Sespe creek, about twenty miles from the coast in a direct line. They are situated on the bank of a gulch, and there are within a distance of three-quarters of a mile at least 100 flowing springs, and in such quantities that it flows into the gulch where it stands in pools from one to three feet in depth. There are now at least one hundred and fifty barrels in the gulch that could be dipped up without any trouhle; and by opening the eprings the flow could be increased to at least oue hundred barrels per day. They have heen taken up and men will be put to work on them immediately.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Aug. 6: Daily yield, 300 tons of ore. The ore breaets, both north and south, on the 1,300-ft. level, are yielding ore of a fine grade, while those on the 1,400-ft. level sre openiag out richer every day. The north winze, No. 2, from the 1,300-ft. level, will connect with the 1,400-ft. level to-day, which will greatly aeeiet in the ventilation aad cooling off of that portion of the mine. A large force of workmen are employed on the new mill, snd most of the hesvy frame and sill timbers are finished ready for erection. The foundation walls ars fast approaching completion and much of the machinery ie alresdy on the ground.

Opnir.—The connection has been completed duriag the past week hetween the up-raise from the eouth drift on the 1,700-ft. level, and the winze sunk to meet it from the 1,465-ft. level, giving the long-desired ventilation of the 1,700-ft. level, cooliag it off, and enabling the commencement of preparations for cross-cutting and developing that portion of the mine. The ore breasts, on the 1,465-ft. level, contiaae to improve, while the ore hodies being prospected in both cross-cute No. 1 and the winze heing sunk from the 1,300-ft. level ehow better every dsy. At the present rate of extracting ore from the mine, a gain of 300 tone of ore in the dumpe, over the amount orushed, hse been mede during the paet three weeks.

Sutro Tunnel.—With the efficient aseistsnce of the Burleigh drills, the main-header is now progreesing nt the rate of nearly 70 ft. a week toward the Comstock lode. Length of tunnel to-day from the mouth to the face of the main header, 6,434 ft. Owing to the cooler weather of the laet few days the temperature at the face of the tuanel is conaiderably decreased, allowing the workmen to make hetter progrese than they have hitherto been able to accomplieh. The Lyon county *Times* gives the following as the indioations of the thermometer: Temperature at 12 M. header, 76 deg.; shaft No. 1, 74 deg.; mouth of tnnnel, 50¼ deg. Total length of tunnel, includiag the portion completed from the bottom of shaft No. 2, now ahandoned, 6,834 ft.

Crown Point.—Daily yield, 550 tons of ore, which is being extracted from the 1,000, 1,200, 1,300 and 1,400-ft. levels. The mine is looking haadsomely in all parts. The new incline machiaery is working succesefully, and fully meets the expectations of the Superintendent. It is calculated that its introduotion into the miae will effect a great saving in ropes and other hoisting machinery. While work in the mine was suspended by the putting-in of the new machinery, the Superintendent improved ths opportuaity by having all the various drifts put in good working condition.

Siebra Nevada.—A portion of the hoisting mschinery has been tested, and found to work with utmost smoothnees and perfection. Daily yield, 65 tons, keeping the mill steadily running. The ore-breaete in the old upper portions of the mine are looking well and yielding finely.

Florida.—New shaft down 226 ft. to-day. During the last 20 ft. the character of the rock has changed, and granite has become predominant.

Sutro.—The main west tunnel is still driven vigorously ahead, the face in hard rock, which blaets out splendidly and admite of excellent progress.

Savage.—Sinking the msin incline helow the 2,000-ft. level is making steady headway. All cross cutting and proepectiag on the 1,900-ft. level has beeu stopped for the present. Driving the main south drift on the 2,000-ft. level to connect with the north drift from the Hale & Norcrose for ventilation purposee, is being prosecuted with all the vigor possible.

Justice.—Sinking the main inoline is making good progress, the rock in the bottom working finely. The seepage of water continnee qaite strong. Work on the lower levels of the old Waller Defeat eection of the mine is again being vigorously prosecuted. Daily yield, 40 tons of ore.

Tyler.—The esst drift at the eecond-station level is sgain being driven ahead.

Leo.—The ledge is about four feet wide, and carries numerous seame and feeders of favorable looking quartz whioh will doubtlees concentrate into another good ore hody when the rock gets soft again.

Succor.—The hoisting works of the Grand shaft are again in full operatioa. Cleaning out and retimhering the shaft prsparatory to resuming sinking is nearly completed. The mill is again in full operation.

Occidental.—The east drift started to crosscut the ledge 88 feet helow the tunnel level is in 11 feet, the face in ore that assays from $24 to $27 per ton.

Daney.—There are evident indioations of a near approach to the main ledge.

Silver Hill.—The face of the main south drift at the third station is in a body of brown hard quartz of a very favorable character.

Lany Beyan.—Sinking the main shaft is making excellent headway, the bottom oeiag in a mixtare of olay, quartz and porphyry, with a considerahle flow of wster, indicating a near approach to the main ledge.

Crown Point Ravine.—The ore in the face of the main south drift on the 300-foot level ehowa much of an improvement during the week.

Buckeye.—The extraction of the ore at the eouth winze on the first station level has been commenced.

Knickebbocker.—The 600-foot station is completed and a drift started to cut snd prospect the ledge.

Mint.—The ehaft ie down 280 feet, the bottom in hard hlastiag ground.

Union Consolidaten.—Still driving north oa the 1,300-foot level of the Ophir shaft, following the west wall, and occasioaally ontting bunches of quartz of a very favorahle character.

Genesee No. 2.—Plenty of timber heing received, and work will he reeumed einking the new ehaft next week.

Caledonia.—Re-timbering a portion of the main shaft is making excellent headwsy.

Baltimoae Consolidaten.—Driving the prospectiag drifts to cnt the ledge on the 750-foot level ie making rapid progress.

Koseuth.—The new machinery ia working with the utmoet perfection, and sinking the msin ehaft has been reeumed.

Imperial-Empire.—The connection of the south drift on the 1,850-ft. level and the winze from the 1,700-ft. level wae completed two daye ago, ventilatiag the level and enabling ths commencement of croee-cute, and further prosuscting operatioas to determine the value of the ore vein. As eoon ns air was obtained, sinking a winze below the 1,850-ft. level wae oommenced, the bottom of which is still in fins ore.

Hale & Norcross.—Dsily yield, 40 tons of ore, from the old breaete on the upper levele, which show no change of interest. Sinking the main incline below the 2,000-ft. level ie making fair progress.

Belcher.—Daily yield, 450 tons, from the 1,200, 1,300 and 1,400-ft. levels. The new air ehaft is down 360 feet. The ehaft starting from the 850-ft. level to meet it is up 70 feet. Work at hoth ends is being pushed ahesd with all poseible diepatch. The temperature of the lower levels ie improving considerable of late. The various stopee and ore bresete throughout the mine are looking finely.

Bullion.—The air facilities being too poor to admit of fair progress in the north drift on the 1,700-ft. level of the Imperial shsft, the company have erected a separate blower and put in large 10-inch squsre sir boxes for conducting ths air directly to the fsce of thsir drift, thereby enabliag the workmen to now receive it freeh and cool from the eurface.

Overman.—Sinking the main shaft is progreesing at the rate of 2 ft. per day, the rock at the bottom still heiog very tough and hard blasting.

Dardanelles.—The new working shsft is down 73 ft. to-day, and timbering ie commenced. This is one of the moet important shafts heing sunk on the southern portion of the Cometock, as owing to its location it will strike the same good ore body sready developed in the Overman, and which runs into the Dardanelles.

Gould ann Curry.—The prospecting operations on the 1500-ft. level have developed nothing of value during the week. At the fourth station level a large hody of hsrren quartz hae been developed, but no ore found as yet, that will pny for extraction and milling.

Chollar Potosi.—Daily yield of ore, 100 tone, the assay value of which is $30 per ton. There is little or no change in either the looke or yield of the ore-producing sections of the mine.

Globe Consolidaten.—The ore brests above the tunnel level are looking finely. The fsoe of the north drift from the upraise is still in fine ore. The west drift from the bottom of the winze, 95 ft. from the head of the incline, is still in ore of a fine quslity, greatly resembling the genuine Cometock ores.

Pictou.—The main tuanel is now in about 480 ft., and the rook in the face ie softer at preeent than it has heen for eome weeks pset. A blacksmith ehop, csrpenter shop snd other convenient and necessary arrangements have been erected at the mouth of the tunnel.

Utah.—The flow of water from the hottom of the shaft still contiaues, although not eo strong as heretofore.

Woonville.—The crosscuts north on the 300-ft. level have developed a fine, continuous vein of pay ore 300 ft. in length. The ore body soath of the shaft is aleo opening out very favorably. It is expeoted that the Ramsdell mill will be started up on ore from this mine during the coming week.

Yellow Jacket.—The main east drift on the 1,750-ft. level ie being steadily driven toward the ore vein, the ground in the face working quite favorahle.

Julia.—The enlargement of the msin shsft is rapidly approaching completion. The pump etatioa at the 750-ft. level is nearly completed.

Dayton.—The water has been reduced 10 ft. helow the atation level, where it was first tapped, proving conclusively that the pocket has been drained.

Nevada.—The new tnnnel, to open the second level of the mine 100 ft. beneath the present good ore developments, is heing actively driven ahead.

Mining Notes in Kern County.—A correspondent from Sageland, under date of August 1st, favora us with the following items concerning mining affairs in that vicinity: The St. John ie still at work, and ie going to put up larger hoieting works in the course of a month or two. Mr. Denker is working quite lively since he started; and, as I hear, with the most satisfactory results. The Piute is working away as hard as ever. Ths machinery for the Big Blue ie arriving and will aoon be up. The Havilah tunnel is stopped, and the town is ahandoned, except by a few, who still live iu hopes of better times. The weather ie pleasant, though we had a storm a few days ago.

Quicksilver in San Luis Obispo County.

We condenee the following from the San Luie Obiepo *Tribune* of Auguet 1st, under the head of

The Cochrane Mine.

This mine is near the head-watere of the Santa Rosa creek, a dietence of about five milee from Cambria. It wae discovered a year ago, but attracted no epecial attention till qnite recently.

Dr. R. A. Cochrane, of San Francisco, came to tbis region some few monthe ago for the pnrpose of inspecting our mining intereets. He examined several mines, and selected this as being the best in the district to inveet in. He accordingly bonded tbe claim, embracing 4,500 feet, being a conecolidation of three separate locatione, for the sum of $47,000, paying $2,000 down and the balance withiu twelve months. On purchasing the claim he immediately weut to work doveloping it, and he has already demonstrated tbat he has got bis hands into one of the richest corners ever found in thie region.

Tbe mine is a vast deposit. The matrix of the ore is composed of a coerse sandstone and a conglomerate interstratified. This conglomerate ie composed prinoipally of shale and quartz pebblee cemented together by silica. The lodo can be traced superficially in length east and west from 3,000 to 4,000 feet. The main depoeit, so far as known, ie where the three olaims join, the principal work having been done there. The greateet width of the vein is 100 feet. There are two mein tunnele penetrating the hill. The ore does not lie in epots, with here and there a specimen in aight, like some mines, but there seems to be a vast body which cannot help making its possesors rich. They have already in these tunnels, backs of 75 feet and for every foot of tnnnel the backs increase a foot and a half, owing to the abruptnese of the hill.

The doctor hes good ideae of how the cinnabar got into these hills. The preeence of eand and pebbles, he argues, demonetratee that it ia an aqueous formation produced by currents. The mode of occurrence is through fumes. There are alwaye terminal springs found in connection with cinnabar. Each particular pebble in this conglomerate appeare covered with cinnabar. Small boulders—the hardest kind of flint rock—are fonnd aleo. All eround thie flint rock, on the eurface, cinnabar is deposited, it not having been able to force its way into thie hard subetance. On breaking thie mass of silica no indiceetion of cinnabar ie seen, showing that tbe fumes of vapor could not impregnate it.

Near the Cochrane mine there are several extinct hot eprings indicated. It is our opinion that thie is the moet recent formation of any mine on tbis coast. Fossil remains found there demonstrate tbis. Everything evidencee that the hill ia of comparative recent origin. Among quicksilver men the more recent the formation the better the mine ie conaidered, because there is lesa danger of internal heat to volatilize the cinnabar. There are other evidences of its recent origin than those we have referred to. From the top of the chimney to where they are now working, tbey find disseminated all throngh the mass iron pyrites, which show not the least indication of decomposition. In otber mines, ae, for inetance, the Pine Mountain region, evidently older in formation, the surface ia covered with red oxide of iron, produced by decomposition of iron pyritea.

In the Oceanic tbese iron pyrites are sometimes cubical and regular maseos, having a firm radiated structure, and even experts havo mietaken them for copper or gold.

It is Dr. Cochrane'e intention to put up a fifteen-ton furnace near the mine, in the course of a few montbe. The facilities for working the miue are excellent; plenty of wood and water being in close proximity to it. If the body of ore whioh is now in aight continues to be of the eame grade for a few hundred feet furtber in the mountaiu, it will develop a mine aecond not even to tbe Almaden, which, for twenty years, bae flooded the markets of the world with quickailver.

Argentiferous Lead Mines in Arkansas. Great exoitement haa been oreated recently by the discovery of extensive silver-beering lead depoeits in Montgomery county, Arkaneee, forty miles weet of Hot aprings. Tho vein is enclosed in a matrix of quartz, of all degrees of richneee, from ten up to sixty per cent. of gelena, or from aeven up to forty-five per cent. of metallic lead, with no contaminating metals but eilver and arsenio. It is cleseed as forty to fifty ounces silver ore. The wall rook ie hornblende elete; the ledge aeven feet in width at a depth of fifteen feet. Forty claims have already been located, ae per advices to the St. Louie *Mines, Metals and Arts* of July 23d.

Mining Machinery Removed.—The extensive machinery, batteries, etc., of tbe Banner mine, near Nevada city, have been sold, and will be removed at once and put in place at other mines—a portion will go to the Wyoming mine and the remainder to Brnce Dee's mine, upon both of whioh mills are to be erected. Both of these mining propertiee are giving every encouragement of making first-olaes mines, and tbe development which has been made upon them warrante the building of mills without further delay.

How Thermometers are Made.

A writer iu the Polytechnic *Bulletin* givee the following description of the method of making thermometers at a manufacturing establishment in Chester, Pa.:

The glass tubes, ae received, are about a yard long. A boy picks them with a bard steel knife, and breaks them into the lengths required. The bores, whioh are flat, are compared by meane of a lene with those of ten standard eizes, and the tubes assorted accordingly. They are then paeeed to the blow pipe table. Eech glass blower has a foot bellows, and ueea an oil lamp. Melting the glass at one end of the tube, he blows it into a bulb by preesing the aides of a hollow india rubber ball attached at the other, proportioning the size of his bulb to the bore of his tube, and ascertaining tbe size by using a pair of callipers. While the bulb is hot the tube is inverted in mercury, which, as the bulb cools, partially fills it. The tube is then withdrawn and a short India rubber tube attached at ite open end. Into this mercury is poured; thet iu tbe bulb is boiled to expel the air, which riees up throngh tbe mercury in the India rubber tnbe and an atmosphere of the vapor of mercnry now fills the glass tnbe and bulb. Ae this condenses, the mercury in the India rubber tube takes its place, when thie tube, with auy mercury remaining in it, ie removed. The tube is now warmed, end the open end of the glass tube is hermetically aealed.

The bulb and a portion of tube are immersed in melting ice, and the hight of the mercnry marked; they are then traneferred to a bath at 62° Fahrenheit, and the hight marked; next, to a bath of 92° and the hight marked agaiu. The length of the three apaces of 30° each are now carefully measured. If they are exactly equal, tbe bore of the tube ie aupposed to be uniform, and the degreea laid off on the brase scale of the thermometer are all made of the eame length. If the apace of 30° eaeb are not fonnd to be exactly equal, tben, by means of a highly ingenious dividing engine, the degreee on the acale are made to increase in length as the caliber of tbe tube diminishes. When the plate has been divided and tbe figures and lettere punched in, it ie passed, laterally, betweeu two rollers, to remove the burr left by the tools. Were it rolled lengthwise the accuracy of the dividing would be impaired. The plete ie then silvered and lacquered, the glass tube attached, and tbe whole slidden into the well known japanned tin case.

The East River Bridge.—Work upon the great euepension bridge between Brooklyn and New York, whicb haa been temporarily suapended, is now resumed. The Brooklyn tower has reaohed au elevation of 222 feet obove high water mark, leaving 40 feet of maaonry yet to be laid. The workmen are engaged upon the arches, several coursee of which are in position. The keystones will weigh 10 tons each, and conatitute the heaviest blocks in tbe atructure, the ordinary stonee weighing about three tons. It is expected that before winter the "saddlea" or eastings over wbich the oebles paes will be iu position. The New York tower is now 123 feet high, and will probably reach 200 feet during the present scaaon. The anchorage on the Brooklyn side is aix feet high, and containe 8,334 feet of masonry. Its total elevatiou will be 66 feet. Ou tbe New York auchorage or on tbe approaches, work hae not yet been begun.

Elasticity of Masonry.

Experiments witb a pendulum at the Bunker Hill monument have rendered the fact familiar to most readere that the eolid maeonry of tbat structure is eensibly deflected by the heat of the sun, which gives a twisting motion to the entire structure every day, commencing with the effect of the rays of the early morning sun on its easterly side, and thence the noonday heat upon its southern face, and tbe afternoon rays upon ite western side. A pendulum hung from the oenter, at tbe top, is thus made to describe a circle at the bottom dnring the day.

A very interesting observation, and one more directly involving the elasticity of masonry, has recently beon made iu connection with the testing of the great bridge recently constructed over the Mississippi river at St. Louis, which bas been deecribed by a correspondent of the *American Manufacturer* ae follows:

Tbe testing of tbe great arcb bridge over tbe Mississippi, at St. Louis, on July 2d, furnished an interesting illustretion of the perfect elasticity of masonry. The bridge has three main spans, a center span of 520 feet iu tbe clear, and two side spans of 502 feet each, with heavy stone abutments and stone piere. The system of the super-structure is tbat of the upright arch, exerting a thruet on the abutmenta and piers. It was e question of interest to the engineera making the tests, whether tbe thrnst created by tbe movable load ou one side spau would have a perceptible effect on tbe pier, and by means of a leveling inetrnment tbe crown of the arch over the midd'e apan waa observed to *rise* one-quarter inch when 14 locomotives were brougbt on the side span, and to *come back to its former elevation* as soon as the load on the eide span wae removed. Thie experiment proved that the thrust from these 14 locomotivee was sufficient to cauee a horizontal deflection of tbe pier of about one-twelftb of au inch. Thie deflectiou must have taken place iu that part of the pier extending from tbe spring of the arches down to the depth at which the pier may be conaidered firmly imbedded in the sand of tbe river bed, wbiob I eetimate at about 65 feet below the spring of the archee. Tbie pert of the pier is, ou an average, about 36 feet wide and 60 feet long, and oonsists of the very best clase of masonry, laid with large stoncs in hydraulic cement. The etone is magneeian limestone, from the quarries at Grafton, Illinois. Above low water the pier is faced with greuite.

Abandoned Yet Rich.—It very frequeutly happens that mining cleims, both quartz and gravel, are abaudoned, or allowed to remain idle for yeers, while there is plenty of gold in such abendoned or idle claims. There are hundreds of instancea of the kind in this district. The North San Juau *Times* of Saturday gives a late instance as followe: Henry Fowler of thia place reporte that he and a company of prospectors have made a rich strike in the old Urisco diggings, situated near McMurrey's aaw mill, on the Moore'a Flat road. From $1 to $5 to a pen of gravel are the resulte. These diggings were worked aome years ago with poor results, and were eventually abandoned by their original owners.—*Grass Valley Union.*

A recent invention makes it possiblo to send four messages simultaneously in opposite directions over a single telegraph wire. If four, why not 44?

A Balloon Expedition Proposed to the North Pole.

Tbe failnre of all North Pole expeditions to discover the secret of the Arctic regione hae stimulated the Aeronautic Society of Paris to attempt an Arctio balloon voyage. Extravagant ae the notion may appear, it is not more extravagant than Professor Wise's project of croesing the Atlantic ocean in a balloon. One advantage of an aerial Nortb Pole voyage ie the temperature of the Arctic regions, which prevents the escape of gas from the balloou to such a degree that it is supposed to be quite feasible to conetruct a balloon which will last a three monthe' voyage. Another advantage is the absence of darkness in the Northern regions. If the balloon leavee in the eummer time, the sun will illuminate the heavens during the whole trip. Tben, again, the permanency in the direction of the winds around the regious of the North Pole would be another point in favor of the trip to the North Pole over that across the Atlantic. Tbe size of tho proposed balloon ie fixed at about 18,000 cubic metres. It is calculated to cerry ten men, three months' provisions, apart from the ballast, a number of instruments, an anchor, and a dragging rope, which will touch the ground, should the balloon eink too near to the earth.

An ingenious arrangement hae also been made to prevent the balloon from rising higher than 800 metree, or about 2,500 feet. The boat of the balloon is to be lined with ebeepskins, and heated with lamps, eo that even if the temperature shonld fall to 32 degreee below zero, outside, it will be five degrees above zero inside. A veesel is to carry the men, the balloon, and the ingredients for the manufacture of the necessary amount of gas, to about eeventeenth degree of latitude. This will leave a trip of about 300 milee to the North Pole for the balloon to accomplish; and the voyage there and back could be made within twenty daye. Everything, however, ie to be prepared for a full three months' trip. Tbe enterpriee ie exciting unueual interest amongst the ecientific meu of Europe; and ie, indeed, one of the most wonderful echemes ever conceived by tbe human mind.

Chinese Market Scene.

Our illnstration represents a eoene in a Chinese market place. The stalls or booths of the sellere are of ratber primitive conetruction, eome of them consisting simply of rude umbrella-shaped roofe and no sides. A Chinese merchant can set himself up in businees ou a very small capital, his stock in trade being limited to a few articles, and hie warehouse portable. This may be seen by any one who takes the trouble to walk through tbe Chinese quartere of San Francisco. On Sacramento street betweeu Kearny and Dupont, for instance, one eide of the street is completely taken up by atalls of all kinds. Tbe butcher shopa are in the atores, while on the eidewalk, on the atepe, and in every possible corner, eit moon-eyed Celestiale with amall traye or baskets, offering for sale vegetables and uninviting Chinese delicacies of every deecription. In the scene shown in tbe engraving, are several cate in cages; but we have never seen any of tbeee animala for eale here. If tho tales be trne that rate are a delicacy with the heathens of tbe Flowery Kingdom, it may be that cate are a more necessary adjunct to the domestic conveniencee of theee people thau tbey are to ue; in which caee they would be marketable produce as well as anything elso.

A CHINESE MARKET SCENE.

The Old Ophir Ore Body Reappears.—On the 1,465-foot level of the Opbir mine a body of ore haa juet beon cut into, whicb containe ore precisely aimilar in appearance to that found in the early daye in the old mine. It is the eame black sulphuret ore, flecked here and there with the eame bright, goldeu-hued pyrites. Thoee who were here iu the early daya of Washoe recognize thie ore iu a moment aa being the same ae that formerly found in the lower levels of the old mine. The ore deposit aeems to have jumped from where it was lost in the old to where it has been found in the new mine. We eey "jumped," but it would more correctly describe the situation if we eaid that e huge maes of porpbyry came in between the two points and cut tbe ore off. It is expected that tbe raiee from the 1,700-foot level will be completed to-day. The moment an opening is made between the two levele nemed, their perfect ventiletion will be secured and prospecting operations may then be advantageously conducted throughout the lower aections of the mine. The new ore-body can theu be properly developed and ite ooarse and extent fully defiucd. Rich developments may be expected upon the 1,465 and 1,700-foot levels, as on both there are vaet areae which heve not yet been explored.—*Ter. Enterprise, July 31th.*

Improvement in Joining Gas Pipes.—A new method of joining gas pipes hae been perfected. Inetead of the usual projecting end, the pipes have creases or channela around them. When placed in contact, end to end, a etrip of soft lead is bound about tbem, and pressed tightly against tbe pipes by a wrought iron ring. The advanteges claimed are that the pipes are lighter and more easily cast; lesa lead is required to make tbe joint tight; no heat ie required for applying it; it is quickly done.

Useful Information.

Bleaching Bones.

The curators of the anatomical museum of the Jardin des Plantes in Paris have found that spirits of turpentine is very efficacious in removing the disagreeable odor and fatty emanations of bones or ivory, while it leaves them beautifully bleached. The articles should be exposed in the fluid for three or four days in the sun, or a little longer if in the shade. They should rest on strips of zinc, so as to be a fraction of an inch above the bottom of the glass vessel employed. The turpentine acts as an oxidizing agent, and the product of the combination is an acid liquor which sinks to the bottom, and strongly attacks the bones if they be allowed to touch it. The action of the turpentine is not confined to bones and ivory, but extends to wood of various varieties, especially beech, maple, elm and cork.

If there is any authority on the subject of preparing skulls, it would seem that if only in accordance with the external fitness of things the *Phrenological Journal* should be posted. We notice that in answer to a correspondent the editor of that journal says: The best possible way of cleaning small skulls, such as those of birds and small animals, whose skulls are very thin and not united very firmly by sutures, or cartilage, is to place them by an ant heap, one of the large ones, and in 24 hours the skeleton of a squirrel or small bird would be thoroughly cleaned of the flesh, the ants eating it entirely away. In this case, if it be not allowed to remain too long, the skeleton will be entire, the cartilages holding the bones in place while the soft parts will be all gone.

Human skulls, or skulls of large animals, may be put in a loose sack, or netting, and placed in a running stream in warm weather, and the flesh will be removed; and then the skulls may be bleached on the top of a house by the sun. Some boil the flesh off from both large and small skulls. The best, the only complete way to clean skulls entirely from all oily matter, without injuring the bone, is to submerge them in a bath of ether, contained in a glass vessel with an air-tight cover. The finest preparations are made in this way. Lime, or alkali in any form, takes all the animal matter out of bones, making them dry, brittle and chalky. A little soda, or other alkaline substance, may be applied, in solution, to skulls without seriously injuring them.

Spontaneous Combustion.—We question very much, except under the most extraordinary circumstances, whether either silk or sheep's wool is liable to spontaneous combustion, even in the process of abundance of any kind of oil. On the contrary, cotton, jute, all kinds of hemp and flax, mixed with oil, have an invariably tendency to spontaneous combustion at summer heat. All chemists well know that vegetable substances are more readily decomposed in any way than animal substances. Of course this arises from the more ready oxidation of the ternary vegetable compounds (containing only carbon, hydrogen and oxygen) than the quaternary animal compounds, consisting of the same elements combined with nitrogen. Hair, for example, will withstand decomposition for centuries, while woody fiber, even of the oak or other tree, will rarely last more than a few years if exposed to air and moisture, simply owing to the rapid oxidation of woody fiber. It is common in many of the marsh lands of England to see the pith of a willow tree catch fire spontaneously in summer time. The only apparent remedy seems that of maintaining constant ventilation in all wastes, etc., containing oil. Frequent turning is essential, and we have tried successfully the sprinkling of such waste with waste leys or lime water. It is remarkable that jute warehouses are peculiarly liable to catch fire, in fact all members of the hemp and flax family are to be more feared than varieties of cotton. —*Engineering.*

New Refractory Material.—A scientific correspondent of an Eastern paper communicates the results of some experiments made by him with silica and alumina, in which he claims to have discovered a more perfect refractory compound than any heretofore known. The mineral is reduced to an impalpable powder, and moulded and shaped by the aid of white clay. A set of stove linings was made from these mineral powders, in equal proportions with white clay, which resisted the strongest heat. A sample of the material was placed in a gas retort at Schenectady, where the heat was uniformly 3,300 degrees, and kept there for 35 consecutive days. When taken out the sample was intact, even the sharp edges showing no sign of disintegration. This is a most important discovery. If it can be practically applied, it will prove of almost incalculable value in the manufacture of iron, and in the use of stoves, furnaces and many other directions. We should like to hear how this material compares with the wonderful Pancake rock, of whose merits there is no doubt.

Glue, if kept for some time after being dissolved in water, decomposes and loses much of its strength. Those who use glue occasionally should melt no more than they need at once. Glue is also greatly weakened by being burned or too highly heated.—*Technologist.*

To Remove Ink Stains.—Pyrophosphate of soda may be used for this purpose.

Black Leading of Iron.

Mr. W. M. Williams, in a recent paper on iron, says: In these days of general diffusion of chemical knowledge, it is scarcely necessary to state that the "black lead" or "plumbago" of commerce is not lead at all, or any compound of lead, that it includes no lead whatever in its composition. Neither is it a carburet of iron, as is sometimes stated. It is simply carbon; pure plumbago is pure carbon, impure plumbago is impure carbon. Its proper name is graphite, that is, writing stone. I may venture to describe it as the softest of all solids, and have often pondered wonderingly upon the apparently unnoticed, but very curious, chemico-mechanical paradox that the hardest and softest of all the solids existing upon this earth are, chemically speaking, the same substance: graphite and the diamond, being both carbon.

It is this wonderful softness, combined with persistent solidity, that enables us to smear it over any other solid surface, and thus obtain a solid paint, all body and no medium. For the class of castings to which it is commonly applied, where its application can be readily repeated, and where it is not exposed to the direct action of water, it is unrivaled as a protecting film to iron. Its chemical action, so far as it does act when cold, is reducing or anti-oxidising. Its color and tone are so similar to iron that Mr. Ruskin himself could scarcely make any æsthetic objections to its use, and the film is so marvelously thin that it obliterates nothing. I have never met with any attempt to estimate the thickness of a well brushed film of graphite, but I suspect that, if a hundred strata of such films could be piled in contact with each other, their combined thickness would fall short of that of the thinnest gold leaf.

To Soften Hard Putty.—It is well known that common putty becomes exceedingly hard with age, which renders the removal of glass from sashes peculiarly difficult. A practical man tells us that he thinks himself lucky if he can take out one pane out of three without breakage. It is stated, however, that the putty may be softened by using a paste of caustic potassa, easily prepared by mixing the caustic alkali, or even carbonate of potash or soda, with equal parts of freshly burnt quick-lime, which has previously been sprinkled with water, so as to cause it to fall into powder. This is then mixed with water to a paste, and is spread on the putty to be softened. Where one application is not sufficient, it is repeated. In order to prevent the paste from drying too quickly, it is well to mix it with less water, adding some soft soap instead.—*Boston Journal of Chemistry.*

To Coin Collectors.—Old coins, in which letters or dates have become illegible through wear or corrosion, may oftentimes be deciphered by polishing the surface with a wheel-brush and fine emery. The reflected image, in some cases—particularly with bronze coins—will then show the figures distinctly. In a stamped coin these are darker than the rest of the disc, because the raised portions were less condensed. Numismatists have long been aware that when there has been a difficulty in deciphering a coin almost obliterated, they can frequently determine its date and character by heating it in the dark to a red heat sufficiently to make it self-luminous; the figures, though worn to the surface, having a different density, throw off more or less light, and can thus be distinguished.

To Transfer Pictures to Glass.—Engravings and lithographs may be transferred to glass as follows: Give the glass a coat of copal varnish and put aside till nearly dry, and only slightly tacky; apply the engraving face downwards on the varnish, and damp the paper with a wet sponge in order to get it to lie close to the varnish in every part; it must be again laid aside till the paper is perfectly dry; again damped with the sponge, and the whole of the paper rubbed off with the points of the fingers; washed in plenty of water to remove the particles of paper; allowed to dry hard, and finished by the application of a coat of copal varnish.

Chloral as a Preservative Agency.—M. Cuvellier lately exhibited to the Société de de Biologie, in Paris, the carcass of a dog which, after 55 days, exhibited no trace of putrefaction, although it had been kept in a laboratory in which there was a fire. The dog had been injected by the carotid with a solution of 100 grammes of chloral in a litre of water. The brain, placed in the same mixture, was also well preserved, so that it could be easily demonstrated, not having undergone the slightest appreciable alteration.

Composition for the Destruction of Bugs and their Eggs, Fleas, Etc.—This mixture, which has been patented in France, consists of 80 parts of bisulphide of carbon and 20 parts of essence of petroleum.

To free gas from naphthalin, coal tar, ammoniacal salts, particles of solid matter, etc., it is washed by passing it through water or chemical solutions in the form of bubbles or in continuous currents.

Skim-Milk Cheese.—A skim-milk cheese contains but 6 per cent. of fat, while some rich English cheeses contain 30 per cent.

Common experience has shown that the swallowing of ice instead of ice water, in hot weather, is perfectly safe.

Good Health.

The Human Frame.

No. 10—The Circulation.

The circulatory system of the human body is the great net-work of rivers and canals by means of which all parts receive their necessary cell food and send away refuse or worn out material. When we reflect that we cannot insert a fine cambric needle into our flesh without rupturing some tiny little aqueduct, and causing the blood to exude, we must be impressed with the magnitude and intricacy of this system. In a man of one hundred and fifty pounds, about 18 pounds of blood are moving all the time, up and down, in and out and through and through his tissues. These little streams never tire, never stop for a single instant during our lives.

The circulation of blood as viewed under a good microscope—in the web of a frog's foot—looks not unlike the rushing of water through a miner's sluice, which is bearing rapidly along an immense number of round boulders. Only there are millions of these sluices of different sizes and with currents of different velocities moving around, among, across and in opposite directions to each other, making a perfect labyrinth of confused regularity. The "boulders" are the blood cells; little disk-like bodies of only from one two thousand five-hundreth to one four-thousandth of an inch in diameter. They often move through capillary tubes of a less diameter than their own, and may be seen rolling, turning and impinging against the sides of the capillary walls.

But the blood is only a portion of the circulation of the body; a still larger amount of fluids passing directly through the tissues by means of secretion and re-absorption. These are the saliva, gastric juice, intestinal and pancreatic juices, and the bile. Thus in a man of the above weight there would be secreted by glands at one point and taken up by absorbents at another, of saliva, about three pounds; of gastric juice, fourteen pounds; of intestinal and pancreatic juices, one third pound; and of bile, two and one-half pounds; making a grand total of nearly twenty pounds of fluids which appear where needed and disappear when their services are no longer required, with a mysterious readiness that far excels all the wonders of magic.

Yet even this does not constitute the whole of our circulatory system. Place certain substances, either upon or under the skin and they will be very quickly seized by myriads of "police" glands, called lymphatics, and transferred to another portion of our circulatory apparatus known as the lymphatic system. The food after being digested is also taken up by one division of these glands, and with the secretions of those all over the body—which are continually occupied in tearing down and absorbing decaying tissues—is poured into the thoracic duct, and from thence into the superior vena cavæ and mingles with the blood. How infinite the power that has thus formed a fluid which contains at the same time life and death—which hurries through the system guided by a far greater than human intelligence; depositing brain food here, muscle or bone food there; receiving the products of decay at still another place to surrender them again at the natural outlets of the body; doing, as it were, millions of different commercial transactions at millions of different points, yet never committing a single error! When shall we ever completely understand our mysterious bodies?

The Sphygmograph.—People can no more be cured by the sphygmograph than by feeling their pulse or looking at their tongue. If it does them good, it is their own imagination. The sphygmograph is simply an instrument which registers the beating of the pulse in regard to velocity, intensity, regularity, etc., on a strip of paper moved by clockwork, similar to some telegraph machines. If applied to a dead man, the pencil would mark a straight line, while a living pulse will cause in the line waves of different distances, hight and shape, all in accordance with the nature of the impulse given by the heart to the circulation. The nature of the heart's action and circulation in disease, and after the use of certain medicines, may thus not only be studied, but even recorded. Life insurance companies should order their medical examiners to enter the recorded indication of the pulse of applicants for insurance, so as to have surer data to go by than is at present the case.—*Artisan.*

Sponge Retained in Stump after Amputation.—*Le Mouvement Medicale* mentions the case of a man who entered a hospital in Paris with a large granulating ulcer on the stump of his leg, consequent on amputation four months previously, in the reign of the Commune. On examination, a sponge was found in the granulations. It had been applied as a hemostatic in the amputation and carelessly left there.

Tin Capsules.—Wittstein finds that capsules used for covering wine, liquor, etc., bottles contain from 90 to 99.4 per cent. of lead; on this account they are objectionable, especially if used repeatedly, as they are liable to come in contact with the contents of the bottles, drops of which may adhere to the outside of the bottle and dissolve some lead.

Germ Theory of Disease.

Dr. Barnard, in a recent paper on the germ theory of disease, said: About 40 years ago the yeast plant was discovered by Cagniard de la Tour, and almost simultaneously by Schwann. Till that discovery, the chemical theory of disease had a strong support in the imagined analogy of fermentation. To the suggestion, after the discovery, that fermentation is probably a consequence of the rapid growth of the plant, there was at first a very general and rapid dissent; but, when, in 1843, Helmholtz made a direct experimental test of the question, by placing a fermenting liquid side by side with one of the same kind not fermenting, both being contained in the same vessel but separated by a membrane which permitted the mingling of the liquids, but prevented the passage of the plant, that analogy lost its force, for the fermenting liquid continued to ferment, while the quiescent liquid remained quiescent. The case of fermentation assumed new significance quite the contrary of that which it had before seemed to possess, and it began to be claimed quite as conclusive in favor of the germ theory, as it had before in favor of the chemical. This theory, however, though among its advocates have been, and continue to be, counted many of the most distinguished physicians and physiologists of the past and present generation, has never met with universal acceptance. Serious difficulties present themselves, which it fails to explain, among which are the objections strongly put by Dr. Bastien, that the theory demands a belief in the existence of about 20 different kinds of organisms never known in their mature state, and whose existence is not demonstrated, but simply postulated; and that these germs, if they exist, are not the germs of any known organisms, because such germs have been experimentally shown to be incapable of producing the particular diseases these are assumed to cause. Moreover, feeding on putrid flesh, as is habitual among the Kalmucks, is followed by no injurious consequences, though such flesh swarm with bacteria, and, as the author just referred to affirms, the organisms of ordinary putrefactions may be introduced even into the blood of men and animals without producing any of these specific diseases. The same writer asserts that in sheep pox the blood and the secretions are not infective, though the disease is silled to, and even more virulently contagious than human small pox.

Cocoa Nut Trepanning.—There is a well known trick performed by the clowns in pantomimes, to the mystification of the juvenile portion of the audience, which consists in shooting a hole in a man's head, and then artistically plugging up the orifice with a carrot, thus completely curing the apparently assassinated individual. While this is, of course, very ridiculous, it is no more so than a somewhat similar operation practiced by the inhabitants of Uvea, an island in the Loyalty group. These queer people have a notion that when a person gets a headache his skull is cracked, or that the bone is pressing down on the brain. Consequently they proceed to cure the trouble by cutting open the scalp, and scraping a hole in the cranium with a bit of glass, and then stopping the aperture with a piece of cocoanut shell rubbed smooth. Sometimes the surgeon scrapes too far and injures the *pia mater*, when the patient is killed; but ordinarily the boring proceeds to the *dura mater*, leaving a hole in the skull. It seems that few adults are without perforated heads, and that the cocoa nut patch is common.—*Scientific American.*

Poisoned at a Chemical Lecture.—A very tragic occurrence lately took place at Bucharest. Dr. Bernath, the principal of a public laboratory, in that city, was giving a popular lecture on chemistry. Among his hearers was a Madame Davila. The lady was taken ill in the course of the lecture, and the doctor prepared a draught for her, in which he intended to mix some quinine, but by accident used strychnine instead. The unfortunate victim was taken out into the street, and died almost instantly.

Treatment of Burns.—The New York *Medical Record* states that at the Roosevelt hospital white-lead paint has been found, after trying almost every plan of treatment hitherto proposed, to be the best and cleanest application. Mix as for painting, but considerably thicker, and apply with a brush. A very neat and satisfactory dressing in superficial burns consists in coating the surface with mucilage, and then covering it with powdered lycopodium.

Glazier's Putty as a Surgical Dressing. According to the *Medical Press and Circular*, ordinary mixed putty has been found by Mr. Couvall to be the softest and most applicable means of treating excrescences or tumors of various kinds where compression is desired, as it moulds itself so nestly to the skin. He believes it to be superior to dextrine, silicate of soda, or plaster bandages. It is cheap, and always attainable.

Chloral Hydrate and Camphor in Neuralgia.—It is said that the intimate mixture of equal parts of hydrate and camphor will produce a clear fluid which is of the greatest value as a local application in neuralgia.

The Use of Oxygen in Consumption.—This is of doubtful efficacy as a permanent remedy. It may give some relief. It is not to be lost sight of, and is worthy of trial.—*Hutchins.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Road and Farm Locomotive, 97. Chinese Market Scene, 102. Advantage of Large Wheels; Quicksilver; Gold and Silver Plating in San Francisco; Relief Map of Sierra County; Quicksilver in Del Norte County, 104. The Dismissal of Professor Carr; Improved Grape Crusher and Stemmer; The Eureka Gas Machine. 105. The Emma Mine Again; Meeting of University Board of Regents; Patents and Inventions, 108.

ILLUSTRATIONS.—Aveling & Porter's Road and Farm Locomotive and Wagons, 97. A Chinese Market Scene, 102. Eureka Gas Machine; Johnson's Grape Crusher and Stemmer, 105.

CORRESPONDENCE.—El Dorado County—Canals and Mining, 98.

MECHANICAL PROGRESS.—Writing Machine; Diver's Outfit; Microscopic; What is the Best Rail? Masts of Iron; A New Double Ship; Brick-Making Machine; Renovating Stone Fronts by a Jet of Steam, 99.

SCIENTIFIC PROGRESS.—Sun Spots; Expansion; Pyrolith; New Meat-Preserving Process; New Method of Lighting Gas; Chemistry on the Stage; Nitrogen and Plants; Fossils of the Departed; Red Coloring Matter of the Blood, 99.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 100.

MINING SUMMARY from various counties in California and Nevada, 100–101.

USEFUL INFORMATION.—Bleaching Bones; Spontaneous Combustion; New Refractory Material; Black Leading of Iron; To Soften Hard Putty; To Coin Collectors; To Transfer Pictures to Glass; Chloral as a Preservative Agency; Composition for the Destruction of Bugs and their Eggs, Fleas, Etc., 103.

GOOD HEALTH.—The Human Frame—No. 10; The Sphygmograph; Sponge Retained in Stump after Amputation; Tin Capsules; Germ Theory of Disease; Cocoanut Trepanning; Poisoned at a Chemical Lecture; Treatment of Burns; Glazier's Putty as a Surgical Dressing; Chloral Hydrate and Camphor in Neuralgia; The Use of Oxygen in Consumption, 103.

MISCELLANEOUS.—Wood Books; Cadmium Yellow; Good Run; The "Bates;" Fecundity of the Lower Animals; Practical Science as a Trainer; Advertising; The Centennial Exhibition; A Practical Argument in Favor of Cremation, 98. Quicksilver in San Luis Obispo County; Argentiferous Lead Mines in Arkansas; Mining Machinery Removed; How Thermometers are Made; The East River Bridge; Elasticity of Masonry; Abandoned, Yet Rich; A Balloon Expedition Proposed to the North Pole; The Old Ophir Ore Body Reappears; Improvement in Joining Gas Pipes, 102. Prospecting for and Assaying Quicksilver; Tri-Nitro-Glycerine; Jefferson District; Steel Rails; The Welding of Iron; Cloud-Bursts and Water-Spouts; Carson Items; Quicksilver in Sonoma County; Colorado Mining Notes; The Laughing Plant, 106. The Proposed Swap with Canada; The Largest Beam of Iron Ever Rolled, 107.

Advantage of Large Wheels.

The building of hurdy-gurdy water-wheele for high falls preeents certain obstaclea. The high apeed of the water through the pipes from great falls is ueed to greater advantage by the use of hurdy or water-wheels of larger diameters, with a gain of higher percentage of power. Of course, in the mining regions of thia coast, wherever the advantage of water power can be had, the quartz mills are always run hy water. Unfortunately, there are not many places where the mills can be run hy this power, since there eeema to be a natural perversity in quartz veins by which they locate themaelvea in rough parts of the conntry, and in positions where water is not plentiful. There are, however, qnite a number of mills in the Paoific States and Territoriea which are run by water power; either by large under or overahot wheels, or hurdy-gurdies. To thoae who live in a location where water power ie uaed, the following item, furnished us by a correspondent, may he of interest.

To illnstrate the advantage of large-aized wheels over amaller ones, where there is a high head of water, he aays: The fall of water at my mill is 100 feet. The first hnrdy waterwheel built was seven feet in diameter. Thia wheel made 160 revolutions per minute, empty. With five atampa weighing 700 pounde, with aix-inoh drop, this wheel made 56 drops per minute; with 10 atampe it made 38 drope per minute, on trial, ueing 60 inches of water, miners' measurement. The seven-foot wheel being replaced by one of 14 feet in diameter, with the aame quantity of water and seven-inch drop, it gave, on trial, 82 dropa per minute with five atamps, and 57 drops per minute with 10 stamps. It made 75 revolutions, empty, and 44 revolutiona per minute with the 10 stamps hung on. The buckets were oast at the Risdon Iron and Locomotive works, in San Francisco.

Quicksilver.

The price of quicksilver still remaina at $1.45 per pound in this market, hut is qnoted at $1.60 per pound, gold, in New York, and £22 and £23 per flask in London. Our mines here will have to be actively worked to meet the increasing demand. The product of the New Almaden haa fallen off materially, and the Redington now stande at the head of the producing minea. Only a few of the new mines are yielding quantities of any moment, though many of them are heing steadily developed. By far the largest proportion, however, of the new "minea" are simply "proapecta," and have done nothing, aa yet, to prove their worth. It takea capital to erect furnaces and work these mines properly, and the capitalists will not invest iu cinnabar nnlesa there is a very good showing made. A mere hole in the gronnd, with a few houldera ahowing oinnabar, is no inducement to them; so it has become neceaaary for the quicksilver proprietors to do a good deal of work before they can get capitalaata to even look at their claims. Theae clsima or prospects aro scattered all over the coast range from Santa Barbara to Del Norte conntiea, though a very amall number of them are entitled to the distinction of being called mines.

Several emall claims, however, are producing a few flaeks a week with retorts, which may, in a few montha, develop into good producing mines, and enconrage their owners to erect proper furnacee and work them more extensively. Until thia ia done, however, and some of the more prominent mines increase their production materially, we may expect high pricee for quicksilver. Several mines, brought prominently hefore the puhlic, such as the Borax Lake company's property, for instanoe, *promise* ua a heavy eupply in the future; bnt as yet not more than six or eight outside of the Almsden and Redington are making much of a show in iacreasing the product of the State. The Borax company's furnaces will be resdy for their first run next week, aud we ahall then see how that 70 per cent. ore pana out, of which there has heen so mnch talk. We opine, however, that their five per cent. adobes will produce more quicksilver in the long run than the 70 per cent. ore will do.

The Oakland qnicksilver mine, near the Lost Ledge, ia doing well and more retorte are being pnt np to donble the capacity. The Missouri mine ia doing well with its retorts. On the Rattlesnake mine a new Riotte and Luckhardt furnace of thirty tons capacity is being pnt up. It ia expected that with the new furnace the Sonoma mine will turn out ahortly 40 flaska per month. The Great Weetern ia a most promiaing mine and ia turning out qnicksilver every month to the value of $40,000 or $50,000. The Ida Clayton haa out some 250 tons of rich ore ready for the furnace. The Yellow Jacket is having a new furnace put up, and the Knox and Oshorn furnace for the Ida Clayton and Yellow Jacket mines ie nearly completed.

Outeide of our boundariee we learn that valnable depoeits of cinnahar have heen found in Queensland, and the Australian minera are busy in trying to make themaelvea independent of the supplies from this country and Spain. In Mexioo new discoveries have also heen made, and the claims are to be thoroughly prospected. A correspondent at Acapulco writes as follows concerning theee minea, nnder date of August 2d, 1874: In a previous letter I wrote you that the owners of the newly discovered qnicksilver mine in this State had entered into an agreement with some Mexican capitalists to keep up the price of this important material. This is fortunately not the case, hecause Governor Diego Alvarea, who, jointly with Andreas Laucedo, of thia port, owns the mine, has only taken in the millionaire Don Pio Bermijillo, of Mexico, to open the mine, to have the ores properly tested, and to form a new company open for inveetment for all who have confidence in the husiness. By last steamer a large assortment of these orea have heen sent to San Francisco, and though they are very different in appearance from the cinnabar oree which I have seen before—being mostly of a hlack, yellow and grayish appearance—your assayers will soon find out whether they are as rich in qnioksilver aa the assaya of Mr. Castillos make them appear. Under theee oirenmstancea it appeare likely to me that the owners of this mine are disposed to have the new company center at Sau Francisco, provided your capitalists shonld he disposed to take the matter in hand. Anyhow, the necessary machinery has to be imported and San Francieco will he our nearest market, as well to ohtain the needful material as for disposing of our snrplus.

THE tunnel through which the Southern Pacifio road will pass out of and into San Fernando valley, Los Angeles county, will be nearly a mile in length, and will rnn through a range of hills out of which coal oil ia conatantly oozing. Experienced oil minera are confident that the tunnel will tap so many small veine of oil that a considerable quantity of orude petroleum will run steadily from its month. One enthusiastio San Fernandoite predicts that the oil from the tunnel will flood the San Fernando valley. Certain it is that the oil is exuding from the mountain through which the tunnel must be cut.

THE shipment of bullion through the office of Wells, Fargo & Co., in Virginia City, for the month of July was $1,422,790.13.

Gold and Silver Plating in San Francisco.

The San Francisoo Plating Worka, 653 and 655 Miesion etreet, are the largeat of the clasa on this coaat. Every description of gold and ailver plating on all metals is done, hut the proprietor, E. G. Denniston, makes a specialty of silver-plated amalgamating plates for miners' use. For this pnrpoae he has a vat containing over 700 gallons of solution, so aa to be able to tnrn out platea of any required aize. The use of theee platea results in the saving of a much lsrger percentage of gold than can be obtained hy the ordinary platea, the copper and silver combined causing the quicksilver to adhere much more tenaciously to the plates and also presents a greater attraction for the gold than when copper alone ia used. The following extracta from a letter from a mining snperintendent will give aome idea of the manner of preparing the plates for nae and uaing them.

"I find that the plates which I washed first with a light solution of sulphnric acid, without the use of cyanide of potasaium, amalgamated the best. It will give you pleasure to learn that the firet, or upper lying, platee in the sluices, each of them, eave, in 24 hours, from 16 to 18 pennyweighte of hard amalgam, while copper platea in the aame place would not have aaved half of it.

I take, every 24 hours, from 15 silver plates, from 8 to 9 ouncee of hard presaed amalgam, and thie every day. The rest of the plates, (the front copper plates, ahove the silver plated platea, and eome other copper plates) give me, regnlarly, from 3 to 4 onnces more, ao that I clean np every day, from the ontside plstee of my battery, from 11 to 13 onnces of hard gold amalgam. This paya my running expenses and the contents of the batteries will be the surplus. * * * * I take the plates out once in 24 hours; take the amalgam off with a piece of India rubber—I am careful not to have any sand on the plates—brighten them again with quicksilver and lay them in the slnices. * * * * You oan nse, after the amalgam ia taken off, daily, either a wash of light sulphuric acid or a mild aolution of cyanide of potaasium, and then again charge them with quickailver, but this is not absolutely neceesary, although it cleanaee the surface so much more and the qnicksilver will adhere hetter. After you place the plates in the sluices, let them lie till next day undisturbed; but I found out by experience, thst it ie decidedly better to have the amalgam takeu off daily, just the reveree with the copper platea. The expense is saved hy getting so much more amalgam in a few weeks."

These plates are made any size, acoording to order. The copper is usually covered with about one onnce of silver to ths square foot, hut aometimes lese ia used, if desired. It takea from 17 to 24 hours to deposit one ounce of silver to the square foot of copper. Theae plates are made here, and sent all over the coast; and recently some 250 feet of copper, prepared in this manner, were sent to Japan for a quartz mill.

All descriptions of goods, including table ware, from which the silver is worn, are now replated at these works. Watches, jewelry, etc., are alao plated with gold. Over 2,000 gallona of aolution are kept constantly on hand, and six men are employed to turn out the work. These works ohtained the first premium silver medal at the last fair of the Mechanics' Institute, and a handsome display will also he made this year. Articles are plated light or heavy to suit orders, and the goods compare favorahly in beanty and finish with any prodnced in the Eastern States. Thia is another one of onr home industriee which ie turning out goode at pricee which will compete with the East.

IT ia an intereeting fact, saya the Virginia *Enterprise*, that the climate of California is a sure oure for diaeaae engendered in the climate of Nevada, *vice versa*. Our atmosphere is light and dry, while that of California, particularly near the sea coast, is heavy and moist. Nevada cures the rheumatism engendered hy the moist climate of California, while the moiat air of California cures the rheumatic dry-rot of Nevada.

THE Hepburn Iron Mining Company, which owns what is helieved to be an extensive and valuable deposit of hrown hematite ore, located in the vicinity of Doak's ranch, about six milee sontheast of Mokelumne hill, has put a force of workmen npon the ledge with a view to testing ita permanency and richness. Snfficient development has not yet been made to aettle the extent of the deposit, but the indications are wholly favorahle. The ledge shows fully 60 feet in width on top, and ore taken from any portion of it aasays 60 per cent. iron.

INFUSORIAL EARTH.—It appears strange, aaya the Virginia City *Enterprise*, that the manufacturers of giant powder and kindred explosives in California, continne to bring the infusorial earth they require in their bnsiness from Europe at great expense, when they might obtain it in this State at small cost. A few miles north of this city, near the line of the Central Pacific railroad, is an inexhauetihle bed of this peculiar earth—a bed from which car-loads of the material may be quarried at the very surface. The earth may not only be obtained in almost unlimited quantity, hut may be obtained pure and unmixed with any foreign substance. Yet this substance is brought all the way from Europe—from some place in Germany, we believe.

Relief Map of Sierra County.

We had the pleaeure of examining this week a high relief topographical map of Sierra oonnty, made and compiled by Charles W. Hendel, C. E., United States Mineral Snrveyor for California. It showa the topography of Sierra (and parts of adjoining countiea), its mountain chains and peaks, valleys, watercoureea, lakea, principal towns and mining campa, rivers, mining ditches and canals, roada and trails, etc. Also the indications of the oonrses of the ancient river beda or hlue gravel channels, and the geological formations thereof.

The map is 30 inches long by 18 inchea wide, on a scale of one and one-half milea to the inch. It ie compiled and modeled from official surveye, and gives a hetter idea of the general surface of the conuty than any ordinary map possibly could. The rosds and traile are indicated by red lines; county lines hy red dotted lines; ditches by blue lines; towns and mining camps by red squares; placer ground marked out by yellow lines. It ahowa all the gravel minea as far aa worked up to date in correct proportion, width, shape, depth and area worked, etc. A tahle accompanying the map gives the namee of all the mines, correeponding to figures in the map, and also givee the namee of towns and ditches, hights of peaks, etc. The edgea of the map are cut in section, so as to ahow the geological featurea of esch particular locality.

Altogether the map is a very handaome and useful work, reflecting great credit npon Mr. Hendel, not only for the energy displayed in collecting the necesaary data, but for the skill with which he has modeled the whole. It is appropriately colored and lettered, and is made on a correct scsle. Mr. Hendel proposes to place his map in the Mechanics' Institute Fair, so tbat the general public may form an accurate idea of the prominent featnres of Sierra county.

Quicksilver in Del Norte County.

Quicksilver is being found all over the State, and haa recently been struck in Del Norte oounty—further north than it has been found before. The location to which we refer is 30 miles from Crescent City, in Rockland district, near what is known as the Diamond copper mine. As far hack ae 1864 it was known that quicksilver existed in thia locality, and the discoverers took out some two gallons of pnre quicksilver from a depreesion in the deposit. After sinking a shaft 30 or 40 feet deep, the mine waa ahandoned, as there was an abundant supply of the metal in those days, and no excitement and high price to induce men to develop the mines.

A man who knew of the discovery at that time recently went np to the place and located the old claim. A shaft haa been sunk 30 feet deep, and some very nice ore taken ont. The quicksilver ia found in a state similar to that of the Rattlesnake mine. It appears in a soft, grayish-white rock, in small glohnles. When the earth or rock is crumhled the quicksilver can be collected eaaily. The croppings were composed of rusty-looking, yellowish rock. The wall rock ia etained with vermilion, but the main deposit is the whitish rock mentioned above. Work has been discontinued on thia claim temporarily, nntil pumps can be pnt up to free the ahaft of water. The company owning it propose to go on with work aa soon as the pnmps are in.

This is the only claim in the vicinity which has been worked. There are, howevar, excellent indications within a few miles, but they have been prospected hy no one as yet. Our informant states that they have every appearance of being good for quicksilver, bnt have not been taken np. He thinks oinnahar will he found in many places in that vicinity aa soon ae one mine is opened and proves its value.

QUARTZ ON SALMON RIVER.—A special to the *Times* from Arizona says: "A party of three of our citizens left this place this morning on a prospecting tonr to Salmon river. It is rumored that some rich quartz discoveriea have been recently made in that section, and it ia generally supposed that the party, all being scientific men, have gone to make an intelligent examination of the mines."

THE quantity of wood lodged along the banka of the Carson river ie immenee. The sudden falling of the river has left atioks stranded in all possihle shapea and placea, and men, waist deep in water, are loosening the jame and setting the wood in the cnrrent at Dayton.

A PARTY of mountaineers is being organized at Montana to explore the new Geyeer hasin southeast of Mount Washhnrn, on the head of Wind river.

THE daily shipment of ore over the Virginia and Truckee railroad to the milla on Carson river, ia from 115 to 120 car-loads, inetead of the same number of tone, aa has been reported. Aa each car oontains ahont eight tons of ore, the difference ie apparent.

SEVERAL Salt Lakers have recently discovered at the mouth of Big Cottonwood canon a eix-foot vein of Bath hrick. It possesaes great advantagea over the imported article, heing lighter, whiter and more durable.

The Dismissal of Professor Carr.

The action of the Board of Regents on Tuesday last, in the unceremonious dismissal of Professor Carr from the college of Agriculture, will, we fear, be fraught with results of much evil to the State University. The impression has gone abroad, whether justified or not, that the Regents are disinclined to give the Colleges of Agriculture and Mechanic Arts that prominence which the "Organic Act," establishing the University, designed they should occupy, and which it is the desire of a large majority of the people should be fully and honestly carried out. This impression has long been gaining strength, by reason of what may be considered, at least, as tardy action in providing facilities for agricultural and technical education, and now, by the culminating and unjustifiable act of dismissing the agricultural professor, without the assignment of any but general cause, and against the earnest entreaty of a large and respectable minority of the Board, for particular specification of reasons, and investigation into the justice of such action. It is of the *manner* in which it was done, rather than of the act, that the people complain. We do not hold that Professor Carr is the only person competent to fill the chair of special Professor of Agriculture in the University; but we do hold that under the circumstances, and in common justice, even, the Board should have acted in a more conciliatory manner.

The Board of Regents owes its very existence to the will of the people, and even the University itself is the creation of law, and is dependent for success and maintenance upon public opinion. But from the action of the Board we are reasonably led to infer that the "supremacy of the people" is entirely ignored in their plans—indeed, that they have resolved to carry out in *fact* what was merely the *suggestion* of a late writer in the *Atlantic Monthly*, that our University should throw off State interference altogether and, to use a homely but expressive phrase—paddle its own canoe. That we may not be misunderstood, we will quote the precise language—"Many persons wonder why the friends of the University of California prefer State aid *plus* State interference, rather than private generosity *minus* State interference." It would seem from the action of Tuesday that some member of the Board must have been the author of the article in question, and at the same time the ruling spirit in the Board.

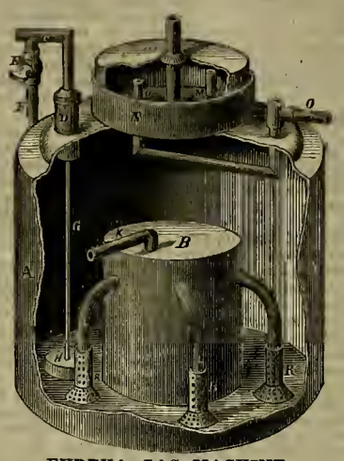
The singular and arbitrary action of the Board may possibly admit of some justification; if so they ought to make such explanation as will set them right before the people. The present is not the time nor this the place where any body of men, however high and honorable, and acting for the people, may with impunity wrap themselves up in their dignity and defy public opinion. If such action is persisted in they may find, ere long, that they have elevated their victim to the post of martyr, from which he may some day, as the head of the State Board of Education, come suddenly in to confound them in the very midst of their deliberations. This is all the more probable from the fact that no member of the College Faculty stands higher to-day before the people at large than Professor Carr—and that, too, notwithstanding the recent action of the Board of Regents. He has lectured extensively throughout the State, and wherever he has been he has secured friends for both himself and the University. We have frequently met him on such occasions, and speak of that which we know. We presume that the *people* will still find work for him to do in California, in the cause of popular education, although their servants at the State University have decided to dispense with his services there.

We are unwilling to believe that the Regents, in his removal, have intended the abolition of the Chair of Agriculture altogether; although we can scarcely realize that any man who possesses any respect for himself can accept of a chair from which he may be unceremoniously removed, without the assignment of particular cause, at the will or caprice of a body of men who pay but little deference to public opinion, and who appear to hold in very light esteem common justice and propriety between man and man.

We are far from joining in the wholesale denunciation in which some of our contemporaries of the press and many of our citizens and public bodies have indulged as to the earlier motives and acts of the Board of Regents, in regard to the Agriculture and Mechanic Arts Colleges. We do not hold that they have "totally ignored" those departments, or that they have given them only *one* professor or instructor out of the nineteen connected with the University. We fully recognize the valuable aid rendered in that direction by a majority of the professors and tutors. We freely recognize that important steps have been taken to secure the benefit of practical instruction in agriculture, in accordance with the suggestions of the very professor who has been dismissed—important, but tardy. We are aware that measures were also set on foot to secure a practical school of mechanic arts, and that those measures failed only by reason of the unfortunate and injudicious action and language of some of the honest friends of that measure—a sad result, which should teach the importance of magnanimity, and the necessity of the avoidance of hasty conclusions and hot words on either side.

We have never joined in the general denunciations of the management, by the Regents, of the agricultural lands donated by Congress to this State for the benefit of the University. We believe they have been honestly and advantageously disposed of, and their proceeds as properly invested.

We are fully aware of the difficulties encountered elsewhere in the solution of the problem of technical, and especially of agricultural education; of the disappointments, the changes and the discouragements which have been so generally met with in other parts of the Union; and we fully recognize the necessity of caution in our own case. But, with all that has been done, we fail to witness that manifestation of earnestness and interest in that direction, by the Board of Regents, which the people have a right to expect of them, considering the important position which those departments of the University are made to assume in the "Organic Act," which was, and still is, the will of the people who furnish the means, and who have elected these men to carry out their intents. So marked has been this lukewarmness that many of the University students have been emboldened to write and speak in most unmanly and unmannerly terms of efforts made on the part of the people to secure a proper recognition of practical education at the University. They have not only written and spoken, but have actually been allowed to print and circulate matter and language in relation to that subject, which one would expect to find only in journals of the lowest class in metropolitan centers—and that, so far as the public know, without reprimand from either Faculty or Regents. Such is the effect of bad example set by superiors over those who have been placed in their charge. We refer, more especially, to an article published in one of the college papers of November last, under the head of "State University Investigation." We would not like to pollute our columns with a reprint of the article.



EUREKA GAS MACHINE.

Whatever may be the equities of the case of Prof. Carr, certain it is, that under all circumstances, the people will not fail to regard the manner of the act of Tuesday last as the culmination of a "squabble," which has for a long time existed between the Regents and themselves, and which, in its manner of finality, partakes rather of personal than public considerations. In common with thousands of the more conservative portions of the masses of the people, we sincerely regret this whole matter, and believe that there has been a great wrong done to an individual and to the cause of education.

It is greatly to be feared that some of the Regents do not, and perhaps have not the leisure to devote that time to their duties in the Board which the importance of the position demands, and hence may allow themselves to be unwittingly misled by others. But we hope and trust the majority mean well; and that if they would manifest a little more candor and a reasonable consideration for public opinion and the true interests of the University, we believe they would be met more than half way by the people, in the path of reconciliation and good feeling. But if they continue to stand on their dignity, and to ignore the power that created them, the people of California will, most assuredly, have something decisive to say about the management of the University, through the next Legislature.

The water in the Carson river continues in good condition, and affords a sufficient supply for all the quartz mills. There is an immense amount of wood in the river, which is being taken out at Empire at the rate of 1,000 cords per week.

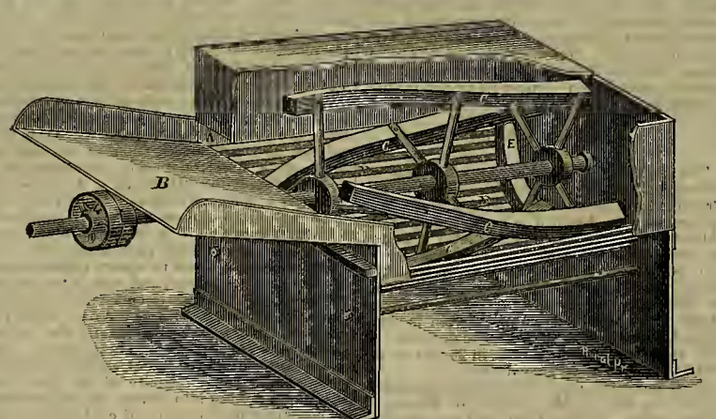
The hoisting works of the Webster mine, Nevada county, were destroyed by fire Friday night. Loss $2,200. The mine has been idle for some time, owing to litigation.

Improved Grape Crusher and Stemmer.

The accompanying illustration represents an improved grape crusher and stemmer, recently patented through the agency connected with this office, by George Johnston, of Sacramento, and William F. Johnston, of Folsom. The invention is an improvement in that class of grape crushers and stemmers in which a series of beaters are revolved inside of a box or case, the lower portion of which is formed of parallel slats. In this class of machines, as ordinarily made, the grapes are crushed in separate charges and the stems thrown out of the case after the grapes are crushed, by opening one side of the case, so as to permit the revolving arm to throw them out. The improvement in this machine consists in a peculiar construction of the case and revolving beaters, by which the grapes can be continuously fed into the machine at one end while the stems are automatically discharged from it at the opposite end.

The accompanying cut shows the machine with the cover broken away to give a side view of the interior. A shaft across the box has two or more sets of radial arms, upon which are placed the bars, *C*, so as to form spiral or screw shaped beaters. When the shaft revolves the beaters are carried around close against the faces of the slats. The grapes are fed in at the opening, *A*, from the table, *B*, and the berries are rubbed off the stems by the spiral beaters, *C*, through the grates, *D*, the juice falling into a tank placed below the machine, the stems being carried along by the spiral form of the beaters and discharged through the opening, *E*, at the opposite end of the machine. The beaters, *C*, run clear of the grates one quarter of an inch, and consequently no seeds can be broken.

The ends of the box are connected by the slats, *C*, which are so placed as to form a semi-circular trough-like box as shown. The grapes being fed into the opening, *A*, in bunches as they are picked from the vines, the rapid revolution of the beaters causes the grapes to be crushed, and separates them from the stems,



JOHNSON'S GRAPE CRUSHER AND STEMMER.

the juice and crushed grapes passing through the slats into the tank below, while the stems are thrown out through the semi-circular opening, *E*, at the end of the box.

The main features of this machine are the improvements for attaining a continuous operation. With one of these machines nine tons of grapes have been crushed and the stems automatically discharged in a thoroughly separated condition without the necessity of stopping or varying the operation of the machine. Two sizes are made, one weighing 350 pounds, which will crush and stem from 10 to 15 tons per day, with one horse, and more in proportion with two horses. The other size weighs 1,300 pounds, and will crush 60 tons per day of ten hours, if driven at the rate of 175 or 200 revolutions per minute, with one man to feed and another to take away the stems. Messrs. Lachman & Co., of this city, and the Johnston Wine and Brandy Manufacturing company, of Sacramento and Marysville, are using the large machine of this kind. For further information, address W. F. Johnston, Folsom, Sacramento county, or George Johnston, Sacramento, Cal.

There are said to be 800 paper mills in operation in the United States, with a capital invested of $40,000,000 and a total production of $70,000,000. These mills give employment nominally to 20,000 people, whose earnings are footed up at $10,000,000 annually. Last year was not a profitable one for the manufacturer,

The Eureka Gas Machine.

The accompanying illustration shows the Eureka gas machine, patent for which has been applied for through the Mining and Scientific Press Patent Agency by Lonie Marks of this city. The machine is of that class which is employed to saturate air with the light hydro-carbon oils, for the purpose of producing an illuminating gas, these machines being known as carburettors. This invention consists in an improved method of introducing the oil to the machine and regulating its flow, and also in the device for periodically stirring up the heavier portions of the fluid which have been increased in specific gravity, and utilizing them by again mixing them with the lighter portions. The air is introduced to a central drum, from which it is distributed by pipes and perforated plates, so that every part of the liquid will be made to give up its vapor and assist in saturating the air. By referring to the engraving the details of the machine may be understood. *A* is the outer or containing vessel for holding the liquid, and *B* is an interior air chamber. The outer vessel is kept filled with liquid from a reservoir, by means of a pipe, c, through which it is conducted. This pipe has two branches, one, *F*, extending down by the side of the vessel *A*, for a purpose hereinafter described, while the other opens into a valve in *D*, at the top of the chamber, *A*. A stop cock, *E*, prevents the flow of the liquid into the pipe until it is desired. The box, *D*, is provided with a valve, which closes upward. A long stem, *G*, extends downward from this valve and is provided with a float, *H*, within the containing chamber, *A*. By the operation of this float the valve is closed and the flow of liquid stopped. Whenever the chamber is filled to the desired height air is furnished to the machine by a suitable apparatus, and is conveyed from the receiver to the air chamber, *B*, by the pipe, *K*. From the top of the air chamber, pipes, *L*, lead to the bottom of the chamber, *A*, where they terminate in conical perforated or wire screens, *R*, which serve to distribute the air through the liquid so that it becomes thoroughly saturated with vapor from every part as it rises to the surface. As the air or gas rises to the top of the vessel, *A*, it is allowed to pass up through the pipe, *M*, into gasometer, *N*. From this gasometer the gas is passed out through the pipe, *O*, which is a distributing main.

As the liquid becomes relieved of its more volatile portions, it acquires a greater specific gravity, settles to the bottom and ceases to be valuable for gas-producing purposes; but can still be utilized for mixing with the more volatile portions, and occupying a portion of the space, so that it will not be necessary to introduce so much fresh liquid, as would be the case if all of this heavy portion were withdrawn. For the purpose of concentrating the heavy liquid at the bottom, the inventor employs pipes beneath the bottom of the chamber, *A*, which receive a part of this liquid as it settles. In order to stir it up and mix it thoroughly with the lighter liquid in the vessel, *A*, the stop-cock, *E*, is opened at certain periods and the fresh liquid is allowed to enter the pipe, *F*. This pipe connects with the pipes beneath the bottom of the chamber, and the current of new liquid being admitted under the heavy pressure has the effect of forcing upward all the heavy residue, and mixing it with that contained in the reservoir, *A*, above. This can be done at any time when desired or needed. For further information concerning the machine the inventor may be addressed as above.

Amador Mines.—The *Ledger* says: Reports from the developed quartz mines throughout the county are very encouraging; all continue their usual monthly yield, while lodes in process of development, as a general thing, give very flattering promise of future success. The placer mines, likewise, throughout the county are yielding satisfactory returns, and mining generally is in a healthy condition. New grounds are being located, and preparations are making for extensive prospecting as soon as water can be had. Altogether, the mining outlook throughout the county is very encouraging.

The Pacific Reduction Works, at Alameda, has been in operation for about three months, and has now commenced turning out refined silver. A lot of five bricks, said to be 995 fine, weighing 3,452½ ounces, was received from there this week. Several lots of refined silver have been received in this city before from the same source, but none of them reached such a high degree of fineness. The greater portion of the ores so far reduced have been received from Lower California and Arizona.

Under authority of the Board of Regents of the State University, Messrs. Hoffman & Craven have just issued a new edition of the map of California and Nevada, by the State Geological Survey. The map has been thoroughly revised.

Mining at Michigan Bluffs, Placer county, has been suspended for the season, the water supply having given out. The season has been fully an average one, and a great deal of gold has been taken out.

Jefferson Canon, the new mining camp near Belmont, has a population of 250 inhabitants, and building is extensively going on,

Prospecting for and Assaying Quicksilver.

Mr. H. G. Hanks writes to the *Alta* in regard to prospecting for qnicksilver as follows: "The best practical test, especially for the prospector, is to use the horn spoon, and treat the pnlverized rock as for gold. If the rock contains cinnabar an inteneely red powder, fringing the residue, will be obtained for a "prospect." If in a metsllic etate, minute globules will be the reenlt. After a few trials the prospector will feel the utmost confidence in his assays, aud will decide at a glance whether his ore contains mercury, and approximately the qnsntity. The best veesel for this assay is the "*batea*," or conical wooden bowl. [This instrnment is fully described in another columu of the present iesue.— Ens. PRESS.]

Wet Assay.

As the foregoing methods of assaying for mercury never give results absclutely correct, the aesayer mnst often practice the *wet assay* in caees where great accuracy is required. To condnct this asssy, all the appliances of an analytics! laboratory, and considerable skill in manipulating, are reqnisite.

The nsnal reduction agent is proto-chloride of tin. The mercury compound, if solid, must be digested with strong hydrochloric acid and carefnlly decanted. This process must be repeated nntil all the mercury is in solution. If tbe sclution of proto-chloride of tin is not clear, it must he made so by adding a drop or two of hydrochloric acid. The clesr solution mnst then be added to the mercury solntion in slight excess; the whole is then hoiled, bnt only for a moment, to prevent loss by volatilizstion. On cooling the meroury is fonnd in the form of a black precipitate. The supernstant liquid must then he removed with a syphon and the precipitate hoiled with dilute hydrochloric acid, which causes the mercury to form globules. It is then well washed, first with very dilute hydrochloric acid and finally with distilled wster. It is then dried, firet with bibulous paper aod then nnder a hell glass, over sulphnric acid. After which it is weigbed.

When it is necessary to estimate mercury in a solution containing nitric acid, this acid must be removed, which may be done by evaporation with hydrochloric acid. The addition of hydrochloric acid and evaporation must be continued nntil no more smell of chlorine cau be detected. It is very difficult to obtsin correct results in the presence of much nitric acid. It is best, in such a csse, to verify the results by some other method.

Purification.

Should the reader desire to obtain mercury in a state of purity, he will find no difficulty in doing so by observing the following directione.

The impure mercury mnst be distilled from an iron retort with tbe precantions alresdy described. A handful of small nsils must be pnt into the retort before putting on the cover. When all the mercury has come over, it must be dried as thoronghly as poseible with blotting-paper, after being repeatedly waehed with olean water. The distilled mercury mnst then be placed in a clean earthen dish and heated to a point not exceeding that of hoiling water, and nntil every partlole of moisture has been driven off. A filter of clean writing paper is then prepared, and fitted into a clean glass fnnnel, at the point of whioh a pin-hole has been made. Into this filter the mercury is carefully poured. It will pass through the pin-hole in a thin stream, leaving any mechanical impurity in the filter. In some cases this operation may require to be repeated. If filtered into a perfectly clean hottle, the mercury will be pure.

Reduction.

Tbe metsllurgy of mercury is more simple than that of any other metal. What has been said of the assay by sublimation, applies also to the recovery of mercnry from its ores in a large way, except that generally no re-agent is added to decompoee the sulphide of mercury.

In the great fnrnaces employed, the sulphur burns away. To explain the procese more fnlly, it may be said that the sulphnr, which is combined with the metal, oxidizes when subjected to grest heat, and the sulphurous acid so formed paeses off, leaving the mercurial vapor to condense in the capacious chambers.

Waste of Mercury.

The present high price of mercnry, cansed by the increased demand for metallurgical purposes, is a serious drawback to the mining interests of the Pacific Coset, and a loss to the world. As there is no certainty that the prodnction of mercury will be greatly increased, the miners should consider how to make the best use of what they can get. A moment's thonght will convince the intelligent reader that if there was no mechanical loss, the same mercury could be used over and over again, until the end of time, and it is well known that this loss is enormous. In all the cañone leading down from the Comstock mine, the ground is permeated with quicksilver, which has been lost, not to say thrown away, in working the ores.

If a specimen of tbe ordinary milling ore from tbe Comstock mines be examined microscopically, it will be found to coneist of certain silver minerals dispersed through a large quantity of qnartz. The proportion of quartz or silica in two samples analyzed by Mr. Arnold Hague, wae, respectively, 84 and 91 per cent. By tbe preseut proces this large proportion of worthlese matter must he saturated — so to speak — with mercury, to extract the silver from the small eilver-bearing portion. Experiments have fully shown that, owing to the greater specific gravity of the sulphurete, they msy cheaply be separatsd from the quartz. Wonld the metallurgists of Washoe subetitute a proper trestment, hssed on this general idea, and amalgamate the concentration only, the saving in mercury would be very grest.

Prices of Metals.

Althongh the price of mercury hss greatly advanced within a few years, still, oomparatively, it is not a high-priced metal. To allow the reader to oompsre it with other metals, tbe following table has been prepsred. The first five metals of the table are extremely rare, and sre only eold in minute quantities, but at ratee which would make the value of a pound as stated. It will be seen that the expression, "Worth its weight in gold," is by no means superlative.

Value Per Pound Avoirdupois.

Indium	$2,520 00	Silver	$ 18 85
Vanadium	2,520 00	Cobalt	7 75
Ruthenium	1,400 00	Calmium	5 00
Rhodium	700 00	Bismuth	3 63
Palladium	553 00	Sodium	3 20
Uranium	575 58	Nickel	2 50
Osmium	325 28	Mercury	1 35
Iridium	217 44	Antimony	36
Gold	301 45	Tin	33
Platinum	115 20	Copper	25
Thallium	108 77	Arsenic	15
Chromium	58 00	Zinc	10½
Magoesium	46 50	Lead	07
Potassium	23 00	Iron	0.021

Tri-Nitro-Glycerine.

This title is given by Mr. Mowbray to the glycerine made by his processes, and appears to be chosen to indicate the purity of the product, since all nitro-glycerine is a tri-nitro-glycerine, the impurities having a different compoeition. The conditions of making pure glycerine may be etated as follows: Nitro-glycerine is produced by the action of an extremely cold mixture of sulphuric and nitric acids on pure glycerine. The stronger and purer the materials the better will be the product; the glycerine mnst be dry and the acids must be as strong as they can he msde. The heat caused by chemicsl action is carried off hy a stream of oold air hlown into the acid mixture during the sdditiou of the glycerine, but mainly by externsl cooling with ice. The current of air insures a thorough contact of the glycerine with the acids. The oily product obtained is put into earthenware jars holdiog 60 pounds, and kept at a temperature of 70 degrees Fahreuheit for three daye. Tbus refined, it is ruu ioto equare tin cans holding 56 pounds.

Under these couditions the product is a colorless oily liquid of a epecific gravity of 1.6 at 60 degrees Fahrenheit; it has no odor, bnt an aromatio taste. A drop of it on the tongue causes a severe but transient headache. When the nitro-glycerine is quite pure and fresh the miners experience no distress from the gasee generated hy its explosioo, and the liability to explode or decompose spcutaneously is very small. But it seems certain that the pnrest nitro-glycerine will eventually decompose, as it is unstahle at slightly raised temperaturee, even when firet made. Decomposition eeems to increase the liahility to explosion, hence the absolute prohibition against its transportation in Europe.

Jefferson District.

The Belmont *Courier*, of August 1, has the following items in regard to this district: The Prussian mine is showing wonderfully rich ore, and ere long is destined to become very valueable property. In the 100-foot level a drift is in south from the main incline a distanoe of 125 feet. Assays from the face of the drift show from $131 to $2,200 per ton, the ore being in character very similar to that of the Comstook. Two feet in width of the vein is beiog sacked, the ore being of such a high grade. A drift in tho same direction is in 25 feet on the 200-foot level, showing good ore.

Geo. Nicholl showed us an assay hutton forwarded to him by Mr. Centras, of Empire or Tybo mioing district, from half an ounce of pulp from the Sclavonian Chief mine, whioh yields at the rate of $20,786 01 per ton. We also saw three certificates of assay made by him a few days ago from the same mine, brought to town by J. C. Baker. The results were as follows: No. 1, $6,273.50; No. 2, $1,279.69; No. 3, $299.33.

The town of Jefferson ie becomiug a place of coneiderable note. Straogers are hieing thither in considerable nnmhers, and many new buildings are in the conree of construction. Messrs. Dayton & Co. are erecting a stoue house to he used as a store. The arrival of sixteen mule teame from Wadsworth with lumber, is of almost daily occurrence. The mines are said to be improviog steadily as depth is attained.

STEEL RAILS.—The Central Pacific Railroad Company is experimentiog extensively with steel rails at various poiots between Emigraut Gap and Truckee. They have already about eixteen miles of the rails laid down across the Sierras. In front of the Truckee Hotel, about a year ago, they laid down a steel rail ou the main track, in place of the common rails in use. As nearly all the ewitching and making up of trains takes plaoe in front of the hotel, on the track mentioned, the wear and tear of the rails is enormous. Frequently trains paee over the spot from fifty to a hundred times a day. Since the steel rail has been laid down, the common iron ones have been taken up and replaced with new ones five timee, and the steel rail ie still in good serviceable condition. We nnderstand that twenty miles more of steel rails will be laid down this snmmer and fall across the Sierras.—*Truckee Republican.*

The Welding of Iron.

When two pieces of ice are rubbed against each other, fueion takes place between the surfaces of contact, at a temperature helow zero. As soon as the presenre ceaees, solidification is again produced and the pieces are weldod together.

It seeme to me thst the welding of iron is a phenomenon exactly similsr. The two pieces of iron are brought to a white heat, that is to say, more or less near to the fnsing point. The repeated blows of the hammer, or the pressnre of the rolls, lowers the point of fueion and canses a superficial liquification of the parts in contact, and thus welds the masses together; and thie, because, like water, iron dilatee in passing from the liquid to the solid state. Many other metals are similarly endowed; they all therefore may be welded like irou, if other conditions do not come in to oppose the manifestation of this property. Platinnm welds easily at a white heat, because its non-oxidizable surface, like ice, takes on a superficial fusion. To weld iron successfully, it is necessary that its surface should be clean, that is, free from oxide. Iron conteining phosphorus welds more easily than pure irou, becanse ite point of fusion is lower. Steel, which is more fusible etill, welds at a lower temperature than iron, but the process is a more delicate one. Silver, too, like iron and platinum, has the pronerty of expsnding when it solidifies; hnt as it melts at a cherry red heat, it is easier to form by casting than by welding. Bismuth and zinc are alwsys included in the same claes; but they are so very brittle near the fnsing points that no one would think of attempting to weld them by hsmmering or pressure. Irou, in welding, therefore, only follows the example of water.

The fibrons stste of iron ie not a mornal and regular one. All crystalline iroo, if the crystals are not too hard, breaks with a fibrous structure, if time be giveo in the brenking, for these crystals to be drawn out into fihers. Iron which is fibrons is only iron in which the primitive crystals, enrrounded by very thin films of slag—and thus separated from each other—have not heen welded together duriug the rolling, but have heen elongated into wires. A bar of such iron resembles a bundle of wire in its resistance to fracture, but it breaks with a granular fracture when exposed to a transverse blow, suddenly applicd.—*M. Jordan.*

Cloud-Bursts and Water-Spouts.

The Gold Hill *News* makes the following very oorrect distinotiou between these two classes of phenomena: Many of our oontemporaries seem to he under the impression that cloud-bursts and water-spouts are one and the same thing. Our own observation aud experience of them during several years' residence in this State, as well as comparing notes in the experience of others, inducee the helief that, although the phenomenal effects of each are very similar, yet there is a decided differenoe in their source aud formation. Water-spouts are met with on the ocean or on broad surfaces of water, whose huge moving columns of water are whirled up from the sea to the clouds, nnd whenever this column of water breaks, whether on land or upon some unfortunate ship, it descends in a body overwhelming all beneath it. A cloud-burst is simply a moet extraordinary shower or pouring down of rain—an ovsrladen cloud suddenly letting go its contents by the run. The hesvy, porteutoue clond may pass along over the earth, showering down its watery contente generously as it goes along, and were it to meet no obstacle or changing circumstsnce, notbiog unusual might come of it. At or about the heads of gulches or cañons among the mountain tops is where the cloud-burst occure. The cause may be looked for in sudden electrical disturhances, the electricity of the earth and the cloud comiug into coutaot or conjunction, or perhaps a huge current of cold air met with at that point may produce the reenlt. Be that as it may, the observer will simply notice a sudden aud furiously copious ehower or pouring down of raiu, and no definite body or column of water as in the case of a water-epout. The eteep hillsidee will he directly covered with flowing sheets of water rushing from all directions into the bed of the ravine, forming a great flood which sweeps along logs, brush, rocks and every loose thing it can gather in ite course, and thus driving along a huge front wall, as it were, of all sorts of debris seethiog with angrily foaming water, sweeping everything movable before it, and spresding ruin and devastation in its course. The flood-gates of the upper regions seem to open and the rain descende more in actual streams than drops. The watery composition of the cloud seeme to condense all at once, and the name of "cloud-burst" is peculiarly applicable.

CARSON ITEMS.—In the *Tribune*, of August 1, we find mining items concerning Esgle valley: A quantity of rock from the North Carson mine was sent up to Colonel C. C. Stevenson's mill for reductioo. Every possihle test has been made of the ore and with splendid results. It is a well conceded fact that good ledges exist in the immediate neighberhood of Carson. So, hurrah for Eagle valley, the oasis of the great basin. A party left town this morning armed with picks, shovels and sluice boxes. In the direction of the scene of the cloudburst they went, and from what we gleaned have struck a gravel lead that is nearly if not quite pure gold. The party were provided with flour sacks in which to pnt their gold after panning.

Quicksilver in Sonoma County.

We condenee the following from the Sonoma *Democrat* of Ang. 1et: So many discoveries of cinnabar in this section have been rsported that the people have got confused about it. We propose to give an nnexsggerated statement of those mines in and near the line of this county which are now prodncing or erecting works for the production of metsl.

First in order is the "Great Western" mine, sitnated on the Lake county side of the ridge which separates this and Lake county, a few miles north of the St. Helena mountain. The company have a patent for their mine and 2,600 acres for timber land around it. A ten-ton furnace has been for some time in operation and another of 30 tons capacity, with six iron condensers, ie just completed. The mine has been producing abont 100 flasks of quickeilver a month; the new furnace will swell the product to 400. Two tunnels have been run from opposite eides to the center of the hill—they are connected with a shaft 70 feet deep. From the shaft parallele have been run and the ore is taken out through the tunnel on the east side of the hill just above the reduction works. A tunnel has been commeuced below the works to run 1,600 feet, the whole length of the mine. The ore will be taken through this tunnel from above and from side drifts. The rock is soft; much of it crumbles and ie made into sdobes; it is very rich in mercnry. There is 1,500 feet of tunneling altogether, splendidly timbered. The mine is 25 miles from Santa Rosa.

The Ida Clayton, on the opposite side of the hill from the Great Western, is heiog actively worked. The site has been chosen and the bricks are on hand for the immediate erection of a furnace. About three miles north is the American mine. A ten-stamp mill and retort, with 12 condensers and a capacity of 10 tons a day, has just been completed.

In Pine Flat mountain, just beyond, an English compsny are prospecting a nnmber of locations. The next productive mine is the Sonoma, beyond Pine flat. Here a splendid Luchardt furnace has been st work for the past six months. The Superintendent, Mr. Clark, has been working surface earth and float rock of a low grade, producing about 30 flasks of metal a month; meanwhile he hss run a tunnel into the hill. Next, we have the Rattlesnake, where au immense amount of work has been done. The location for a furnace has been graded, the brick is on hand, and a large amount of ore is on the dump, carrying free metal, se rich as thst which characterized the mine on its first discovery. At the Missouri mine work has been psrtially suepended—the suit now pendiug having pnt a damper upon enterpriee in that direction. On the Oaklsnd, next heyond, work ie rapidly progreseiug. Lsst week the richest deposit of ore yet found in the district was struck in the iocline at the Oakland. The product of the small retort was doubled. Their yield this week will not fall ehort of 20 flasks. The Keutuck ie taking out ore which is reduced at the Miesouri retorts. Across Sulphur creek the Cloverdale mining company is building a furnace. We hear very favorable reports from the miues in the vicinity of the town of Cloverdale, of which R. & J. Crsig, of San Francisco, sre owners. It is probable that a furnace will soon be erected in that vicinity.

COLORADO MINING NOTES.—We glean the following Clear Creek county mining notes from the Georgetown *Miner* of Aug. 1: Mining is going on very actively all over the district. Several leases has been let the past week, and several new workings have been reported. A very rich body of ore, fine grained galena carrying over 300 ounces of silver, has been struck in Smith's shaft oo the Gates. The ore is full of gray copper and ruby. Frothiogham & Marshall, working on the Clift lode on Democrat mountain, have struck a fine body of ore at the depth of over 200 feet. This mine yielded well some time ago, being nn old discovery, but of late has not been worked much. It will now probably take rank among our good producing mines. Mr. Millspangh, of West Argentine, informs us that 180 pounds of ore brought down from the Brooklyn lode, in that district, brought the handeome eum of $43 at the mill. This mine is coneidered a very fine one, and promises to be one of the first-class mines of the couuty when developed. We have just seen a report upon ores sold from the Baker mine, in West Argentioe, which speaks well for the old mine. The lot of ore oompriced 37 eacks first-class, at 240 ozs.; 54 sacks eecond-class, at 118 ozs.; and 25 eacks second-class, at 106 ozs. Tbis mine, with tbe present development, will yield three tons of ore per week right along, and every week's work upon it will be increasing its ore-producing capacity.

THE LAUGHING PLANT.—In Palgrave's works on Central and Eastern Arabia, we read of a plant whose seeds produce effects eimilar to those of laughing gas. It is a native of Arabia. The seed pods are soft and woolly in texture, and contain two or three black seeds of the eize and ehape of a French bean. These seeds when pulverized and taken in small doses operate upon a person in a most peculiar manner. He begins to laugh loudly, boisterously; then he sings, dances and cuts all manner of fantastic capers. The effect contioues for about an hour, and the patient ie uproeriously comical. When the excitement ceases, the exhausted exhibitor for an hour or more sleeps, and when he awakes he is utterly unconscious that any such demoustrations have been enacted by him.

The Proposed Swap with Canada.

The best argument against the adoption of the so-called reciprocity treaty between the United States and Canada appears in the form of a cartoon in the *Daily Graphic*. The picture represents Uncle Sam offering to shake hands with the half-reluctant Cannck, saying: "Suppose we agree to swap again. I got riled at you during 'the late unpleasantness,'" and concluding with a degree of stupidity of which no Yankee was ever guilty; "but we will both profit by trading even." The cartoon surrounds the innocent (?) Canadian with pine forests, sawlogs, boards, ears of corn and strings of fish; while Brother Jonathan has stacked about his traditionary lank figure, clocks and watches, boots and shoes, hats and stockings, spades and hammers, knives, forks and spoons, tobacco, wagon wheels, lard oil, and sugar-cured hams. It will occur to the average American mind that we have sawlogs, pine boards and ears of corn enough of our own, and consequently don't particularly need to import those articles from Canada; and everybody who knows anything about the St. Lawrence fisheries knows that American fishermen get along very well outside the shore line. It follows that the innocent Canadian of the cartoon holds back from shaking hands with Uncle Sam out of a sense of shame for the beggarly show he makes as an offer of reciprocity. On the other hand, the magnificent display of American goods required by Canada, by which Brother Jonathan is surrounded, gives the lie to the language—"but we will both profit by trading even."—*Interocean*.

THE LARGEST BEAM OF IRON EVER ROLLED. Among the many branches of industry and enterprise, in our thriving city, there are few more deserving of mention than that of the Union Iron Company, now in successful operation. Through the courtesy of the president of the company, we were invited to witness a triumph of enterprise, of which few of our citizens are aware that we can boast, viz., that of rolling the largest and heaviest 15-inch beam ever rolled here or elsewhere. The "beam pile" when charged into the heating furnace was 13 feet 6 inches in length, weighing 3,800 pounds, and made when rolled a 15-inch beam, 52 feet long, weighing 200 pounds to the yard, or a total weight of 3,467¾ pounds. The pile was drawn from the furnace, was passed nine times through the rolls, and afterwards cut and "hot straightened" in five and a half minutes. The train on which this heavy work was performed is what is known as a "three-high," the rolls being 21 inches in diameter, and driven by a "condensing engine" of 45 inches in diameter of cylinder and 30 inches of stroke. Within a few days a light 15-inch beam (150 pounds to the yard) of a length greater than the above will be rolled, and being invited to witness the operation we shall take pleasure in informing our readers of the result. The great ease and dispach with which this work is performed is truly wonderful.—*Buffalo Express*.

Certificate of Partnership.

We certify that we constitute a partnership, transacting the business of Printing in this State; its principal place of business is San Francisco, California; its name is SPAULDING & BARTO. The full names and respective places of residence of all its members are signed hereto.

Dated San Francisco, Aug. 5th, 1874.

GEORGE SPAULDING,
HARRISON BARTO.

Indorsed. Filed Aug. 5th, 1874.

WM. HARNEY, County Clerk.

ARE YOU GOING TO PAINT?

THEN USE THE BEST.

THE AVERILL CHEMICAL PAINT

WILL LAST THREE TIMES AS LONG as the best lead and oil, without CHALKING; is of any desired color. It is prepared for immediate application, requiring no Oil, Thinner or Drier, and does not spoil by standing any length of time. It is equally as good for inside as outside work; over old work as well as new; in fact, where any paint can be used the AVERILL CHEMICAL PAINT will be found superior to any other. Any one can apply it who can use a brush, which truly makes it the FARMER'S FRIEND.

IT IS JUST THE PAINT FOR THE AGE.

IT IS SOLD BY THE GALLON ONLY.

One gallon covers 20 square yards 2 coats.

For further information send for sample card and price list.

MANUFACTURED BY

The California Chemical Paint Company.

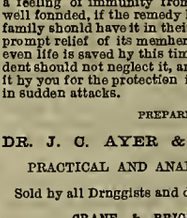
Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.



The few compositions, which have won the confidence of mankind and become household words, among not only one, but many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as AYER'S CHERRY PECTORAL. It has been known to the public about forty years, by a long continued series of marvellous cures, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the CHERRY PECTORAL has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy be taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

The Emma Mine Again.

The famous Emma mine seems destined to hecome still more famous before the English shareholders get through with it. A reliable hietory in detail of all the affaire connected with this mine would be au interesting document for the mining public, though probably many of the English people wish they had never heard the name of the mine. The directors of the company have issued the following circular, which we append as a matter of interest:

LONUON, July 10, 1874.

To the Shareholders of the Emma Mining Company (limited): The Directors have the pleasure to inform you that the result of the poll demsnded by Mr. McDougall ou the 9th of Jnne, for the election of a Director, was as follows: For Mr. Hutton, 20,100; for Mr. McDougall, 10,746. With regsrd to the complaint made hy Mr. McDougall in a circular, as to keeping open the transfer books, psndiug the adjournment for the poll to be taken, the Directors call the attention of the shsreholdere to Section 18 of the Articles of Association, which compel the transfer books not to be closed for a period longer than thirty days in any one year; therefore, as that time had expired, they had no other alternative but to keep them open.

The Directors further observe, as to the proposed meeting to be called by holders of 10,000 sharee to transfer all the power and authority of the compauy to Mr. McDougall, or any other person—the Board simply observe that no such meeting can hand over to any person the authority or property of the compauy, and, even if this were possible, the preeent moment would be most inopportune and disastrous to the interests of the company, inasmuch ss the Directors have already, under the advice of eminent counsel, commenced proceedinge in America against all parties who, in the opinion of counsel, are in auy wsy liable to the company for their dealings in oonnection with the purchase of the miue, or their subseqneut transactions, and they have decided to refuse paymeut of any further moneys on account of Mr. Park's claim against the company. The Directors are determined to prosecute these proceedings, and believe the ahareholdera will have confidence in their power to conduct the same to a successful isene; any interference now will be fatal to the interests of the company. By order, W. H. TOOKE, Sco'y.

The suit epoken of has been instituted in New York city, aud we shall probably now learn in detsil more about the matters connected with the eale of the mine. So many prominent men were mixed up in the buainess at the beginning, that the general public will be pleased to learn exactly how muoh each of these gentlemen made out of the sale. The miue certainly advanced in price wonderfully between the original vendors and the iucorporated company. It would be well for the public to know exaotly how the eale was manaaed, and by what process the mine grew eo valuable in a ehort time. Whether those geutlemen who have received auch a large share of abuse will prove their innooence in thie trial, remaius to be eeen; but at all evente, if innocent, they must be rejoiced at a chance to clear themselvea of the wholesale accusations made againet them. Not only the English but the American public are interested in the result of the forthcoming trial, for there is little doubt that if the Americane perpetrated any frand, they had English associates to assist them.

THE Union Iron Works, of Ssoramento, employ at present 40 men, and are engaged ou the iron work for the court houses for Freeno and Tulare connties, which will require 60 tons of iron. They are also turning out the iron work for the Sacramento Smelting company. A great quantity of general jobbing ie being done. The buildings belonging to those wcrks cover a epace of 18,000 square feet and are two etoriee high, with a baseeut. Messrs. Root, Neileon & Co., are proprietors.

THE Santa Barbara *Index* states that work is progressing on four of the locations on the great cinnabar ledge in Ssnta Ynez valley, juet north of Sants Barbara. A shaft is down fifty feet on the Jonee location, and a tunnel hae been carried in fifty-two feet on the Barclay claim. Twenty-four feet more and the ledge will be reached, at a point 180 feet below the surface.

WOAK on the large tunnels near Dutch Flat —one emptying into Bear river, and the other into the American river—is being forced ahead with all poseible dispatch. When completed they will cost abont $100,000 each, and will afford an outlet to au auriferous gravel bed of about 400 acree, averaging, perhaps, 200 feet in depth.

THE famous "Stevens' Bsttery," now lying in the dry dock at Hoboken, is for sale. The Commiseiou having the vessel in charge have issued a pamphlet giving a detailed description of the vessel, with appropriate drawinge, etc. The representatives of four foreign governments have examined the vessel with a view to purchase.

RICH placer mines have been discovered 75 miles from Elko, near the old San Bruno mining camp.

THE Napa Plow Co. is now fully under way. Twenty-eeven skilled mechanics are employed.

Meeting of the University Board of Regents.

The Regents of the University held a specisl meeting on Tuesday last to take into consideration the question of Professor Csrr's further incumbency of the Agricultural Chair. Nearly all the Regents were present—a fact doubtless due to the importsnce of the action proposed. A resolntion was offered wherein the Secretary of the Board was instructed to notify the Professor that his eervices would be hereafter dispensed with on the general gronnd of unfitness. Some discussion followed by Regents Felton, Dwinelle, Hamilton, Estee, Hallidie and others. During this discussion Regent Hamilton enbmitted the resolutions of a Joint Committee of the State Grange, Mechanics' State Council and Mechanics' Deliberative Aseembly, which were read and referred to the Advisory Committee to reply to.

Resolution of Inquiry Defeated.

Mr. Hallidie offered the following substitute for the first resolution:

Resolved, That the Advisory Committee is hereby requested to examine into and report to this Board any irregularities, insufficiencies or incompetencies that may exist, or may have existed in the administration of any department of instruction in the Uuiversity, and if in ite opinion any ohanges shonld be made. The committee is empowered to add to itself any additioual members of the Board; to hold its sessions with open doors, or otherwise, and to adopt such measures to further the public interest, as their judgement may dictate or suggest, and report the faots to the Board.

The substitute was lost by a tie vote.

Prof. Carr Removed.

The originsl resolution was then carried by the following vote:

Ayes—Regents, Booth, Mills, Winans, Stebbins, Archer, Martin, McKee, Swift, Moss, Ralston and Haight.

Noes—Regents Estee, Hallidie, Dwinelle, Sachs, Felton and Hamilton.

Excused—Regent Hager. Absent—Regents Pacheco, Bolander, Carey, Bowie and Gilman.

A resolution was then offered that a committee of three be appointed to coneider and recommend the name of a suitable pereon to fill the chair of Professor of Agrioulture. The chsirman appointed Regents Stebbins, Hamilton and Haight to this committee.

After some further minor hueiness the Board adjourned. Some editorial oomments on the remarkable action of this meeting will be found in another column.

SAYS the Trinity *Journal:* "Quartz on the brain" has taken twenty-five men to the summit of Bullychop mountain. Several lodes have been discovered, and all prospect well. A etore and saloon have been eatablished, and Bullychop bids fair to rival Mt. Davidson.

THE CAOUOH ENGINE.—Four more of the patent system of superheated steam engines arrived at San Jose by the C. P. R. R. freight last Saturday evening. They make six already received. They are consigned to S. A. Bishop, and will be used in harveeting.

THE difficulty between the Union Pacific Co. and the coal dealere and owners of coal beds has been settled, or rather an arrangement has been msde by which Summit county coal can again be brought over the Union Pacific rsilroad.

WM. M. KILDUFF, for 23 years chief eugineer in the employ of the Pacific Mail Steamship Company, recently reeigned his poaition, and is now master mechanic of the San Francisco and Northern Pacific Railroad.

AT Red Dog, Nevada county, an Englieh company are driving a tunnel which will afford an outlet for a large number of gravel clsims known to be rich, and on ita completion lively times are expected.

Now that the Sierra Nevsda company are working their hydraulic mine, there ie more water running down Six-mile cañon than the millmen down that way care to see. It spoils the business of saving tailiugs.

CLARENCE KING, Director of the United Ststes Geological Survey, of the 40th parallel, and well known on thie coast, has been elected a Fellow of the Geological Society of London.

OSMIRIDIUM.—It is reported thst the rare mineral called osmiridium, an alloy of the two metsle oemium and iridium, hss been discovered in Gippsland, in the Colony of Victoria.

A NUMBER of proepecting parties from Los Angeles, well equipped and compoeed of experienced miners, are eugaged in exploring the adjacent mountains for the precious metals.

Two hundred and ten thousand cigars and twenty thoneand pounds of emoking tobacco were ehipped East from the Gilroy worke on Friday last.

SEVERAL veins have been taken np quite recently, aud the prospecte are favorable for an extensive paying district in Cathay valley, Mariposa county.

RETURNEU Piochers denounce the Stickeen mines as a etupendoue frand.

THERE will be more claime opened aloug the Klamath this year than there were last.

The Ninth Industrial Exhibition.

Matters connected with the approaching Mechanics' Institute fair are progressing favorably, and on Tuesday next the exhibitiou will be opened. Dr. W. A. Scott has accepted the invitatiou to act as Chaplain, and deliver the opening prayer. Seventy-five piecee of mnsic have been engaged for the opening exercises, and there will be 500 adults and 2,000 children join in the grand chorus and other pieces which have been selected. A card has been sent by L. P. McCarty, Chorus Manager, to the different musical societies in the city, inviting them to participste in the choral exerciese. The vocal mnsio will be accompanied with an orchestra, the choruses to be sung being, "Thanke be to God," from Elijah, and "Hallelujah Chorus," from the Messiah.

The bnildiug is fast beiug decorated and fitted up, aud applications for space continue to come in. Messrs. Fink, the gentlemen who eecnred the contract for the gas illuminatiou, have placed in poeition 208 30-inch reflectors of 10 burners each, and 18 84-inch reflectors of 56 burners each, at a cost of $8,000. There are 3,088 burners in the building, and the oost of lighting np each evening will amount to about $100. The coast connties will be specially favored dnring the continuance of the exhibition, by the Pacific Mail Co. and Goodall, Nelsou & Perkins issuing tickets at half price. Articles for exhibition will be traneported at one-half the nsual freight. Very few artioles have, as yet, been placed in their proper positions; bnt all is bustle and activity in the pavilion, and everythiug ie being etraightened as fast as possible. The art exhibition promises to be good, ae doee that in the machinery department. Altogether, it is anticipated that this fair will eclipse all former efforts of the Mechanics' Institute.

It is expected tbat the horticultursl display at the approaching exhibition will be an exceedingly fine one, the Bay Dietrict Horticultural Society having combined with the Mechsnics' Inetitute in getting up the fsir. This will undoubtedly excel all industrial expositions that have hitherto been given on this Coast. Science and art, mechanism and horticulture will here be enabled to exhibit themselves to the best advantage. The managerial machinery is running effectively, but noieelessly, and exhibitors are busy with their preparatione. The fair opene on Tueaday of next week, and iu the next issue of the Paess we shall probably be able to give our readere a general idea of tbe exhibition.

General News.

STATE INDUSTAIAL FAIRE.—The Ohio State Fair will be held at Columbus, September 7. The Northern Ohio Fair, at Cleveland, will be held a week later, partaking more of the character of an industrial exposition. An effort ie being msde to organize a Southern Ohio Fair Association, to hold a fair at Dayton. Tbe Indiana State Fair and Exposition will open at Indianapolis September 7, and hold thirty days. The Illinois State Fair will be held at Peoria, September 14 to 19. Iowa, at Keokuk, September 21 to 26. Kaneas, at Leavenworth, September 7 to 11. Wisconsin, at Milwaukee, September 7 to 12. Wisconein Indnetrial Aseociation, at Mineral Point, September 1 to 4. Minnesota, at St. Paul, September 8 to 12. Nebrsska, at Omaha, September 29 to October 2. Colorado, at Denver, September 22 to 26. Califorinia, at Sscramento, September 21 to 26. Michigan, at East Saginaw, September 14 to 19. The Industrial Exposition at Chicago will open September 9 and continue one month.

THE WRECK OF THE "GUATEMALA."—A letter from the wrecked steamer says: Some ten tone of freight was thrown overboard after the veesel struck, with a view to lighten her, but as this did no good, they discontinned the throwing over of the cargo, and some 370 tons were saved by the wreckers in pretty good condition. The "Guatemala" firet struck under the bow, which knocked a hole in her. After ward she was pushed forward by the sea, nntil ehe lay on the rocks underneath the engines, where she now hae a large hole, and is firmly embedded in the rocks, witn 15 feet of water in her. There is no possible ohance of her being floated, but there may be some chance of stripping the ship. The "Guatemala's" water compartments were ueeless. The firemen and engineers remained manfully to their duty, in water up to their necks, nntil ordered by the chief engineer to leave the fires.

ESCAPE OF MAASHAL BAZAINE.—There is great excitement in Parie, in consequence of the escape of Msrshal Bszsine from tbe ieland of St. Marguerite. The detaile of the manner in which he succeeded in gettiug away are nnknown, except that he got on board a vessel bound for Italy. The night was dark and etormy. The journals declare that the Government will act promptly and energetically in punishing all who connived at his flight.

NAVAL OFFICEAS TO COMMANN THE P. M. Co.'e STEAMEAS.—The P. M. Co. has made application to the Secretary of the Navy fot an aseignment of naval officers to command their ahips, believing that such offioers can best maintain discipline. The next eession of Congress will probably indorse the company'e application and recommend that euoh authority to make assignment be given him.

GONE TO LONDON.—Secretary Belknap has gone to London for a short visit.

THE ANTICIPATEN WINE PAONUOT.—There is a wide varisnce hetween the estimates formed of the wine that California will produce the present season. Some put the estimate ae high as 10,000,000 gallons, while others bring it down to 6,000,000. It is generslly oonceded that there are grspes enough now growing to make 15,000,000 gallons of wine; but the demand will not warrant the making of this amount. A large amount of the grape yield of the present eeason must, nnavoidably, go to waste, after the wine vats, the raisin boxes snd the fruit dishes of the country have heen supplied to their fullest capacity or demands. Those who are engaged in wine-msking are, like all California producers, striving for excellence. The native grape is being rapidly replaced by foreign varieties, both by planting and grafting; snd no efforts are heing epared to establish a world-wide reputation for California wine.

WAA IMMINENT BETWEEN RUSSIA ANN CHINA. News hae reached Berlin that China hss pushed forward 190,000 picked troops to the Kashgar frontier, and in addition, placed large garrisons in the towns of Barkerel, and Chinese troops have moreover been concentrated in the north in Tarbakati, Keldo, and Olyosutia, which csn be readily made available for war with Kaehgar. It is proposed to attack the latter country simultaneously from two sides. At St. Petersburg it is believed thst in that event Russia would at once come to the assietance of Kashgar, since China ie known to be arming also for a war with Russia.

ASPIRANTE FOA THE PRESIDENCY.—There is beginning to he active discussion among the political papers with reference to candidatee for the next Presidency. General Sherman is urged b the Democrats, and Chief Jnstice Waite and Secretary Bristow are named by the Republicans. The third-term project of Gen. Grant eeems to meet with very little favor.

INFERIOA MATERIAL IN POSTAL CARUS.—It is claimed that the contrsctors for furniahiug postal cards have never yet come np to the oontract requiremeut in the qnality of that artiole. To sllow the present oompany to go on furnishing inferior cards is regarded as an injustice to the other companies which bid for the contract.

FELL FAOM A BRINGE.—While two men were crossing a bridge at Maunch Chunk, Ps., on Sturday last, the horse took fright, backed the buggy off the eame, threw out both men, who fell a distance of 35 feet. One was killed, the other escaped without serioue injury, while the horse managed to hold to the bridge with the huggy.

INDIAN ATAOCITIES.—A gang of eight Indians attacked an emigrsnt train, near Medicine Bow, on the Laramie plains, week before laet, but were repulsed, with the lose of one redskin. The bodies of 12 victims of the recent Indian outrages on the Dry Cimarron, have been found and buried.

SAN FRANOISCO'S NEW ENGINEER.—Mr. T. R. Scowden, who has recently been elected eugineer for the city aud county of San Francieco, ie a new-comer here, but brings with him, not only a clean record, but a reputation for msrked ability in his profeesion. He will have ample opportunity to display hie ahilities here.

KILLED HIS WIFE FAOM JEALOUSY.—Joeeph Elwell, a carpenter of Green Point, near Brooklyn, L. I., on the 9th inst. stabbed his wife six times with a large claep knife, inflicting a probably fstal wound. Jealousy was the canse. Elwell bas been arrested.

SPAIN.—The internecine war in Spain is without much chsnge; both parties are confident, but the report that the great powere have decided to aoknowledge the Republic, seems to show that confidence abroad ie well settled in that direction.

COMMUNISTS AAAESTEU.—Eight hnndred and six persons, formerly connected with the Commune, have been arrested at Marseilles, among whom are M. Esquirss, ex-Prefect of the Department.

BETTEA MAIL SEAVIOE.—The Poet-office Department has ordered a third trip per week on the mail route from Nspa City to Knoxville, Cal., and a third trip per week on the route from San Luis Obispo to Cambria.

CHAALIE ROSS.—On the tenth inetant, a womsn was arrested at Bennington, Vt., having in chsrge a child answering to the description of Charlie Rose.

POLITICAL QUARAEL.—Some unknown person shot and fatslly wounded A. C. Burton, colored candidate for the Legislatnre in Memphia, Tenn.

THE "PAT ROGERS" DISASTEA.—Forty persone are known to have been lost by the burning of the eteamboat "Pat Rogere." Of these, thirty-five have been recovered.

VESSEL MISSING.—Some anxiety is felt at the non-arrival of a vessel which left Norway July 2d, with one hundred families from Iceland for Halifax.

WORK has been commenced on the Guadaloupe quicksilver mine, Monterey oounty. Parties have agreed to open and work the mine for a one-third interest.

THE English Co., which bought the old Brogan claim at Gold Run, have been engaged in sinking a shaft, finding abundant evidence of the richness of their claim.

NEW and important digginge have lately been discovered on the west bank of the Feather river, five miles from Dogtown, Butte county.

The great flume of the Butte Flume and Lumber Co. is drawing near completion. It is calculated that from 50,000 to 75,000 feet of lumber will be floated from the mills to Chico each day.

The new road from San Diego to the Julian mines, via Stonewall, is now open. The distance is shortened 15 miles, and a mail stage line has been put on.

An extensive vein of coal has been discovered upon the Avilla grant, San Luis Obispo county.

At the picnic of the Miners' Union to Washoe Valley on Saturday, 8th inst., there were 3,000 people.

Steel rails for the Central Pacific Railroad track over the Sierras are arriving daily from Chicago.

The gold mining fever is increasing at Los Angeles, and specimens are brought in daily from various quarters.

The hydraulic works at the Sierra Nevada mine are only running on half time, owing to the scant supply of water.

Promising gold and silver mines have been discovered within three miles of San Fernando, Los Angeles county.

The Carson *Tribune* wants a quartz mill erected in that town.

Coal was last week discovered in a branch of the San Lorenzo creek.

The Manzanita mine, Nevada county, cleaned up recently $20,000.

On last Saturday night 142 flasks of quicksilver were shipped from Napa.

Chinamen are leaving Oroville in numbers. They can't make the lava beds pay.

Mining is brisk in the vicinity of Klamath river.

About 40 men have summered at the Yakima mines.

The new incline machinery of the Crown Point uses up four cords of wood per day.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Aug. 11th, 1874.

For Week Ending July 28th, 1874."

Movable Dam.—Barzillar Cottle, S. F., Cal.

Apparatus for Condensing Quicksilver.—Ferdinand Fiedler and Jas. B. Randol, New Almaden, Cal.

Stove-Lid Lifter and Stand.—Samuel Hill, S. F., Cal.

Clip for Whiffletrees.—Willard N. Santee, Dalles, Oregon.

Derrick.—Elias O. Long, Farmington, Cal.

Process of Manufacturing Hard Sugar.—Claus Sprockels, S. F., Cal.

——"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

PACIFIC RURAL PRESS,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, $4 a year.

DEWEY & CO., Publishers,
No. 224 Sansome street, - - SAN FRANCISCO

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the Mining and Scientific Press Office, by

DEWEY & CO.

Plainfield, July 4th, 1874.

Messrs. Dewey & Co.—*Dear Sirs:* I acknowledge receipt of yours of 2d inst., inclosing my Letters Patent. I thank you for the interest you have taken in obtaining the same. Yours truly, M. W. OOON.

METALS.

Wednesday M., August 12, 1874.

Quicksilver is very firm at $1.45 ₱ lb. An editorial in a daily contemporary commenting on the advance to $1.60 was therefore premature, the local price not having changed. It is possible that there may be still another rise, as certain dealers hold the avowed intention of driving it up to $1.50, but from the encouraging outlook for future supplies, there does not seem any ground for the fear that it will go beyond, if it touches that figure—at least for a long time. Trade is quiet in other Metals, and in Lead is dull.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

Anaheim, July 30, 1874.

Messrs. Dewey & Co.—*Gentlemen:* Owing to temporary absence I have been unable to acknowledge the receipt of Letters Patent for my "Traneplanter," up to this time. I take this opportunity to hear witness to the efficient manner in which everything connected with your Patent Agency is conducted, and also the uniform courtesy and kindness I experienced at your hands. I mean to advertise the "Transplanter" in the Pacific Rural Press. Yonre reepectfully,

Timothy Carroll.

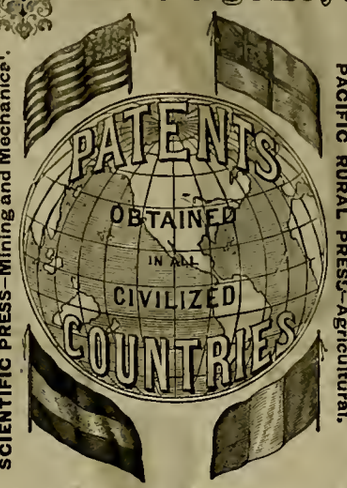
HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Government fees, practical hints, etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

New Inventions!

Of real merit, if brought plainly before the public when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the Press. Superior Engravings Made, at reasonable rates, by artists in this office. hp-tf

The Mining and Scientific Press, San Francisco, Cal., Dewey & Co., is a rich *placer*, wherein golden information may be found, valuable to any searcher after knowledge.—*Newark Manufacturer.*

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.



Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasone of long establishment, great experience, thorough system, and intimate acquaintance with the enhjects of inventione in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Mining and Scientific Press. We transact every branch of Patent soliciting business, obtaining Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free.

DEWEY & CO.,
Publishers, Patent Agents and Engravers,
No. 224 Sansome st., San Francisco, Cal.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Eagle Quicksilver Mining Company.—Location of works, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

Notice.—Is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 1874, an assessment, No. 8, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessment shall remain unpaid on Monday, the 21st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 28th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Rooms 5 and 6, No. 302 Montgomery street, San Francisco. jy-25

El Dorado North Mining Company.—Location of principal place of business, 215 Sansome street, room No. 2, San Francisco, Cal. Location of works, Philadelphia District, Belmont, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of August, 1874, an assessment (No. 1) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 215 Sansome street, room 2, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on sixth (6th) day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors. GEO. E. HOUGHTON, Secretary.

Office—No. 215 Sansome street, San Francisco, Cal. ag15

Electric Mining Company—Location of principal place of business, San Francisco, State of California.

And in accordance with law, and an order of the Board of Directors, made on the 23d day of July, 1874, so many shares of each parcel of each stock as may be necessary will be sold at public auction at the company's office, 411½ California street, Room 3, San Francisco, on Saturday, the 15th day of August, 1874, at the hour of 2 o'clock P. M., of each day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

E. E. RICE, Secretary.

Office—Room 3, 411½ California street, San Francisco, California.

Germania Mining Company—Location of principal place of business, San Francisco, State of California. Location of works, Tintic District, Juab County, Utah Territory.

Notice is hereby given that at a meeting of the Directors, held on the fifth (5th) day of August, 1874, an assessment (No. 2) of one dollar per share was levied upon the capital stock of the company, payable immediately, to the Secretary, at the office of the Company, 408 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the second (2d) day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. J. W. TRIPP, Secretary.

Office—No. 408 California street, room 16, San Francisco, Cal. ag15

Plumbago Gold Mining Company—Certificate of incorporation dated and filed in the office of the County Clerk of the City and County of San Francisco, California, June 24, 1864, No. 3340. Mine and works at Plumbago Ledge, Sierra County, Cal.

To all whom it may concern to know: The representatives of two-thirds (⅔) of the capital stock and stockholders of said corporation, having made and filed with the Board of Trustees, on the 4th day of August, 1874, their written assent that the place of business of said corporation should be changed from the City and County of San Francisco, to Minnesota, in Forest Township, Sierra County, Cal.

Notice is hereby given, that it is the intention of said corporation to remove its principal place of business from the City and County of San Francisco, to Minnesota, in Forest Township, in Sierra County, immediately after publication of this notice for the period of thirty days from its first insertion in the Mining and Scientific Press, a newspaper printed and published in the City and County of San Francisco, Cal. Done by order of the Board of Trustees. S. B. DAVIDSON,
Secretary Pro. Tem.
August 4, 1874. 6w29-1m

Providence Gold and Silver Mining Company—Location of principal place of business, San Francisco, State of California. Location of works, Hayden Hill, Lassen County.

Notice is hereby given, that at a meeting of the Directors, held on the 10th day of July, 1874, an assessment (No. 1) of Ten Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 331 Montgomery street, room 18, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 17th day of August, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the seventh day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WM. H KNIGHT, Secretary.

Office—No. 331 Montgomery street, room 18, San Francisco, California. jy18

Virginia Consolidated Mining Company.

Principal place of business, San Francisco, State of California. Location of works, Kearsarge Mining District, Inyo County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of July, 1874, an assessment of seven cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company in San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 30th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

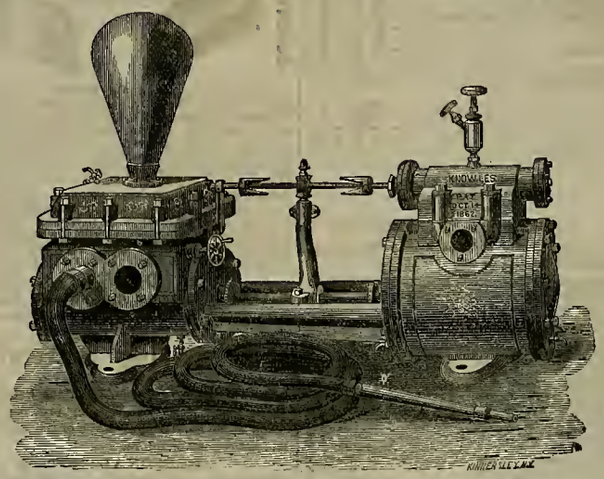
KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowlee Steam Pump—Dear Sir: In reply to your inquiry as to the merits of the Knowlee Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 20 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours, truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

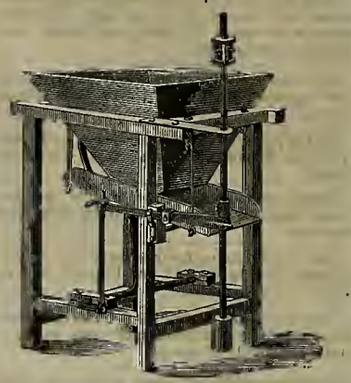
Machinery.

Tulloch's Automatic Ore Feeder.



At the request of Mr. Jas. Tulloch, we have carefully examined his patent Ore Feeder for Quartz Mills, now on exhibition in this city at the Pacific Foundry, and in view of its simplicity of construction, directness of action, durability and compactness, as well as its small weight and the low price at which they are held by the patentee, so as to place them within reach of all mill owners, are free to state our unqualified opinion that we regard it superior to any Ore Feeder of which we have any knowledge in actual work. We are confirmed in this opinion by the severe tests to which it has been put, doing its work thoroughly well on ores of all kinds. We find the delivery to the mortars of the ore-stuff, whether dry, damp or wet, to be entirely uniform and regular, and that even slimes and slush can be worked in them under perfect control.

The above data apply to the Regular sizes only. All these pumps have *Brass Valve Seats and Brass Water Pistons.* Pumps when fitted with brass cost extra. We have many supplementary sizes.

LONG STROKE PUMPS, { No. 4, 24-in. Stroke, $; No. 5, 24-in. " $; No. 6, 30-in. Stroke, $; No. 7, 30-in. Stroke, $; No. 8, 36-in. " $

These Long Stroke Pumps have large free openings, and are highly esteemed *for draining mines.*

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

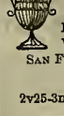
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merite.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operatss as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco

Important to Miners and Mill Men.

Silver-Platsd Copper Amalgamating Plates, for Saving Gold.



Of all sizes and in any quantity, furnished to order. Full instructions sent for operating.
Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.

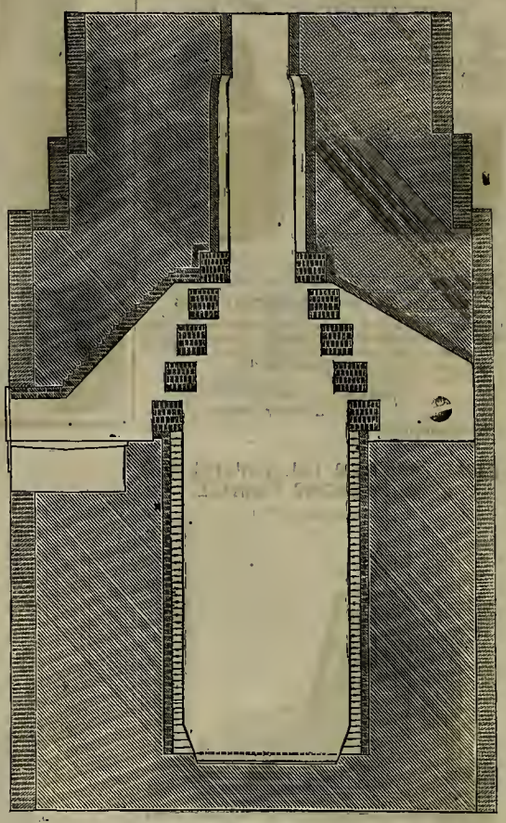

Fig. 2.—Out Transversely from Fig. 1.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering four sizes of ore to four rows of sieves, each; row independent of the other, and each having sieves, each row concentrating according to specific gravity; the special size automatically fed into it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter, galena and silver sulphurets from pyrites, baryta and quartz, and pyrites from quartz.

Added to a battery of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirement of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,
